#2431 Hospital-level, risk-standardized payment associated with a 30-day episode-of-care for Acute Myocardial Infarction (AMI), Last Updated: Dec 09, 2013

Resource Use Measure Information Form 2.1

This form contains the information submitted by measure developers/stewards, organized according to NQF's measure evaluation criteria and process. For more information about Resource Use Measures and the Resource Use measure evaluation criteria, please visit the Cost & Resource Use Project Page

Brief Measure Information

NQF #: 2431
De.2. **Measure Title:** Hospital-level, risk-standardized payment associated with a 30-day episode-of-care for Acute Myocardial Infarction (AMI)
Co.1.1. **Measure Steward:** Centers for Medicare and Medicaid Services
De.3. **Brief Description of Measure:** This measure estimates hospital-level, risk-standardized payment for an AMI episode-of-care starting with inpatient admission to a short term acute-care facility and extending 30 days post-admission for Medicare fee-for-service (FFS) patients who are 65 years of age or older with a principal discharge diagnosis of AMI.

S.2. **Type of resource use measure:** Per episode **If Other:**
S.3. **Level of Analysis:** Facility
S.4. **Target Population Category:** Senior Care
S.5. **Data Source**: Administrative claims
S.9.6. **Costing method:** Standardized pricing

S.7.7. **Resource Use Service Categories (Units)**: Inpatient services: Inpatient facility services; Inpatient services: Evaluation and management; Inpatient services: Procedures and surgeries; Inpatient services: Imaging and diagnostic; Inpatient services: Lab services; Inpatient services: Admissions/discharges; Inpatient services: Labor (hours, FTE, etc.); Ambulatory services: Outpatient facility services; Ambulatory services: Emergency Department; Ambulatory services: Evaluation and management; Ambulatory services: Procedures and surgeries; Ambulatory services: Imaging and diagnostic; Ambulatory services: Lab services; Ambulatory services: Labor (hours, FTE, etc.); Durable Medical Equipment (DME); Other services not listed **If other:** See S.7.8 for a full list of care settings included

IF Endorsement Maintenance – Original Endorsement Date: Most Recent Endorsement Date:

1. Importance to Measure and Report

Resource use measures will be evaluated based on the extent to which the specific measure focus is important to making significant contributions toward understanding healthcare costs for a specific high-impact aspect of healthcare where there is variation or a demonstrated high-impact aspect of healthcare (e.g., affects large numbers, leading cause of morbidity/mortality, variation in resource use [current and/or future], severity of illness, and patient/societal consequences of poor quality) or overall poor performance. Candidate consensus standards must be judged to be important to measure and report in order to be evaluated against the remaining criteria.

IM.1. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

IM.1.1. **Demonstrated High Priority Aspect of Healthcare:**
High resource use
If other:

IM.1.2. **Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare: List citations in IM.1.3.**
In 2012 total Medicare expenditures were $574.2 billion, representing 3.6% of gross domestic product (GDP). Current estimates suggest that Medicare spending will increase to 5.6% of GDP by 2035 due to both an increase in the Medicare population as well as Medicare spending on each beneficiary [1]. The growth in Medicare spending is unsustainable and highlights the need to create incentives for high value care. A critical first step in moving toward high value care is to define an approach to calculate costs that is transparent to consumers and fair to providers.
AMI is a condition with a substantial range in costs of care and for which there are well-established publicly reported quality measures; therefore, it is an ideal condition for assessing relative value for an episode of care that begins with an acute hospitalization. Moreover, AMI is one of the leading cause of hospitalization for Americans over 65 years old and costs the US roughly $18 billion annually [2]. Medicare payments are difficult to interpret in isolation. Some high payment hospitals may have better clinical outcomes when compared with low payment hospitals; other high payment hospitals may not. For this reason, the value of hospital care is more clearly assessed when pairing hospital payments with hospital quality.
A measure of payments for Medicare patients during an episode of care for AMI aligned with current quality of care measures will facilitate profiling hospital value (payments and quality). This measure, which uses standardized payments, reflects differences in the management of care for patients with AMI both during hospitalization and immediately post-discharge. By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care.

Citations available in the Appendix

IM.2. Opportunity for Improvement

Demonstration of resource use or cost problems and opportunity for improvement, i.e., data demonstrating variation in the delivery of care across providers and/or population groups (disparities in care).

IM.2.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in performance envisioned by use of this measure.):*
This measure is aligned with current quality measures to facilitate profiling hospital value (payments and quality). Given that AMI is a condition with substantial variability in costs of care, aligning this payment measure with quality measures will allow the assessment of hospital value. By evaluating their RSPs and RSMRs for AMI, hospitals have an opportunity to consider actionable improvements and efficiencies on a broader scale to impact value of care. Specifically, hospitals would be able to understand the drivers of costs for their own patients over a 30-day episode of care.

IM.2.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, stddev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.)*
This information also will be used to address the subcriterion on improvement (U.2.1.) under Usability and Use:
A preliminary examination of the 30-day AMI risk-standardized mortality and risk-standardized payment measures showed high quality care (as measured by RSMR) at higher and lower relative costs. This finding illustrated that quality care can be provided at relative lower costs and that efficiencies of care can be optimized for AMI.
In our analysis of 180,562 Medicare FFS AMI patients, we found that both unadjusted and adjusted payments from AMI admission to 30 days post-admission vary considerably across hospitals. For hospitals with at least 25 cases, the hospital unadjusted AMI 30-day episode-of-care payment ranges from $12,282 to $37,482 across 1,846 hospitals with a median (interquartile range) of $19,683 ($17,880, $21,585). The mean ± SD hospital unadjusted payment is $19,799 ± $2,829. After adjusting for patient case mix, the risk-standardized payment at the hospital-level has a median (interquartile range) of $20,152 ($19,191, $21,211). The mean ± SD risk-standardized hospital payment is $20,207 ± $1,478, ranging from $15,251 to $27,317 across 1,846 hospitals.

IM.2.3. **If no or limited performance data on the measure as specified is reported in IM.2.2., then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement:**

3. Yasaitis L, Fisher ES, Skinner JS, Chandra A. Hospital quality and intensity of spending: is there an association? Health Aff (Millwood). Jul-Aug 2009;28(4):w566-572.

IM.2.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability.** *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.)* **This information also will be used to address the subcriterion on improvement (U.2.1.) under Usability and Use:**
Race
We conducted internal analyses to examine whether or not hospitals with higher percentages of African-American patients performed worse than their counterparts. There was little difference between hospitals with high and low percentages of African-American patients. The 2008 median RSP for hospitals with 0-2% (Quartile 1) African-American patients was $20,068, while the 2008 median RSP for hospitals with >20% (Quartile 4) of African-American patients was $19,817.
SES
We conducted internal analyses to examine whether or not hospitals with higher percentages of Medicaid patients performed worse than their counterparts. There was very little difference between hospitals with high and low percentages of Medicaid patients. The 2008 median RSP for hospitals with 0-10% (Quartile 1) Medicaid patients was $20,416, while the 2008 median RSP for hospitals with >30% (Quartile 4) of Medicaid patients was $19,946.

Citations available in the Appendix

IM.3. Measure Intent

The intent of the resource use measure and the measure construct are clearly described.
AND
The resource use service categories (i.e., types of resources/costs) that are included in the resource use measure are consistent with and representative of the intent of the measure.

IM.3.1. **Describe intent of the measure and its components/ Rationale (including any citations) for analyzing variation in resource use in this way:**
This measure is aligned with current quality measures to facilitate profiling hospital value (payments and quality). Given that AMI is a condition with substantial variability in costs of care, aligning this payment measure with quality measures will allow the assessment of hospital value. By evaluating their RSPs and RSMRs for AMI, hospitals have an opportunity to consider actionable improvements and efficiencies on a broader scale to impact value of care.

2. Reliability and Validity - Scientific Acceptability of the Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the cost or resources used to deliver care. **Measures must be judged** to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.

2a.1 Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Cardiovascular : Acute Myocardial Infarction

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Care Coordination

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.):*

S.2. **Type of resource use measure.** *(Select the most relevant):*
Per episode
If Other:

S.3. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED.):*
Facility

S.4. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any.):*
Senior Care

S.5. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED.)*: If other, please describe in S.5.1.
Administrative claims

S.5.1. **Data Source or Collection Instrument** *(Identify the specific data source or data collection instrument, e.g. name of database, clinical registry, collection instrument, etc.)*:
Chronic Condition Data Warehouse (CCW)
The CCW contains existing CMS beneficiary claims data from multiple care settings that can be linked by a unique patient identifier, allowing researchers to analyze individual patient data across the continuum of care. We used a 100% sample of all Medicare beneficiaries from 2008 who had an inpatient admission with a principal discharge diagnosis of AMI and met all cohort inclusion criteria.
The measure was developed using claims data from seven standard analytic files contained in the CCW data (inpatient, outpatient, skilled nursing facility, home health, hospice, carrier [physician/supplier Part B items], and durable medical equipment).
Medicare Enrollment Database (EDB)
This database contains Medicare beneficiary demographic, benefit/coverage, and vital status information. This dataset was used to obtain information on enrollment, date of birth, and post-discharge mortality status. These data have previously been shown to accurately reflect patient vital status [1].
Medicare Fee Schedules
Fee schedules are lists of pre-determined reimbursement amounts for certain services and supplies (e.g. physician services, independent clinical labs, ambulance services, durable medical equipment) and are used by Medicare in the calculation of payment to providers. We used the applicable fee schedules when calculating payments for claims that occurred in each care setting.
Federal Register Final Rules for Medicare Prospective Payment Systems and Payment Policies
Certain data necessary to calculate payments (e.g. annual base payments and conversion factors, DRG weights, wage indexes, and average length of stay) were taken from applicable Federal Register Final Rules.
CMS-published Wage Index Data
Wage index data not published in Federal Register Final Rules (such as the wage index data for Renal Dialysis Facilities) were obtained via the CMS website.

Construction Logic
S.7.1. **Brief Description of Construction Logic**
If applicable, summarize the general approach or methodology to the measure construction. This is most relevant to measures that are part of or rely on the execution of a measure system or applies to multiple measures:

This measure estimates hospital-level, risk-standardized payments for a 30-day episode of care for AMI. To this end, we constructed a cohort of AMI patients by examining the primary discharge diagnosis in administrative claims data. Specifically, we included Medicare fee-for-service patients 65 or older with a primary discharge diagnosis of 410.xx excluding 410.x2. We then applied several exclusion criteria as detailed in S.9.1. Once our cohort was finalized we examined all payments for these patients (including co-pays, co-insurance, and deductibles) that occurred within 30 days of the index admission. We included payments for all care settings, except Part D. We standardized payments across providers by removing or averaging geographic differences and removing policy adjustments from the total payment for that service. These payments were then assigned to the initial admitting hospital. As part of our model, we risk adjusted these payments for patient comorbidities listed in outpatient and inpatient claims in the 12 months prior to the index admission as well as the secondary diagnoses included in the index admission. We then used hierarchical generalized linear regression models to calculate a risk-standardized payment for each hospital.

S.7.2. **Construction Logic** *(Detail logic steps used to cluster, group or assign claims beyond those associated with the measure's clinical logic.):*
In order to construct the measure we use data from CMS's Chronic Condition Data Warehouse (CCW). The CCW data contain claims for all care settings, supplies, and services as outlined in Section S.7.8. Claim payments are clustered by the setting, supply, or service in which they were rendered. Specifically, we use the claim type, facility type, and place of service codes to assign payments. These payments are then assigned back to the patients. To create a hospital-level measure, we aggregate the payments for all eligible patients at each hospital.

CONSTRUCTION LOGIC ATTACHMENT or URL: If needed, attach supplemental documentation *(Save file as: S_7_2_Construction_Logic)*. All fields of the submission form that are supplemented within the attachment must include a summary of important information included in the attachment and its intended purpose, including any references to page numbers, tables, text, etc.

Click here to go to the Construction Logic Attachment or URL: *page numbers, tables, text, etc.*

S.7.3. **Concurrency of clinical events, measure redundancy or overlap, disease interactions** *(Detail the method used for identifying concurrent clinical events, how to manage them, and provide the rationale for this methodology.):*
Rationale: This measure examines payments for a 30-day episode of care beginning with an admission for AMI and extending to 30-days post-admission. We determine if a patient has an AMI by examining the primary discharge diagnosis code in the administrative data. If a patient has a primary discharge diagnosis of any other condition, even if this includes a secondary diagnosis of AMI, this admission is not considered as an index admission. Therefore, the concurrency of clinical events is not an issue when determining what triggers the episode of care. Once, an episode is triggered, however, we include payments for all care settings, except Part D. The model risk adjusts for comorbidities listed in outpatient and inpatient claims in the 12 months prior to the index admission as well as the secondary diagnoses included in the index admission that are not considered complications of care.

S.7.4. **Complementary services** *(Detail how complementary services have been linked to the measure and provide rationale for this methodology.):*
Rationale: The measure includes payments for all care settings, except Part D, that occur during the 30-day window. If a claim for a complementary service was filed in the study window, then it would be included in the measure.

S.7.5. **Clinical hierarchies** *(Detail the hierarchy of codes or condition groups used and provide rationale for this methodology.):*
Rationale: The measure uses a risk-adjustment model based on Condition Categories (CCs) as opposed to Medicare Advantage Hierarchical Condition Categories (HCCs). We used CCs because they provide detailed descriptions about comorbidities that may influence care decisions that affect payment for AMI without assigning hierarchy. This allows conditions that would be ranked lower in the hierarchy to be considered for risk adjustment if they are medically and statistically relevant. For example, it would allow for the inclusion of both HCC 34 (peptic ulcer, hemorrhage, other specified gastrointestinal disorders) and HCC 33 (inflammatory bowel disease) rather than only HCC 33, which is considered the more "severe" condition.

S.7.6. **Missing Data** *(Detail steps associated with missing data and provide rationale for this methodology (e.g., any statistical techniques to impute missing data):*
Rationale: We do not impute missing data for any of the variables included in the measure. However, if a hospitalization is missing a DRG or DRG weight we exclude it as an index admission.

S.7.7. **Resource Use Service Categories (Units)** *(Select all categories that apply):*
Inpatient services: Inpatient facility services; Inpatient services: Evaluation and management; Inpatient services: Procedures and surgeries; Inpatient services: Imaging and diagnostic; Inpatient services: Lab services; Inpatient services: Admissions/discharges; Inpatient services: Labor (hours, FTE, etc.); Ambulatory services: Outpatient facility services; Ambulatory services: Emergency Department; Ambulatory services: Evaluation and management; Ambulatory services: Procedures and surgeries; Ambulatory services: Imaging and diagnostic; Ambulatory services: Lab services; Ambulatory services: Labor (hours, FTE, etc.); Durable Medical Equipment (DME); Other services not listed
If other: See S.7.8 for a full list of care settings included

S.7.8. **Identification of Resource Use Service Categories (Units)** *(For each of the resource use service categories selected above, provide the rationale for their selection and detail the method or algorithms to identify resource units, including codes, logic and definitions.):*
To estimate payments for a 30-day episode of care for AMI we included payments for all care settings, services, and supplies, except Part D. We did not include Part D since a large proportion of Medicare beneficiaries are not enrolled in Part D and there is variation in enrollment status across and within states. Including payments for Part D services would thus bias payments upwards for hospitals with high Part D enrollment. By following patients through an episode of care for AMI, CMS and hospitals can gain key insights into the drivers of payments and how practice patterns vary across providers.
We include payments for the following care settings below in the measure:
Inpatient hospital facility and physician
Outpatient hospital facility and physician
Skilled nursing facility and physician
Hospice facility and physician
Home health facility and physician
Inpatient psychiatric facility and physician
Inpatient rehab facility and physician
Long-term care hospital facility
Clinical labs facility and physician
Comprehensive outpatient rehab facility and physician
Outpatient rehab facility and physician
Renal dialysis facility and physician
Community mental health centers facility and physician
DME/POS/PEN
Observation stay facility
Part B drugs
Ambulance and ambulance physician
Emergency department facility and physician
Physician office
Federally qualified health centers facility and physician
Rural health clinics facility and physician
Ambulatory surgical centers facility and physician
We also include physician payments for the following care settings:
Indian health service free-stand facility
Indian health service provider facility
Tribal free-standing facility
Tribal facility
Military treatment facility
Independent clinic
State or local health clinic
Mass immunization center
Walk-in retail health clinic
Urgent care facility
Unassigned
Pharmacy
School

Homeless Shelter
Prison
Group Home
Mobile Unit
Temporary Lodging
Birthing Center
Intermediary Care/Mentally Retarded
Residential Substance Abuse
Psychiatric Residential Facility
Non-Residential Substance Abuse
Other Physician
Other carrier claims with HCPCS codes P9603 or P9604
In order to determine how to assign claims, we examine the place of service code for physician claims and a combination of claim type and facility type codes to determine the facility in which care was provided. Depending on the facility and physician codes we standardize payments differently. Information on how we standardize claims can be found in section S.9.6.

If needed, provide supplemental resource use service category specifications in either URL (preferred) or as an attachment (Save file as S.7.8a_RU_Service_Categories)

Click here to go to the Resource Use Attachment :

Clinical Logic

S.8.1. **Brief Description of Clinical Logic** *(Briefly describe your clinical logic approach including clinical topic area, whether or not you account for comorbid and interactions, clinical hierarchies, clinical severity levels and concurrency of clinical events.)*
AMI is a common condition in the elderly with substantial variability in payments due to different practice patterns. Quality measures for AMI such as 30-day AMI risk-standardized mortality rate (RSMR) are already publicly reported. In the context of its publicly reported quality measures, AMI is an ideal condition in which to assess payments for Medicare patients and relative hospital value. Therefore we created a measure of payments for a 30-day episode of care for AMI that could be aligned with CMS's 30-day AMI mortality and readmission measures. This will allow CMS to assess the value of care provided for these episodes.
The measure uses Condition Categories (CCs) to adjust for patient case-mix across hospitals. Details of our risk-adjustment strategy can be found in our technical report at
https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228773321137.
This measure is for patients who are admitted with AMI. We determine this by examining the primary discharge diagnosis code in the administrative data. If a patient has a primary discharge diagnosis of any other condition, even if this includes a secondary diagnosis of AMI, this admission is not considered as an index admission. Therefore, the concurrency of clinical events is not applicable for this measure. However, the model does risk adjust for comorbidities listed in outpatient and inpatient claims in the 12 months prior to the index admission as well as the secondary diagnoses included in the index admission that are not considered complications of care.

S.8.2. **Clinical Logic** *(Detail any clustering and the assignment of codes, including the grouping methodology, the assignment algorithm, and relevant codes for these methodologies.)*
When considering hospital payments, we focused on a 30-day episode of care triggered by admission for AMI as identified using ICD-9 codes described in Section S.7.1. Specifically, we assigned all payments for the episode of care to the hospital that originally admitted the patient.

S.8.3. **Evidence to Support Clinical Logic Described in S.8.2** Describe the rationale, citing evidence to support the grouping of clinical conditions in the measurement population(s) and the intent of the measure *(as described in IM3)*
The intent of the measure is to estimate payments for a 30-day episode of care for AMI in order to gain insight into drivers of payment within and across hospitals. To profile hospital payments fairly, the measure fulfills the following criteria. First, we standardize payments for geography to isolate payment differences related to the clinical care of patients with AMI. Second, we adjust for hospital case-mix. Third, we align the AMI payment measure specifications with the nationally reported 30-day AMI risk-standardized mortality measure (RSMR) to identify practice patterns that may be expensive without conferring a quality benefit across an episode of care for AMI. Lastly, we focused on a specific disease condition to provide the most meaningful feedback to hospitals and incentivize targeted improvements in care.

S.8.3a. **CLINICAL LOGIC ATTACHMENT or URL:** If needed, attach supplemental documentation *(Save file as: S_8_3a_Clinical_Logic).* All fields of the submission form that are supplemented within the attachment must include a summary of important information included in the attachment and its intended purpose, including any references to page numbers, tables, text, etc.

Click here to go to the Clinical Logic Attachment:

S.8.4. **Measure Trigger and End mechanisms** *(Detail the measure's trigger and end mechanisms and provide rationale for this methodology):*
When considering hospital payments, we focused on a 30-day episode of care triggered by admission for AMI for several key reasons. First, hospitalizations represent brief periods of illness that require ongoing management post-discharge. Second, decisions made at the admitting hospital affect payments for care in the immediate post-discharge period. Third, attributing payments for a continuous episode of care to admitting hospitals may reveal practice variations in the immediate and extended care of the illness that can result in increased payments. Fourth, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, we designed the AMI payment measure to be aligned with AMI quality measures, i.e. CMS's publicly reported AMI mortality measure, which is reported 30 days after admission.

S.8.5. **Clinical severity levels** *(Detail the method used for assigning severity level and provide rationale for this methodology):*
Rationale: The measure uses administrative claims data to risk-adjust for patient comorbidities but does not include adjustments for clinical severity. Our team has demonstrated the validity of claims-based measures for profiling hospitals for a number of prior measures by comparing either the measure results or the individual data elements against medical records. CMS validated the six NQF-endorsed claims-based measures currently in public reporting (i.e., mortality and readmission measures for AMI, heart failure, and pneumonia) with models that used medical record-abstracted data for risk adjustment. Specifically, claims model validation was conducted by building comparable models using abstracted medical record data for risk adjustment for heart failure patients (National Heart Failure data), AMI patients (Cooperative Cardiovascular Project data) and pneumonia patients (National Pneumonia Project dataset). When both models were applied to the same patient population, the hospital risk-standardized mortality and readmission rates estimated using the claims-based risk-adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting.

S.8.6. **Comorbid and interactions** *(Detail the treatment of co-morbidities and disease interactions and provide rationale for this methodology.):*
Rationale: The goal of risk adjustment for this measure is to account for patient age, prior procedures (e.g., PCI and/or CABG), and comorbid conditions that are clinically relevant and have strong relationships with the outcome, while illuminating important payment differences between hospitals.
Comorbidities that are included in risk adjustment are identified in administrative claims during the 12 months prior to and including the index admission. To assemble the more than 15,000 ICD-9 codes into clinically coherent variables for risk-adjustment, the measure employs the publicly available CMS condition categories (CCs) to group ICD-9 codes into CCs [1], and selects comorbidities on the basis of clinical relevance and statistical significance.

Adjustments for Comparability – Inclusion/Exclusion Criteria

S.9.1. **Inclusion and Exclusion Criteria Detail initial inclusion/exclusion criteria and data preparation steps** *(related to clinical exclusions, claim-line or other data quality, data validation, e.g. truncation or removal of low or high dollar claim, exclusion of ESRD patients):*
Rationale: The measure includes admissions for Medicare FFS beneficiaries aged >=65 years discharged from non-federal acute care hospitals, having a principal discharge diagnosis of AMI.
CMS FFS beneficiaries with an index hospitalization to an acute care non-federal hospital are included if they have been enrolled in Part A and Part B Medicare for the 12 months prior to the date of admission to ensure a full year of administrative data for risk-adjustment.
For patients with more than one admission in a given year for a given condition, only one admission is randomly selected to include in the cohort as an index AMI.
The episode of care begins with an admission for AMI to a short-term acute care hospital. The hospital that initially admits the patient is assigned all payments that occur during the episode of care. This includes payments for patients who are subsequently

transferred to another hospital for further care of the index AMI. Claims from an emergency department do not begin the episode of care because CMS does not classify emergency department care as an inpatient admission. If a patient is transferred from an emergency department to another hospital and then subsequently admitted, the episode of care begins with the inpatient admission at the receiving hospital.

ICD-9-CM codes that define the patient cohort:

410.00 AMI (anterolateral wall) – episode of care unspecified
410.01 AMI (anterolateral wall) – initial episode of care
410.10 AMI (other anterior wall) – episode of care unspecified
410.11 AMI (other anterior wall) – initial episode of care
410.20 AMI (inferolateral wall) – episode of care unspecified
410.21 AMI (inferolateral wall) – initial episode of care
410.30 AMI (inferoposterior wall) – episode of care unspecified
410.31 AMI (inferoposterior wall) – initial episode of care
410.40 AMI (other inferior wall) – episode of care unspecified
410.41 AMI (other inferior wall) – initial episode of care
410.50 AMI (other lateral wall) – episode of care unspecified
410.51 AMI (other lateral wall) – initial episode of care
410.60 AMI (true posterior wall) – episode of care unspecified
410.61 AMI (true posterior wall) – initial episode of care
410.70 AMI (subendocardial) – episode of care unspecified
410.71 AMI (subendocardial) – initial episode of care
410.80 AMI (other specified site) – episode of care unspecified
410.81 AMI (other specified site) – initial episode of care
410.90 AMI (unspecified site) – episode of care unspecified
410.91 AMI (unspecified site) – initial episode of care

Note: We do not include 410.x2 (AMI, subsequent episode of care)

ICD-10-CM codes that define the patient cohort:

I2109 ST elevation (STEMI) myocardial infarction involving other coronary artery of anterior wall
I2109 ST elevation (STEMI) myocardial infarction involving other coronary artery of anterior wall
I2109 ST elevation (STEMI) myocardial infarction involving other coronary artery of anterior wall
I2109 ST elevation (STEMI) myocardial infarction involving other coronary artery of anterior wall
I2119 ST elevation (STEMI) myocardial infarction involving other coronary artery of inferior wall
I2119 ST elevation (STEMI) myocardial infarction involving other coronary artery of inferior wall
I2111 ST elevation (STEMI) myocardial infarction involving right coronary artery
I2111 ST elevation (STEMI) myocardial infarction involving right coronary artery
I2119 ST elevation (STEMI) myocardial infarction involving other coronary artery of inferior wall
I2119 ST elevation (STEMI) myocardial infarction involving other coronary artery of inferior wall
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I214 Non-ST elevation (NSTEMI) myocardial infarction
I214 Non-ST elevation (NSTEMI) myocardial infarction
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I2129 ST elevation (STEMI) myocardial infarction involving other sites
I213 ST elevation (STEMI) myocardial infarction of unspecified site
I213 ST elevation (STEMI) myocardial infarction of unspecified site

Excluded Populations:

For the development of the measure we excluded admissions for patients:

- with fewer than 30 days of post-admission enrollment in Medicare FFS (because this is necessary in order to identify the outcome (payments) in the dataset over our analytic period);
- with a same or next day discharge where the patient did not die or was not transferred to another acute care facility (because these patients likely did not suffer a clinically significant AMI)
- who transferred in from another acute care facility (the acute episode is included in the measure but episode-of-care

payments are assigned to the hospital where the patient was initially admitted rather than the hospital receiving the transferred patient)

- who are transferred to federal hospitals (because we do not have claims data for these hospitals, thus including these patients would cause payments to be underestimated)
- with missing, irregular, or unknown patient vital status
- who have unreliable data (e.g., age over 115)
- who were discharged against medical advice (because hospitals had limited opportunity to implement high quality care)
- discharged from Maryland and US Territories hospitals (since these hospitals are not paid under the IPPS)
- with missing diagnosis-related group (DRG) or DRG weight for their index admission (because we cannot calculate a payment for these patients' index admission; this would make the entire episode of care appear significantly less expensive)

Since the development of the measure we subsequently added a new year of data (2009) and refined the measure cohort to:

- include admissions discharged from Maryland and US Territories hospitals (since the development of the measure these admissions are now included and treated as if they were paid under the IPPS)
- exclude admissions for patients who had a hospice assignment within 12 months prior to or on the date of index admission (since the development of the measure we decided to add this exclusion criterion in order for the AMI payment and AMI 30-day mortality measure cohorts to be aligned as closely as possible)
- exclude admissions within 30 days of a prior index admission (this exclusion criterion is applied after one admission per patient per year is randomly selected and so it is only applicable when multiple years of data are used)

Adjustments for Comparability – Risk Adjustment

S.9.2. **Risk Adjustment Type** *(Select type):*

Statistical risk model

If other:

S.9.3. **Statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables.):*

The model uses hierarchical generalized linear regression models. The final risk factor variables are:

Demographic

Age (measured as a categorical variable: 65 – 74, 75 – 84, >=85)

Cardiovascular

History of PCI

History of CABG

Congestive Heart Failure (CC 80)

Angina Pectoris/Old Myocardial Infarction (CC 83)

Heart Infection/Inflammation, Except Rheumatic (CC 85)

Valvular and Rheumatic Heart Disease (CC 86)

Congenital cardiac/circulatory defect (CC 87-88)

Hypertension and Hypertension Complications (CC 89-91)

Other Comorbidity

Metastatic Cancer and Acute Leukemia and Other Major Cancers (CC 7-8)

Diabetes and Diabetes Complications (CC 15-19, 119-120)

Protein-Calorie Malnutrition (CC 21)

Other Significant Endocrine and Metabolic Disorders (CC 22)

Obesity/Disorders of Thyroid, Cholesterol, Lipids (CC 24)

Other Gastrointestinal Disorders (CC 36)

Osteoporosis and Other Bone/Cartilage Disorders (CC 41)

Iron Deficiency and Other/Unspecified Anemias and Blood Disease (CC 47)

Delirium and Encephalopathy (CC 48)

Dementia (CC 49)

Drug/Alcohol Psychosis (CC 51)

Drug/Alcohol Abuse/Dependence (CC 52-53)

Severe Mental Illness (CC 54-55)

Reactive and Unspecified Psychosis (CC 56)

Depression/Anxiety (CC 58-59)

Precerebral Arterial Occlusion and Transient Cerebral Ischemia (CC 97)

Vascular Disease and Complications (CC 104-105)
Other Lung Disorders (CC 115)
Legally Blind (CC 116)
Dialysis Status (CC 130)
Internal Injuries (CC 160)

S.9.4. **Detailed Risk Model Specifications** available at measure-specific Web page URL identified in S.1 OR in attached data dictionary/code list Excel or csv file:
Available at measure-specific web page URL identified in S.1

S.9.5. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets):*
The measure is not stratified.

Adjustments for Comparability – Costing Method

S.9.6. **Costing method (***Detail the costing method including the source of cost information, steps to capture, apply or estimate cost information, and provide rationale for this methodology.):*
Standardized pricing

S.9.6a. **Describe the Costing method:**
Medicare pays for health care services using a number of different payment systems that are generally organized by delivery setting. These payment systems consider not only the products the Medicare patient is buying in each setting, but also the characteristics of the care provider, the extent to which the same product may be furnished in different settings, and the market circumstances that affect providers' costs. Information on CMS reimbursement rates for each care setting are made publicly available through either Final Rules published in the Federal Register or fee schedules provided on the CMS website. We use these data along with the payment information in the CCW data to standardize payments across providers by removing or averaging geographic differences and policy adjustments in payment rates for individual services from the total payment for that service. Please see Appendix D in the technical report for a full description of how we standardize payments for each care setting:
https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228773321137.

S.9.6b. **Attach pricing table here** *(Select Actual Prices Paid, Relative Value Units [RVUs], Other, or We do not provide specifications for a costing method):*
If other:
If not provided:

Click here to go to the Pricing Table: S.9.6b_Standardized_Pricing_Table.pdf

Adjustments for Comparability – Scoring

S.10. **Type of Score** *(Select the most relevant):*
Continuous variable
If other:

Click here to go to the sample score report:

S.11. **Interpretation of Score** *(Classifies interpretation of a ratio score(s) according to whether higher or lower resource use amounts is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score, etc.):*
Results of the measure alone do not necessarily reflect the quality of care provided by hospitals but simply whether the total episode payments are lower or higher than would be expected for a hospital with a similar case mix. Hospitals are classified as lower than average, no different than average, or higher than average payment as compared to national average payment for an episode. Accordingly, a classification of lower than average payment should not be interpreted as better care. The AMI RSP is most meaningful when presented in the context of another AMI outcome measure, such as the publicly reported 30-day AMI mortality measure. This is because a measure of payments to hospitals that is aligned with current quality of care measures facilitates profiling hospital value (payments and quality).

S.12. **Detail Score Estimation** *(Detail steps to estimate measure score.):*
The RSP is calculated as the ratio of "predicted" AMI payment to expected AMI payment, multiplied by the national unadjusted average AMI payment. The expected AMI payment for each hospital is estimated using its patient mix and the average of the hospital-specific intercepts. The predicted AMI payment for each hospital was estimated given the same patient mix but an estimated hospital-specific intercept. Operationally, the expected AMI payment for each hospital is obtained by summing the expected AMI payments for all patients in the hospital. The expected AMI payment for each patient is calculated via the hierarchical model by applying the subsequent estimated regression coefficients to the observed patient characteristics and adding the average of the hospital-specific intercepts. The predicted AMI payment for each hospital is calculated by summing the predicted AMI payments for all patients in the hospital. The predicted AMI payment for each patient is calculated through the hierarchical model by applying the estimated regression coefficients to the patient characteristics observed and adding the hospital-specific intercept.

Reporting Guidelines

S.13.1. **Describe discriminating results approach. Detail methods for discriminating differences** *(reporting with descriptive statistics--e.g., distribution, confidence intervals.):*
The measure reports a point estimate along with the 95% confidence interval for that point estimate. Hospitals are classified as lower than average, no different than average, or higher than average payment depending on where their confidence interval lies in comparison with the national average payment amount. In order for a hospital to be classified as lower than average the entire confidence interval has to be lower than the national average payment. To be classified as higher than average, the entire confidence interval must be higher than the national average payment. If any portion of the confidence interval overlaps with the national average, then the hospital is classified as average.

S.13.2. **Detail attribution approach. Detail the attribution rules used for attributing resources/costs to providers** *(e.g., a proportion of total measure cost or frequency of visits during the measure's measurement period)* **and provide rationale for this methodology:**
The measure attributes all payments incurred during the 30-day episode to the original admitting hospital. We assign all payments to the admitting hospital because decisions made at the admitting hospital affect payments for care in the inpatient setting as well as the immediate post-discharge period. Furthermore, attributing payments for a continuous episode of care to admitting hospitals may reveal practice variations in the full care of the illness that can result in increased payments. For patients who are admitted and then transferred to another hospital during the original index admission, we assign all payments to the original admitting hospital since this hospital is responsible for the initial care decisions and the decision to transfer the patient.

S.13.3. **Identify and define peer group. Identify the peer group and detail how peer group is identified and provide rationale for this methodology:**
As part of the measure methodology we compare payments for a hospital with the expected payment amounts for an average hospital with the same case-mix. While we include all hospitals when estimating the risk-adjustment model, we do not calculate RSPs for hospitals with fewer than 25 cases total, since estimates for hospitals with fewer cases are less reliable, and CMS's past approach to public reporting has been not to report these results.

S.13.4. **Sample size. Detail the sample size requirements for reporting measure results:**
In order for hospitals to be reported on, they must have at least 25 index AMI cases during the measurement period.

S.13.5. **Define benchmarking and comparative estimates. Detail steps to produce benchmarking and comparative estimates and provide rationale for this methodology:**
Comparative estimates are provided by classifying hospitals as lower than average, no different than average, or higher than average payment depending on where their confidence interval lies in comparison with the national average payment amount (i.e., the benchmark). To categorize hospital payments, we estimate each hospital's RSP and the corresponding 95% interval estimate. As with all estimates, there is a degree of uncertainty associated with the RSP. The interval estimate is a range of probable values around the RSP that characterizes the amount of uncertainty associated with the estimate. A 95% interval estimate indicates that there is 95% probability that the true value of the RSP lies between the lower limit and the upper limit of the interval. In an effort to provide fair comparisons providing three categories (lower than, no different than, or higher than the national average payment amount) allows for conservative discrimination of hospital RSPs.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
AMI_Payment_NQF_Testing_Form-635221963595535045.docx

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

F.1. Data Elements Generated as Byproduct of Care Processes.

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

F.1.1. **How are the data elements needed to compute measure scores generated?** *(Check all that apply):*
Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims)
If other:

F.2. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

F.2.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields):*
ALL data elements are in defined fields in electronic claims

F.2.2. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL:**

F.3. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

F.3.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues:**
Using administrative claims variables for risk-adjustment:
This measure uses variables from claims data submitted by hospitals for payment, data from Medicare fee schedules, data from Final Rules for Medicare prospective payment systems and payment policies, and CMS-published wage index data. Prior research has demonstrated that administrative claims data can be used to develop risk-adjusted outcomes measures for both mortality and readmission following hospitalization for acute myocardial infarction [1,2], heart failure [3,4], and pneumonia [5,6], and that the models produce estimates of risk-standardized rates that are very similar to rates estimated by models based on medical record data. This high level of agreement supports the use of the claims-based risk-adjusted models for public reporting. The models have also demonstrated consistent performance across years of claims data.
The approach to gathering risk factors for patients also mitigates the potential limitations of claims data. Because not every diagnosis is coded at every visit, for Medicare FFS patients we use inpatient, outpatient, and physician claims data for the year prior to admission, and diagnosis codes during the index admission, for risk-adjustment. The 1-year time frame provides a more comprehensive view of patients' medical histories than is provided by the secondary diagnosis codes from the index hospitalization alone. If a diagnosis appears in some visits and not others, it is included, minimizing the effect of incomplete coding. We were careful, however, to include information about each patient's status at admission and not to adjust for possible complications of the admission. Although some codes, by definition, represent conditions that are present before admission (e.g. cancer), other codes and conditions cannot be differentiated from complications during the hospitalization (e.g. infection or shock). If these are secondary diagnoses coded only in the index admission, then they are not adjusted for in the analysis.

F.3.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm.):*
There are no fees associated with the use of claims-based measures.

F.3.3. **If there are any fees associated with the use of this measure as specified, attach the fee schedule here.** *(Save file as: F3_3_FeeSchedule):*

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

U.1. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

U.1.1. **Current and Planned Use**
NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.
Current and Planned Use *(check all the current and planned uses; for any current uses that are checked, provide a URL for the specific program):*

Planned	*Current*	*For Current use, Provide URL*
Public Reporting		

U.1.2. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

N/A

U.1.3. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*):

This is a new measure and has only recently been finalized.

U.1.4. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** *(Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.):*
The measure has been finalized by CMS for use in the Hospital Inpatient Quality Reporting Program beginning in fiscal year 2016.

U.2 Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

U.2.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in IM.2.2 and IM.2.4. Discuss:
Progress (trends in performance results)
Geographic area and number and percentage of accountable entities and patients included:
N/A

U.2.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations:**
N/A

U.3. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

U.3.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them:**
We did not identify any unintended consequences during measure development and testing. We are committed to monitoring this measure's use and assessing potential unintended consequences over time, such as the inappropriate shifting of care or coding/billing practices, increased patient morbidity and mortality, and other negative unintended consequences for patients.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

H.1. Relation to Other NQF-endorsed® Measures

If there are related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population), list the NQF # and title of all related and/or competing measures.

H.1.1. **List of related or competing measures (selected from NQF-endorsed measures):**
0230 : Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following acute myocardial infarction (AMI) hospitalization for patients 18 and older.

H.1.2. **If related or competing measures are not NQF endorsed please indicate measure title and steward:**
N/A

H.2. Harmonization

The measure specifications are harmonized with related measures;

OR

The differences in specifications are justified

H.2.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
Yes

H.2.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden:**

H.3. Competing Measure(s)

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);

OR

Multiple measures are justified.

H.3.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures *(e.g., a more valid or efficient way to measure quality)***; OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.):**
N/A

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** Click here to enter NQF number

Measure Title: Hospital-level, risk-standardized payment associated with a 30-day episode-of-care for Acute Myocardial Infarction (AMI)

Date of Submission: 12/9/2013

Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☒ Cost/resource	☐ Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the subcriteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]
AND
If patient preference (e.g., informed decisionmaking) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors that influence the measured outcome (but not factors related to disparities in care or the quality of care) and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR

- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful** [16] **differences in performance**;

OR

there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias.

Notes

10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).

11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.

12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.

13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.

14. Risk factors that influence outcomes should not be specified as exclusions.

15. Risk models should not obscure disparities in care for populations by including factors that are associated with differences/inequalities in care, such as race, socioeconomic status, or gender (e.g., poorer treatment outcomes of African American men with prostate cancer or inequalities in treatment for CVD risk factors between men and women). It is preferable to stratify measures by race and socioeconomic status rather than to adjust out the differences.

16. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE

Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure*. *Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (*must be consistent with data sources entered in S.23*)	**Measure Tested with Data From:**
☐ abstracted from paper record	☐ abstracted from paper record
☒ administrative claims	☒ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☐ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☐ other: Click here to describe	☐ other: Click here to describe

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

The datasets/data sources used in testing included: Chronic Condition Data Warehouse (CCW), Medicare Enrollment Database (EDB), Medicare fee schedules, Federal Register Final Rules for Medicare PPS systems and payment policies, and CMS published wage index data. The dataset used varies by testing type; see Section S.5.1 for details

1.3. What are the dates of the data used in testing? Click here to enter date range

For development of the measure we used January 1, 2008 to January 31, 2009. After development of the measure we refined the measure and added another year of data (through January 31, 2010).

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: (*must be consistent with levels entered in item S.26*)	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other: Click here to describe	☐ other: Click here to describe

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

We calculated the Intraclass Correlation Coefficient (ICC) score in order to assess the reliability of the

measure. To calculate the ICC score we added an additional year of data (2009). We calculated the risk-standardized payment (RSP) using split-sample combined 2008-2009 data. The sample included 2,382 hospitals.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)
In model development and validation, we assessed the reliability of the patient-level risk-adjustment model by comparing model performance in a randomly selected 50 percent of the full-year 2008 sample (Sample A1) with its performance in the other 50 percent of the full-year 2008 sample (Sample A2). 90,281 admissions at 3,904 hospitals were included in the random 2008 Sample A1; and 90,281 admissions at 3,873 hospitals were included in the remaining 2008 Sample A2

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.
The datasets, dates, number of measured entities and number of admissions used in each type of testing are as follows:

For reliability testing (Section 2a2)
We assessed the reliability of the risk-adjustment model by comparing model performance in a randomly selected 50 percent of the full-year 2008 sample (Sample A1) with its performance in the other 50 percent of the full-year 2008 sample (Sample A2) and in the full-year 2008 sample (Sample A).

We assessed the reliability of the measure by calculating the ICC score using a split-sample of the combined 2008-2009 data.

For validity testing (Section 2b2)
Measure validity was demonstrated through chart-based validation on our other claims-based measures, through use of established measure development guidelines, and by systematic assessment of measure face validity by a Technical Expert Panel (TEP) of national experts and stakeholder organizations.

For testing of measure exclusions (Section 2b3)
In the development of the measure, we examined overall frequencies and proportions of the admissions excluded for each exclusion criteria for all AMI admissions in the 2008 CCW data. The total number of AMI admissions for 2008 was 284,301; the initial cohort after exclusions included 190,818 admissions; the final cohort, after randomly selecting one index hospitalization per patient, and excluding admissions for patients without an index admission DRG, included 180,562 admissions.

For testing of measure risk adjustment (Section 2b4)
During model development, we computed four summary statistics for assessing model performance using the development (A1 - random 50% sample of 2009) and validation (A2 - remaining 50% of 2009; A3 – full 2008 sample) cohorts:

(1) R-squared
(2) Over-fitting indices (Calibration $\gamma 0$, $\gamma 1$)

(3) Distribution of Standardized Pearson Residuals
(4) Predictive ratios

For testing to identify meaningful differences in performance (Section 2b5)
We identified the number of hospitals classified as higher than, no different than, and lower than the average national payment.

_____

2a2. RELIABILITY TESTING
***Note**: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*may be one or both levels*)
☒ **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)
☒ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)
Data Element Reliability
In constructing the AMI payment measure we aim to utilize only those data elements from the claims that have both face validity and reliability. We avoid the use of fields that are thought to be coded inconsistently across hospitals or providers. Additionally, CMS has in place several hospital auditing programs used to assess overall claims code accuracy, to ensure appropriate billing, and to recoup money from hospitals that were overpaid. CMS routinely conducts data analysis to identify potential problem areas and detect fraud, and audits important data fields used in our measures, including diagnosis and procedure codes and other elements that are consequential to payment.
Finally, we assessed the reliability of the data elements by comparing risk factor frequencies in the two randomly-selected samples (A1 and A2) as well as the full 2008 sample, and payment ratios (PRs) in the two randomly selected samples. We also added another year of data (2009) after the development of the measure and compared payment ratios for each risk factor in 2008, 2009 and 2008-2009 data.

Measure Score Reliability
We calculated the Intraclass Correlation Coefficient (ICC) score in order to assess the reliability of the measure. The ICC score can be used to determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)
Data Element Reliability

No notable differences were observed in risk factor frequencies or PRs across the samples.

Measure Score Reliability

As a metric of agreement we calculated the ICC (2,1) as defined by Shrout and Fleiss (1979).[1] To calculate the ICC score we added an additional year of data (2009). We calculated the risk-standardized payment (RSP) using split-sample combined 2008-2009 data. Thus, we obtained two RSPs for each hospital, using an entirely distinct set of patients from the same time period. To the extent that the calculated measures of these two subsets agree, we have evidence that the measure assesses an attribute of the hospital, not of the patients. The agreement between the two independent assessments of each hospital was 0.785, which, according to the conventional interpretation, is "substantial".[2]

References:

2. Landis J, Koch G. The measurement of observer agreement for categorical data. Biometrics. 1977;33:159-174.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)
The stability of the risk factor frequencies and payment ratios indicates data elements are reliable. Additionally, the ICC score demonstrates strong agreement across samples, indicating that the measure score is reliable.

_____

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☒ **Critical data elements** (*data element validity must address ALL critical data elements*)

☒ **Performance measure score**

- ☐ **Empirical validity testing**
- ☒ **Systematic assessment of face validity of <u>performance measure score</u> as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*
Measure validity is demonstrated through prior validity testing done on our other claims-based measures, through use of established measure development guidelines, and by systematic assessment of measure face validity by a Technical Expert Panel (TEP) of national experts and stakeholder organizations.

<u>Data Element Validity –Validity of Claims-Based Measures</u>
Our team has demonstrated for a number of prior measures the validity of claims-based measures for profiling hospitals by comparing either the measure results or individual data elements against medical records. CMS validated the six NQF-endorsed, claim-based measures currently in public reporting (AMI, heart failure, and pneumonia mortality and readmission) with models that used medical record-abstracted data for risk-adjustment. Specifically, claims model validation was conducted by building comparable models using abstracted medical record data for risk-adjustment for heart failure patients (National Heart Failure data), AMI patients (Cooperative Cardiovascular Project data) and pneumonia patients (National Pneumonia Project dataset). When both models were applied to the same patient

population, the hospital risk-standardized rates estimated using the claims-based risk-adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting. Our group has reported these findings in the peer-reviewed literature.[1-6]

Measure Score Validity-Validity Indicated by Established Measure Development Guidelines

We developed this measure in consultation with national guidelines for publicly reported outcomes measures, with outside experts, and with the public. The measure is consistent with the technical approach to outcomes measurement set forth in NQF guidance for outcomes measures[7] (National Quality Forum, 2010), CMS Measure Management System (MMS) guidance, and the guidance articulated in the American Heart Association scientific statement, "Standards for Statistical Models Used for Public Reporting of Health Outcomes".[8]

Measure Score Validity-Validity as Assessed by External Groups

Throughout measure development, we obtained expert and stakeholder input via three mechanisms: regular consultations with an expert health economist, a national TEP, and a 30-day public comment period in order to increase transparency and to gain broader input into the measure.

The health economist with whom we consulted had years of experience in economic analysis and working with claims data. We worked with the consultant to address key issues surrounding measure development, including detailed discussions regarding the appropriate cohort for inclusion in the measure. Having regular meetings with a consultant provided a forum for focused expert review and discussion of technical issues during measure development prior to consideration by the broader TEP.

In addition to consulting with a health economist, and in alignment with the CMS Measure Management System, we convened a TEP to provide input and feedback during measure development from a group of recognized experts in relevant fields. To convene the TEP, we released a public call for nominations and selected individuals who represent a range of perspectives including clinicians, consumers, and purchasers, as well as individuals with experience in quality improvement, performance measurement, and healthcare disparities. We convened two structured TEP conference calls consisting of presentation of key issues, our proposed approach, and relevant data, followed by open discussion among TEP members. We made modifications to the measure based on TEP feedback.

Following completion of the measure, we solicited public comment on the measure through CMS, and the public comments were posted publicly for 60 days.

Measure Score Validity-Face Validity as Determined by TEP

To systematically assess face validity, we surveyed the Technical Expert Panel and asked each member to rate the following statement using a six-point scale (1=Strongly Disagree, 2=Moderately Disagree, 3=Somewhat Disagree, 4=Somewhat Agree, 5= Moderately Agree, and 6=Strongly Agree): "This is a measure of payments for Medicare patients for a 30-day AMI episode of care. The measure removes policy adjustments that are independent of care decisions and risk-adjusts based on case mix. The measure is intended to provide CMS a tool to compare payments across hospitals nationally to identify hospitals that have notably higher or lower payments associated with AMI care. To what extent does the committee agree that this measure accomplishes this purpose?"

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)
Measure Score Validity-Validity as Assessed by External Groups
Among the 8 TEP members who responded to our face validity question, 3 moderately agreed and 5 strongly agreed that this measure accomplished the purposes of measuring payments for Medicare patients for a 30-day AMI episode of care, removing policy adjustments unrelated to care decisions, risk-adjusting based upon case mix, and providing CMS with a tool that it can use to compare payments across hospitals and identify hospitals with notably higher and lower payments.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
These results demonstrate TEP agreement with overall face validity of the measure score as specified. Measure validity is also ensured through the processes employed during development, including regular expert and clinical input, and modeling methodologies with demonstrated validity in claims-based measures.

_____

2b3. EXCLUSIONS ANALYSIS
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)
All exclusions (detailed in section S.10. "Denominator Exclusions") were determined by careful clinical review and were based on clinically relevant decisions.

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)
In the development of the measure, we examined overall frequencies and proportions of the admissions excluded for each exclusion criteria for all AMI admissions in the 2008 CCW data. The total number of AMI admissions for 2008 was 284,301; the initial cohort after exclusions included 190,818 admissions; the final cohort, after randomly selecting one index hospitalization per patient, and excluding admissions for patients without an index admission DRG, included 180,562 admissions. Categories are not mutually exclusive.

1. Age < 65 (11.4%)
2. Incomplete administrative data in the 12 months prior to the index hospitalization (13.0%)
3. Incomplete administrative data in the 30 days following the index admission (if alive) (6.7%)
4. Same or next day discharge and patient did not die or get transferred (3.8%)
5. Transfers into the hospital (6.8%)
6. Inconsistent or unknown mortality status (~0.0%)
7. Unreliable data (~0.0%)
8. Patients who leave hospital against medical advice (AMA) (0.6%)
9. Discharges from MD and US Territories hospitals (2.3%)
10. Transfers to Federal hospitals (0.1%)
11. Patients without an index admission DRG or DRG weight (~0.0%)

Since development of the measure we refined the cohort to include admissions for patients discharged from MD and US Territories hospitals, exclude patients enrolled in hospice in the 12months prior or on the day of the index admission, and exclude admissions which occur within 30 days of a previous index admission. We also modified the exclusions so that age over 65 and incomplete administrative data in the 12 months prior to the index hospitalization are now considered inclusion criteria. The results of the exclusions in the new cohort which include 350,930 index admissions in 2008-2009 are:

1. Incomplete administrative data in the 30 days following the index admission (if alive) (1.3%)
2. Same or next day discharge and patient did not die or get transferred (4.8%)
3. Transfers into the hospital (7.0%)
4. Inconsistent or unknown mortality status (~0.0%)
5. Unreliable data (~0.0%)
6. Patients who leave hospital against medical advice (AMA) (0.4%)
7. Hospice (0.9%)
8. Transfers to Federal hospitals (~0.0%)
9. Patients without an index admission DRG or DRG weight (0.1%)
10. Admissions within 30 days of a previous index admission (~0.0%)

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)
The first, fourth, fifth, eighth, ninth, and tenth exclusions are necessary for valid calculation of the measure; they affect very few patients. The second exclusion, same or next day discharges when the patient did not die or get transferred, prevents the inclusion of patients who likely did not suffer a clinically significant AMI. The third exclusion, patients transferring into a hospital, does not actually exclude acute episodes from the measure, but considers the hospital that initially admits the patient as the one accountable for the outcome, avoiding double counting and clarifying accountability. The sixth exclusion, patients discharged AMA, is based on clinical judgment to make the measure fair and is unlikely to distort the results given the very low frequency. The seventh exclusion, patients enrolled in hospice in the 12 months prior to or on the day of the index admission, is made in order to align the patients in the payment measure with those in CMS' 30-day AMI mortality measure.

_____

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?
☐ **No risk adjustment or stratification**
☒ **Statistical risk model with 32 risk factors**
☐ **Stratification by** Click here to enter number of categories **risk categories**
☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.
N/A

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care and not related to disparities*)
The goal of risk adjustment for this measure is to account for patient age and comorbid conditions that are clinically relevant and have strong relationships with the outcome while illuminating important payment differences between hospitals. The measure adjusts for case-mix differences based on the comorbidities of the patient at the time of index admission. Conditions that may represent adverse outcomes due to care received during the index admission are not considered for inclusion in risk adjustment. Although they may increase the risk of mortality and complications, including them as covariates in risk adjustment could attenuate the measure's ability to characterize payments influenced by care delivered by hospitals.

The candidate variables for the model are derived from secondary diagnoses of the index hospital stay (excluding potential complications), inpatient Part A data, outpatient hospital data, and Part B carrier files for physician, radiology, and laboratory services during the 12 months prior to the index hospital stay.

For candidate variable selection using the development sample (A1; random 50% of 2008 data), we started with the 189 Condition Categories (CCs). We used the ICD-9-to-CC assignment map, which is maintained by CMS and posted at www.qualitynet.org. To select candidate variables, a team of clinicians reviewed all 189 CCs and excluded those that were not relevant to the Medicare population or that were not clinically relevant to the AMI payment outcome (e.g., attention deficit disorder, female infertility). Clinically relevant CCs were selected as candidate variables; some of these CCs were combined into clinically coherent groups. Other adjustment variables included age, history of PCI, and history of CABG.

To inform variable selection, we performed a modified approach to stepwise generalized linear model regression. We used sample A1 to create 1,000 bootstrap samples. For each sample, we ran a generalized linear model that included all candidate variables. The results were summarized to show the percentage of times that each of the candidate variables was significantly associated with AMI payment (at the $p<0.05$ level) in the 1,000 bootstrap samples (e.g., 70% would mean that the candidate variable was significant at $p<0.05$ in 70% of the bootstrap

The working group reviewed these results and decided to retain all risk-adjustment variables above a 90% cutoff (i.e., to retain variables that were significant at the $p<0.05$ level in at least 90% of the bootstrap samples). We chose the 90% cutoff because variables above this threshold demonstrated a relatively strong association with AMI payment and were clinically relevant.

2b4.4. What were the statistical results of the analyses used to select risk factors?

CC	DESCRIPTION	PCT P<.05

Dialysis Status (CC 130)
Internal Injuries (CC 160)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Risk-Adjustment Model Development and Validation in Medicare FFS

As is typical with data for healthcare payments, our dependent variable – total payment for an AMI 30-day episode of care – was both right-skewed and leptokurtotic (skewness= 2.7; kurtosis = 15.4). To address estimation problems that can arise with non-normally distributed data, we employed the algorithm suggested by Manning & Mullahy.[1] Using this algorithm and Sample A (full 2008 sample), we compared several alternative models in order to determine the best estimation approach. Based on these assessments, we chose to estimate a generalized linear model with a log link and an inverse Gaussian distribution.

Approach to Assessing Model Performance

During model development, we computed four summary statistics for assessing model performance using the development (A1; random 50% sample of 2008) and validation (A2; remaining 50% of 2008) cohorts:

(1) R-squared
(2) Over-fitting indices (Calibration γ0, γ1)
(3) Distribution of Standardized Pearson Residuals
(4) Predictive ratios

Top 1%:	A1 0.96; A2 0.93

2b4.9. Results of Risk Stratification Analysis:
N/A

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i*.e., what do the results mean and what are the norms for the test conducted*)
R2
For a traditional linear model (i.e. ordinary least squares regression) R2 is interpreted as the amount of variation in the observed outcome that is explained by the predictor variables (patient-level risk factors). Generalized linear models (GLMs), however, do not output an R2 that is akin to the R2 of a traditional linear model. In order to provide the NQF Committee with a statistic that is conceptually similar, we produced a "quasi-R2" by regressing the total payment outcome on the predicted outcome. [1] Specifically, we regressed the total payment on the payment predicted by the patient-level risk factors. This regression produced a quasi-R2 of 0.050, suggesting that approximately five percent of the variation in payment can be explained by patient-level risk factors. This quasi-R2 is in-line with R2s from other patient-level risk-adjustment models for health care payment.[2]

Over-fitting (Calibration γ0, γ1)
Over-fitting can result in the phenomenon in which a model describes the relationship between predictor variables and the outcome well in the development sample, but fails to provide valid predictions in new patients. If the γ0 in the validation samples are substantially far from zero and the γ1 is substantially far from one, there is potential evidence of over-fitting.

Standardized Pearson Residuals

Standardized Pearson residuals also assess model fit. If a substantial number of standardized Pearson residuals exceed 2 in absolute value, lack of fit may be indicated.

Predictive Ratios

A predictive ratio is an estimator's ratio of predicted outcome to observed outcome.[1] A predictive ratio close to 1.0 indicates an accurate prediction. A ratio substantially greater than 1.0 indicates overprediction, and a ratio substantially less than 1.0 indicates underprediction.

Overall Interpretation

Interpreted together, our diagnostic results demonstrate the risk-adjustment model adequately controls for differences in patient characteristics (case mix).

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

N/A

_____

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE

2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

Consistent with the other publicly reported measures, AMI, heart failure, and pneumonia mortality and readmission, we will calculate interval estimates for the risk-standardized payment to characterize the amount of uncertainty associated with the payment, compare the interval estimate to the average national payment, and categorizes hospitals as "higher than," "less than," or "no different than" the average national payment. See Section 2.8.2 of the attached Technical Report for description of analytic method.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

Both unadjusted and adjusted payments from AMI admission to 30 days post-admission vary considerably across hospitals. For hospitals with at least 25 cases, the hospital unadjusted AMI 30-day episode-of-care payment ranges from $12,282 to $37,482 across 1,846 hospitals with a median (interquartile range) of $19,683 ($17,880, $21,585). The mean ± SD hospital unadjusted payment is $19,799 ± $2,829. After adjusting for patient and clinical characteristics, the risk-standardized payment at the hospital-level has a mean ± SD of $20,207 ± $1,478, ranging from $15,251 to $27,317 across 1,846 hospitals. The median (interquartile range) risk-standardized hospital payment rate is $20,152 ($19,191, $21,211).

CMS also conducted a dry run of the measure in August/September 2013. As part of the dry run we calculated the number of hospitals identified as higher than, no different, and lower than the average national payment. Of the 2,382 hospitals in the measure, 169 where classified as lower than the national average payment and 361 were classified as higher than the national average payment.

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i*.e., what do the results mean in terms of statistical and meaningful differences?*)
The variation in rates suggests that there are meaningful differences across hospitals in risk-standardized payments associated with a 30-day episode of care for patients with AMI.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS
If only one set of specifications, this section can be skipped.

Note*: This criterion is directed to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***If comparability is not demonstrated, the different specifications should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to demonstrate comparability of performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)
N/A

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)
N/A

2b6.3. What is your interpretation of the results in terms of demonstrating comparability of performance measure scores for the same entities across the different data sources/specifications? (i*.e., what do the results mean and what are the norms for the test conducted*)
N/A

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)
N/A

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

N/A

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

EXECUTIVE SUMMARY

This technical report describes the hospital-level, risk-standardized 30-day episode-of-care payment measure for acute myocardial infarction (AMI) developed by Yale New Haven Health Services Corporation – Center for Outcomes Research & Evaluation (YNHHSC/CORE) under contract with the Centers for Medicare & Medicaid Services (CMS). A risk-standardized payment measure for an AMI episode of care that spans from admission through 30 days post-admission provides information that will support hospital efforts to optimize and coordinate care.

Context of Medicare Spending and Value Assessments

Medicare spending is estimated to have been $525.0 billion in 2010 with annual growth rates projected to be 6.3% for 2013 through 2020. This growth in spending is unsustainable and highlights the need to understand the value of care Medicare buys with every dollar spent. High-value care can be illuminated by assessing hospitals on both cost and quality measures. In this report, we describe the development of a "cost" measure that evaluates the cost of care for Medicare patients from the CMS perspective. We developed this measure to align with current quality of care measures to facilitate the profiling of hospital value.

Using Payments for Medicare Patients

Costs are often approximated using hospital charges, converting hospital charges to costs based on cost-to-charge ratios, or estimated based on Medicare payments. Because we are interested in measuring costs from Medicare's perspective, we focused on payments made for Medicare patients for a 30-day episode of care for AMI. Payments for Medicare patients are calculated from a combination of Medicare claims and CMS data. Using CMS's clearly defined Prospective Payment Systems and Fee Schedules in combination with Medicare claims allows for the removal of payment adjustments that are not directly related to care (e.g., geographic factors and policy adjustments) across all care settings, services, and supplies.

Measuring AMI

By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care. AMI is a common condition in the elderly with substantial variability in payments due to different practice patterns. Quality measures for AMI such as 30-day AMI risk-standardized mortality (RSMR) are already publicly reported. In the context of its publicly reported quality measures, AMI is an ideal condition in which to assess payments for Medicare patients and relative hospital value.

30-Day Episode of Care

When considering hospital payments, we focused on an "episode of care" triggered by admission for several key reasons. First, hospitalizations represent brief periods of illness that require ongoing management post-discharge. Second, decisions made at the admitting hospital affect payments for care in the immediate post-discharge period. Third, attributing payments for a continuous episode of care to admitting hospitals may reveal practice variations in the full care of the illness that can result in increased payments**.** Fourth, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, we designed the AMI payment measure to be aligned with AMI quality measures, i.e. CMS's publicly reported AMI mortality measure, which is reported 30 days after admission. The AMI payment measure captures payments for Medicare patients across multiple care settings, services, and supplies (i.e., inpatient, outpatient, skilled nursing facility, home health, hospice,

physician/clinical laboratory/ambulance services, and durable medical equipment, prosthetics/orthotics, and supplies).

Payment Calculation

The overarching goal of the measure is to calculate payments that reflect differences in the care provided for patients with AMI rather than differences based on geography or policy adjustments. In order to remove payment adjustments unrelated to clinical care we developed the measure by "stripping" or "standardizing" payments as detailed below:

- Stripping refers to removing geographic differences and policy adjustments in payment rates for individual services.
- Standardizing refers to averaging payments across geographic areas for those services where geographic differences in payment cannot be stripped.

By removing payment adjustments unrelated to clinical care, our measure reflects differences in payment due to practice variation at the hospital level. The body of the report presents the current measure specifications, methodology, and results in detail. Although the methodology of this payment measure is developed for AMI, it can be applied to other disease conditions such as heart failure and pneumonia.

Statistical Model

To calculate hospital-specific risk-standardized payments, we estimated hierarchical generalized linear models. This strategy accounts for within-hospital correlation of the observed outcomes and accommodates the assumption that underlying differences in quality across hospitals lead to systematic differences in outcomes.

Findings

Wide variation in payments for an AMI episode of care persists after considering transfers, removing Medicare payment adjustments that are not related to clinical care (e.g., geographic factors and policy adjustments), and adjusting for case mix.

1. INTRODUCTION

1.1. Background

Medicare spending is estimated to have been $525.0 billion in 2010 with annual growth rates projected to be 6.3% for 2013 through 2020 due to both an increase in the Medicare population as well as Medicare spending on each beneficiary.[1] Further projections anticipate an exhaustion of Medicare's Hospital Insurance Trust Fund (Part A) by 2024.[2] The growth in spending is unsustainable and highlights the need to understand the value of care Medicare buys with every dollar spent.

Given the urgency of the Medicare Hospital Insurance Trust Fund and the fact that Medicare pays for 40-50% of hospitalizations nationally,[3] hospital costs are a natural venue in which to deconstruct payments for Medicare patients. Yet payments to hospitals are difficult to interpret in isolation. Some high-payment hospitals may have better clinical outcomes when compared with low-payment hospitals; other-high payment hospitals may not. For this reason, the value of hospital care is more clearly assessed when pairing hospital payments with hospital quality.

A measure of payments for Medicare patients to hospitals that is aligned with current quality of care measures will facilitate profiling hospital value (payments and quality). Under contract with CMS, we developed a measure of payments for Medicare patients that reflects differences in the management of care for patients with AMI both during hospitalization and immediately post-discharge. AMI is a condition with substantial variation in costs of care and for which there are well-established publicly reported quality measures, and is therefore an ideal condition for assessing relative value for an episode of care that begins with an acute hospitalization. By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care.

Understanding both inpatient and post-discharge costs will become increasingly important with the push toward Accountable Care Organizations (ACOs).[4] These ACOs are intended to create financial incentives for providers to work together to treat an individual patient across care settings, including in doctor's offices, hospitals, and long-term care facilities. The Medicare Shared Savings Program will reward ACOs that lower growth in health care costs while meeting quality metrics. Participation in ACOs is currently voluntary, but the growing interest in ACOs emphasizes the importance of characterizing the association between quality of care and payments for Medicare patients for an episode of care triggered by hospitalization.

1.2. Assessing Cost of Care by Measuring Payments for Medicare Patients

There are many different ways to measure cost including, but not limited to, approximations using hospital charges, conversions of charges to costs using cost-to-charge ratios, and estimations based on Medicare payments.

Hospital charges are the prices a hospital sets for its services. Hospital costs – the fixed and variable expenses incurred by the hospital in providing the services – are just one of many factors that influence the amount a hospital charges for services. Other factors may include: input prices, target profit margins, competition, and the necessity of recouping the costs of uncompensated care. Hospital charges often do not accurately reflect true costs of care.

Cost-to-charge ratios help translate hospital charges into cost. Cost-to-charge ratios are defined as a hospital's total expenses divided by the sum of the hospital's gross patient revenue and other operating revenue. In order to apply a hospital's cost-to-charge ratio, researchers must use the Medicare hospital cost reports in combination with Medicare claims data. Inherent in this process are problems with the data, which are magnified when trying to use more than one data source. Specifically, cost centers identified in the cost reports may not match revenue centers in the claims files, making the payment calculation via this method impossible for some hospitals.[5]

Payments for Medicare patients are generated from a combination of Medicare claims and CMS data. Using CMS's clearly defined Prospective Payment Systems and Fee Schedules in combination with Medicare claims, allows for the removal of payment adjustments that are not directly related to care (e.g., geographic factors and policy adjustments) across all care settings, services, and supplies. **For this task, we have defined the "cost" of care as payments made for Medicare patients for an AMI episode of care.**

1.3. Measuring AMI Payments

By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care. AMI is a common condition in the elderly with a substantial range in payments due to different practice patterns. Furthermore, because 30-day all-cause mortality and readmission measures for AMI are already publicly reported, AMI serves as a model condition for examining the association of payments for an episode of care with the quality of a hospital's care.

Additionally, AMI is clinically complex, commonly requiring the coordination of care between two or more hospitals for the acute admission. These transfer scenarios may be less important in other disease processes, but require the consideration of Medicare's transfer payment policies for the development of this payment measure. Thus, applying this methodology to other clinical conditions could be facilitated by beginning with AMI.

1.4. Episode of Care

When considering payments to hospitals, we focused on a 30-day "episode of care" triggered by admission for several key reasons. First, hospitalizations represent a brief period of acute illness that requires ongoing management post-discharge. Second, decisions made at the admitting hospital affect not only the hospitalization payments, but payments for care in the immediate post-discharge period. Third, assessing payments for a continuous episode of care may reveal practice variations in the full care of the illness that triggered admission. For instance, lower inpatient payments may be counterbalanced by greater dependence on post-acute care, such as skilled nursing, in some regions. Such patterns would not be visible in an inpatient-only measure. Fourth, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, when pairing payments with quality, measures should be aligned as much as possible. Most publicly reported quality measures are reported for a 30-day period after admission or discharge (e.g. RSMR rate and risk-standardized readmission rate).

Using the Chronic Condition Warehouse (CCW) data, we can track payments for Medicare patients through the post-discharge period. The CCW data are derived from Medicare claims in the Standard Analytic Files and contain payments for all care settings, services, and supplies. The CCW data provide a unique opportunity to gain insight into a cascade of medical events triggered by AMI hospitalization and the payments associated with those events. The specific goal of this task is to sum payments for Medicare patients, including index admission as well as post-discharge payments, for: readmission or other post-discharge inpatient care, skilled nursing facilities, outpatient providers, home health agencies, hospice care, physician/clinical laboratory/ambulance services, and durable medical equipment, prosthetics/orthotics, and supplies. This work will be used to better understand differences in the patterns of post-discharge care and associated payments made for Medicare patients across a continuum of care beginning with a hospitalization for AMI and following patients 30 days after hospital admission.

Please note that for easy reference, we sometimes refer to the hospital-level, risk-standardized payment measure for a 30-day episode of care for AMI simply as the AMI payment measure in this document.

1.5. Approach to Measure Development

We developed this measure in accordance with national guidelines and in consultation with clinical and measurement experts, key stakeholders, and the public. The proposed measure is consistent with the technical approach to outcomes measurement set forth in the National Quality Forum (NQF) guidance for outcomes measures,[6] CMS's Measure Management System (MMS),[7] and the guidance articulated in the American Heart Association's scientific statements, "Standards for Statistical Models Used for Public Reporting of Health Outcomes"[8] and "Standards for Measures Used for Public Reporting of Efficiency in Health Care."[9] During the measure development process, we obtained expert and stakeholder input via two mechanisms: first, through regular discussions with an advisory working group, and second, through meetings with a national Technical Expert Panel (TEP).

We held regular conference calls with our working group throughout the measure development phase. The working group included clinicians and other professionals with expertise in cardiology, biostatistics, health economics, measure development, and quality improvement. The working group meetings addressed key issues surrounding measure development, including detailed discussions regarding specific decisions (e.g., defining the appropriate measure cohort) to ensure the methodological rigor of the measure.

In addition to the working group and in alignment with the CMS's MMS, we convened a TEP consisting of a group of recognized experts and stakeholders in relevant fields to provide input and feedback during measure development. To form the TEP, we posted a public call for nominations and selected individuals representing a range of perspectives including those of physicians, health economists, consumers, hospitals, and purchasers. In contrast to the working group meetings, the TEP meetings followed a more structured format consisting of the presentation of key issues, relevant data, and our proposed approach. This presentation was followed by open discussion of these issues with TEP members.

We posted the measure specifications and a summary of the TEP discussions publicly, after which we underwent a 30-day public comment period. We collected these comments through the MMS website

and summarized them for CMS. We also posted the comments verbatim on the MMS website. We considered all submitted comments during the final stages of measure development.

1.6. Aims of the Measure

The primary objective of this work is to develop a 30-day episode-of-care AMI payment measure that:

1. captures differences in the care provided by hospitals for patients with an AMI,
2. accounts for differences in the care coordinated by hospitals immediately post-discharge,
3. removes variation in payments due to payment adjustments that are not directly related to clinical care (e.g., geography and policy adjustments),
4. adjusts for hospital case-mix,
5. assesses relative performance of hospitals, and
6. aligns with AMI quality measures.

Using administrative claims data, we measure risk-standardized payments for Medicare patients for an episode of care that begins with an index admission for AMI and ends 30 days after the index admission. The AMI payment measure captures payments for Medicare patients across multiple care settings, services, and supplies (i.e., inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, and durable medical equipment, prosthetics/orthotics, and supplies). We remove payment adjustments unrelated to clinical care decisions. By risk-standardizing the payment measure, we are able to adjust for the case mix at any given hospital and compare a specific hospital's AMI payment to an average hospital with a similar case mix. Key decisions in the development of the AMI payment measure are aligned with key decisions in CMS's 30-day AMI RSMR measure.

Our methodology is developed in accordance with accepted standards for outcomes measure development, including appropriate risk adjustment to allow for fair profiling of institutions and transparency of specifications.

2. METHODS

2.1. Overview of Measure Methodology

We developed a hospital-level, risk-standardized payment measure for a 30-day episode of care for AMI. The measure comprises a single summary payment and uses index admissions from one year of CCW data (2008) to assess hospital performance. This measure is intended to capture differences in payment for a 30-day episode of care for AMI at the hospital level. Payments for Medicare patients can vary for a number of reasons, including:

1. hospital practice patterns,
2. payment adjustments that reflect geography (e.g., paying different amounts for the same service in different parts of the country),
3. payment adjustments that reflect policies (e.g., indirect medical education and disproportionate share adjustments) that serve a broader mission of CMS, but do not reflect medical care, and
4. case mix.

To isolate payment variation that reflects practice patterns rather than CMS payment adjustments, we "strip" or "standardize" payments for each care setting. Stripping refers to removing geographic differences and policy adjustments in payment rates for individual services from the total payment for that service. Standardizing refers to averaging payments across geographic areas for those services where geographic differences in payment cannot be stripped. Stripping and standardizing the payment amounts allows for a fair comparison across hospitals based solely on payments for decisions related to clinical care of AMI.

We adjust for case mix differences across hospitals by risk adjusting for patients' comorbid conditions identified in claims for acute inpatient hospital stays, hospital outpatient care, and physician, radiology, and laboratory services for the 12 months prior to the index admission as well as select conditions indicated by secondary diagnoses codes on index admission. We do not risk adjust for diagnoses that may be complications of care during the index admission (Appendix A). We used CMS Condition Category groups (CCs) to define the comorbid risk adjustment variables. Additionally, we risk adjust for the patients' age and a history of percutaneous coronary intervention (PCI) and/or coronary artery bypass graft surgery (CABG).

We use generalized linear modeling to estimate the risk adjustment model and validate the model via a split sample process. We then use hierarchical generalized linear regression to isolate a hospital-specific payment signal and to account for the clustering of admissions within each hospital. Finally, we calculate predicted and expected payments (as defined in Section 2.8) for each hospital.

Following initial measure development we made minor changes to the measure cohort and evaluated measure results in both 2008 and 2009. These updates and results are provided in Appendix C.

2.2. Dataset

The CCW data are derived from the Medicare claims in the Standard Analytic Files. The CCW data contain data from the Medicare fee-for-service (FFS) institutional and non-institutional claims, enrollment and eligibility information, and assessment data for up to 100% of the Medicare beneficiary

population for particular conditions. The data are organized by predefined chronic conditions including AMI, but can also be used to define individualized patient cohorts as described below. The annual CCW datasets include claims data from all seven standard files (inpatient, skilled nursing facility, outpatient, home health agency, hospice, carrier, and durable medical equipment) that can be linked across care settings, services, supplies, and years using a unique patient identifier. Specific information available in the CCW data includes diagnosis codes, procedure codes, quantity/units of services used, and payments made by CMS, patients, and other insurers to care providers. We describe our methodology for estimating payments for an AMI episode of care below.

2.3. Cohort

Although the CCW data make a pre-defined cohort of AMI available, **we created our own AMI cohort from the CCW 2008 100% sample to be aligned with CMS's publicly reported 30-day AMI mortality measure**. Consistent with the AMI mortality measure, we included hospitalizations with a principal discharge diagnosis of AMI as classified by the International Classification of Diseases, Ninth revision, Clinical Modification (ICD-9-CM) code 410.xx, excluding those with 410.x2 (AMI, subsequent episode of care). A full list of ICD-9-CM codes included in our final cohort can be found in Appendix B. An **index hospitalization** is the initial AMI admission that triggers the 30-day episode of care for this payment measure. We included only those hospitalizations in 2008 from short-stay acute care hospitals in the index cohort. We restricted the cohort to patients enrolled in FFS Medicare Parts A and B (with no Medicare Advantage coverage).

If a patient had more than one eligible index AMI admission in 2008, we randomly selected one AMI admission for three reasons. First, repeated AMI hospitalizations for the same patient are not independent events. Including all AMI admissions from the same patient would introduce additional clustering of data within patients which can further complicate the analytic model. Second, because treatment patterns may differ when caring for a patient with a subsequent AMI, particularly if the event occurred within months of a "first" AMI, payments for repeated AMI admissions may not be as costly. The alternative approach of selecting only the "first" AMI admission could overestimate payments, while selecting only the subsequent AMI admission(s) may underestimate payments. Third, this strategy is consistent with CMS's publicly reported AMI 30-day mortality measure.

When using more than one year of data, we do not consider AMI admissions within 30 days of an index AMI admission as a new "index" admission. This situation arises when a patient has two or more qualifying index admissions within 30 days of the end of one calendar year and the beginning of the next (i.e., a patient is admitted for AMI on both December 15, 2008 and January 5, 2009). In this situation, the first admission is considered the index admission and payments for additional AMI admissions falling within 30 days of the index admission are captured as part of the first admission's episode of care.

Consistent with CMS's publicly reported AMI 30-day mortality measure, we consider admissions with transfers as a single inpatient hospitalization. To confirm the diagnosis, patients with AMI who transferred from one facility to another are required to have a principal discharge diagnosis of AMI at both hospitals. We do not include transfers directly from the emergency department (ED) to a second hospital in our transfer scenario because the CMS payment structure does not classify ED care as an admission. In these cases, the episode of care begins with an inpatient admission at the receiving hospital.

2.3.1. Index Cohort Exclusions

We applied several exclusion criteria to the cohort of index admissions as delineated below and in Figure 1:

- Admissions for patients with fewer than 30 days of post-admission enrollment in FFS Medicare Parts A and B
  Rationale**:** This is necessary in order to identify the outcome (payments) in the sample over our analytic period.

- Admissions for AMI patients who were admitted and discharged on the same- or next-day (and did not die or get transferred)
  Rationale**:** These patients likely did not suffer a clinically significant AMI.

- Admissions for patients transferred into the hospital
  Rationale: The acute episode is included in the measure but episode-of-care payments are assigned to the hospital where the patient was initially admitted rather than the hospital receiving the transferred patient.

- Admissions with inconsistent or unknown patient vital status
  Rationale: We exclude stays for patients that include inconsistent data (e.g., date of death precedes date of admission).

- Admissions with unreliable data
  Rationale: We exclude stays for patients that include unreliable data (e.g., age is greater than 115 or gender is discordant on the index admission claim and the denominator file).

- Admissions where patients are discharged against medical advice
  Rationale**:** Hospitals had limited opportunity to implement high quality care.

- Discharges from Maryland and U.S. Territories Hospitals
  Rationale: These hospitals are not paid under the Inpatient Prospective Payment System (IPPS).

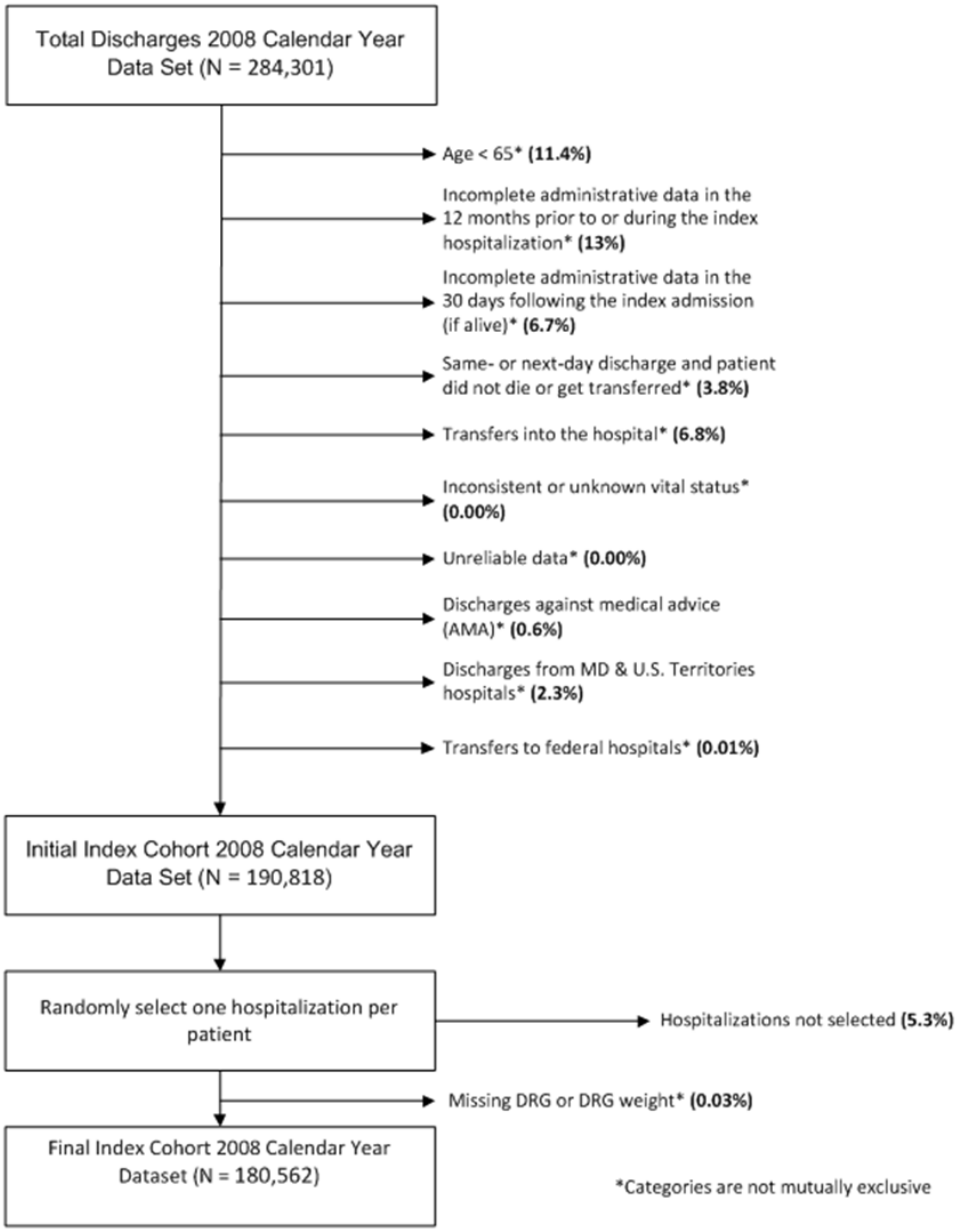
- Patients transferred to federal hospitals
  Rationale**:** We do not have claims data for these hospitals; therefore, including these patients would systematically underestimate payments.

- Admissions without a diagnosis-related group (DRG) or DRG weight for the index hospitalization
  Rationale: We cannot calculate a payment for these patients' index admission using the (IPPS). Lack of payment estimates for these hospitalizations would result in underestimated payments for the entire episode of care.

Subsequent to the original measure development the methodology was updated to include AMI admissions from hospitals in Maryland and US Territories and exclude patients with hospice

enrollment within one year prior to or on the date of the index admission. These updates are detailed in Appendix C.

Figure 1. Index AMI Cohort for the 2008 Calendar Year Sample



2.4. Outcome

The primary outcome of this measure is the hospital-level, risk-standardized payment for an AMI episode of care. The AMI payment measure captures payments for Medicare patients across multiple care settings, services, and supplies (i.e. inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, and durable medical equipment, prosthetics/orthotics, and supplies). We remove payment adjustments unrelated to clinical care decisions. By risk standardizing the payment measure, we are able to adjust for case mix at any given hospital and compare a specific hospital's AMI payment to an average hospital with a similar case mix. We define our analytic timeframe as beginning with the index admission for AMI to 30 days post-admission.

2.4.1. 30-day Timeframe

We considered 30 days post-admission as a clinically reasonable time frame for multiple reasons:

a. Within a 30-day time frame, payments are more likely attributable to care received during the index hospitalization and during the transition to the post-discharge setting.
b. The 30-day preset window provides a standard observation period by which to compare all hospitals.
c. The 30-day post-admission time frame is consistent with the other CMS measures endorsed by the NQF and publicly reported by CMS, including CMS's 30-day AMI mortality measure. We designed the AMI payment measure to align with CMS's publicly reported AMI mortality measure to facilitate assessments of health care value.

2.4.2. Prorating Payments

Some claims overlap the beginning or end date of the analytic timeframe. If a claim for payment began prior to the index admission, but ended in the analytic timeframe, it was excluded from our calculation. If a claim for payment began within the analytic timeframe, but ended after the last date of our 30-day post-admission period, we prorated the payment for the claim over the days in the analytic timeframe (Appendix D. Example of Included and Excluded Payments for a Patient Admitted on May 3 and Discharged on May 8).

2.4.3. Transfer Scenarios

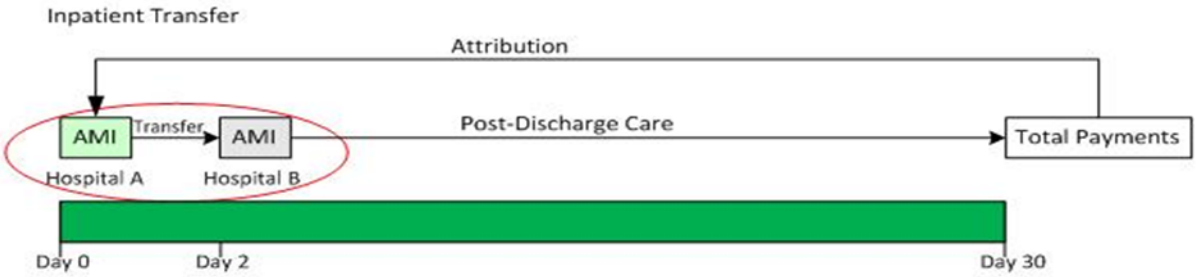
Because acute-to-acute hospital transfers are common among Medicare FFS beneficiaries age 65 or older hospitalized with AMI (8% of all index hospitalizations in internal analyses from 2008, data not shown), we included hospitalizations involving transfers in our payment calculation.

Medicare reduces payments when patients are transferred to another IPPS hospital and have a length of stay at least one day less than the geometric mean length of stay for the DRG. Under this policy, transferring hospitals are paid a per diem rate. For stays at the transferring hospital that are equal to or greater than the geometric mean length of stay for the DRG, transferring hospitals receive a full DRG payment.[10] We assign the per diem rate or the full DRG rate to the

transferring hospital where applicable and then add it to the payment for the hospital that received the transfer patient to calculate the payment for the index admission. We then aggregate total patient-level payments for each post-discharge care setting over the defined time period.

Because the episode of care begins at the time of index admission, we attribute this combined inpatient payment along with any payments made for post-discharge care to the transferring hospital Figure 2. This approach aligns with CMS's publicly reported measure for AMI RSMR.

Figure 2. Episode of Care for Transfer Patient



2.4.4. Removing Payment Adjustments

The overarching goal of the measure is to calculate payments that reflect differences in the care provided for patients with AMI rather than differences in payments based on geography (e.g., cost of living and wage index) or policy adjustments (e.g., indirect medical education and disproportionate share). Because these payment adjustments do not reflect the care delivered by hospitals, we remove geography and policy adjustments when calculating payments for each care setting, service, and supply by stripping or standardizing as described below.

2.5. Calculating Payments for Different Care Settings, Services, and Supplies

Medicare pays for health care services using a number of different payment systems that are generally organized by delivery setting (Appendix E). These payment systems consider not only the products the Medicare patient is buying in each setting, but also the characteristics of the care provider, the extent to which the same product may be furnished in different settings, and the market circumstances that affect providers' costs. Payment amounts within each payment system are usually updated annually (e.g., the IPPS) with some fee schedules having quarterly updates (e.g., Durable Medical Equipment/Prosthetics and Orthotics [DME/POS]). Information on CMS reimbursement rates for each care setting are made publicly available through either final rules published in the Federal Register, or fee schedules provided on the CMS website. A summary of Medicare's reimbursement system for most care settings is publicly available at the Medicare Payment Advisory Committee (MedPAC) website.[10] Below, we describe the key features of these payment systems and how we use these CMS payment algorithms to determine an episode-of-care payment for AMI that isolates clinical care decisions. Appendix E provides payment diagrams for all care settings along with our approach to stripping or standardizing payments.

2.5.1. Inpatient Care Settings

2.5.1.1. Acute Inpatient Hospitals

Medicare beneficiaries sometimes require hospitalization for an acute illness.

How Medicare Reimburses Acute Inpatient Hospitals

Medicare pays most acute inpatient hospitals through a prospective payment system (PPS). This system uses DRG-specific weights to calculate a payment above or below the fixed payment, known as the base payment rate (operating and capital), which reflects the cost (labor and non-labor) to deliver care to a patient for an average Medicare hospitalization. The DRG payment covers routine operating costs attributable to patient care, including nursing services, room and board, and diagnostic and ancillary services. In addition to the primary discharge diagnosis, DRGs account for up to eight secondary diagnoses and up to six procedures (e.g. percutaneous cardiovascular procedure with or without intervention or coronary artery bypass grafting) performed during the stay. Other factors that inform DRG assignment are age, gender, and discharge destination. CMS assigns a unique weight to each DRG indicating the relative costliness of inpatient treatment for patients in a given DRG. Conditions that involve greater resource utilization (usually associated with procedures, comorbidities, or complications) are assigned higher DRG weights.

Table 1 demonstrates the calculation of payments for the most frequent DRGs in our 2008 cohort. These DRGs are ordered by the amount of the DRG payment made to hospitals rather than by the frequency in our cohort.

Table 1. Most Frequent DRGs in AMI Patients in 2008

DRG	MS-DRG Title	Surgical	DRG Weight	Payment*	% of Index Admissions
233	Coronary bypass w cardiac cath w MCC	Yes	6.4496	$34,935.81	3%
234	Coronary bypass w cardiac cath w/o MCC	Yes	4.9216	$26,659.03	3%
246	Perc cardiovasc proc w drug-eluting stent w MCC or 4+ vessels/stents	Yes	2.9046	$15,733.46	4%
248	Perc cardiovasc proc w non-drug-eluting stent w MCC or 4+ ves/stents	Yes	2.5180	$13,639.35	4%
247	Perc cardiovasc proc w drug-eluting stent w/o MCC	Yes	2.1255	$11,513.28	11%
249	Perc cardiovasc proc w non-drug-eluting stent w/o MCC	Yes	1.8124	$9,817.30	8%
280	Acute myocardial infarction, discharged alive w MCC	No	1.7391	$9,420.25	25%
283	Acute myocardial infarction, expired w MCC	No	1.5787	$8,551.41	6%
281	Acute myocardial infarction, discharged alive w CC	No	1.3126	$7,110.01	15%
282	Acute myocardial infarction, discharged alive w/o CC/MCC	No	1.0617	$5,750.95	9%

* This amount is arrived at by multiplying the FY 2008 operating and capital base payment amounts by the DRG weight

Medicare makes a number of payment adjustments which affect the total payment for an inpatient stay. Three major categories of adjustments include geography, policy, and

outlier payments. Medicare adjusts for differences across hospitals in cost of living (geographic factor) and labor costs (wage index). Policy adjustments can result in additional payments to reflect the cost of teaching medical trainees (indirect medical education) and providing care to low-income patients (disproportionate share). Finally, Medicare makes "outlier payments" for admissions when the hospital's gross costs exceed a threshold amount that includes the DRG rate plus the amount payable for indirect medical education, disproportionate share payments, and a fixed dollar amount set annually by CMS. Outlier payments are not automatic: a hospital must make a specific request and must identify the actual cost associated with each outlier case.

Approach to Stripping Payments

In our calculation of payments for the index AMI hospitalization, we omit geographic factors and policy adjustments. We first multiply the operating and capital base payment rates by the DRG weight for each claim to arrive at our stripped payment. Medicare reduces payments when patients are transferred to another IPPS hospital and have a length of stay at least one day less than the geometric mean length of stay for the DRG. Under this policy, transferring hospitals are paid either a per diem rate or, for stays that are equal or greater than the geometric mean length of stay for the DRG, a full DRG payment. When applicable, we include this rule in our payment calculation. We then add any applicable outlier payments (after removing any wage index adjustment) that hospitals receive for unusually high-cost claims where applicable.

2.5.1.2. Inpatient Psychiatric Facilities (IPFs)

Medicare beneficiaries sometimes require hospitalization for an acute psychiatric illness.

How Medicare Reimburses IPFs

Medicare pays IPFs through a PPS. Under the IPF PPS, Federal per diem base rates are adjusted for geographic factors, patient characteristics (psychiatric DRG, age, comorbidities, length of stay), and facility characteristics (urban/rural, indirect medical education). Additional payments are made to IPFs based on the presence of a qualifying emergency department, the number of electroconvulsive therapy (ECT) treatments furnished, and outlier payments for cases with very high costs.

Approach to Stripping Payments

We multiply the base payment by adjustments for the patients' psychiatric DRG, age, and comorbidities and omit any adjustments for wage index, cost of living, or facility characteristics. We then account for length of stay and any ECT treatments to arrive at our stripped payment. We add outlier payments but remove the wage index adjustment for these payments where applicable. For model development, we did not adjust for the presence of a qualifying emergency department because we did not have access to

those data; however, this adjustment will be made when the measure incorporates additional years of data.

2.5.1.3. Inpatient Rehabilitation Facilities (IRFs)

After a hospitalization, some patients need intensive inpatient rehabilitation services such as physical, occupational, or speech therapy. To qualify for treatment in an inpatient rehabilitation setting, patients must be able to tolerate and benefit from three hours of therapy per day. These settings may be freestanding hospitals or specialized, hospital-based units.

How Medicare Reimburses IRFs

Medicare pays IRFs through a PPS. Under the IRF PPS, the IRF base rate is adjusted for geographic factors, patient characteristics (case mix group), facility characteristics (urban/rural, disproportionate share, indirect medical education), length of stay, and outlier payments. Case mix groups are informed primarily by the patient's condition (age, comorbidities, functional and cognitive statuses, and diagnoses requiring rehabilitation). Each case mix group has a national relative weight reflecting the expected relative costliness of treatment for patients in that specific case mix group compared with the average Medicare inpatient rehabilitation patient.

Approach to Stripping Payments

We multiply the base payment rate by the case mix group weight and omit any adjustments for wage index or facility characteristics. We then adjust for length of stay to arrive at our stripped payment. Where applicable, we add outlier payments but remove the wage index adjustment for these payments.

2.5.1.4. Long Term Care Hospitals (LTCHs)

Patients with clinically complex problems, such as multiple acute or chronic conditions, may need hospital care for extended periods of time. LTCHs must have an average Medicare length of stay greater than 25 days.

How Medicare Reimburses LTCHs

Medicare pays LTCHs through a PPS. Under the LTCH PPS, the LTCH base rate is adjusted for geographic factors, patient characteristics (Medicare severity long-term care [MS-LTC]-DRG), length of stay, and outlier payments. MS-LTC-DRGs are informed primarily by the patient's condition (age, gender, principal and secondary diagnoses, procedures, and discharge status). Each MS-LTC-DRG has a national relative weight reflecting the expected relative costliness of treatment for patients in that specific LTC-DRG compared with the average Medicare LTC patient.

Approach to Stripping Payments

We multiply the base payment rate by the MS-LTC-DRG weight and omit any adjustments for wage index. We then adjust for length of stay to arrive at our stripped payment. Where applicable, we add outlier payments but remove the wage index adjustment for these payments.

2.5.2. Outpatient Care Settings

Medicare pays for some outpatient services under the Outpatient Prospective Payment System (OPPS), including most hospital-based outpatient services. Outpatient services that do not fall under the OPPS are reimbursed using other fee schedules or payment systems (e.g., Medicare Clinical Diagnostic Laboratory Fee Schedule) as detailed later in this document.

2.5.2.1. Hospital Outpatient Services and Community Mental Health Centers (CMHCs)

Medicare beneficiaries receive a wide range of services in hospital outpatient departments. These vary from simple injections to complex procedures requiring anesthesia and can include emergency room visits as well as observation stays. CMHCs provide outpatient as well as partial hospitalization services to Medicare beneficiaries, including physician services, psychiatric nursing, counseling, and social services.

<u>How Medicare Reimburses Hospital Outpatient Services and CMHCs</u>

Medicare pays for most hospital outpatient services provided to Medicare beneficiaries using the OPPS. Partial hospitalization services furnished by CMHCs are also reimbursed under the OPPS. All services are paid according to ambulatory payment classifications (APCs), which group services according to similar clinical characteristics and in terms of resources required. Healthcare common procedure coding system (HCPCS) codes are grouped into over 500 APCs. Each APC is weighted and has a prospective payment amount associated with it. APC payments may be discounted when certain services or procedures, such as bilateral procedures, are provided.

A conversion factor (similar to a base payment) is multiplied by a wage index to account for geographic variations in hospitals' labor costs. This number is then multiplied by the APC relative weight. In addition, add-ons such as pass-through payments for new drugs and technical devices, outlier payments for high-cost services, and hold harmless payments for certain hospitals are applied.

<u>Approach to Stripping Payments</u>

We multiply the conversion factor by the APC weight and omit any adjustments for wage index. We then account for reduced or discontinued procedures, where applicable, as well as unit count to arrive at our OPPS stripped payment. We do not include pass-through payments for new drugs and technical devices or hold harmless payments for certain hospitals. For outpatient hospital services not paid under the OPPS, we apply the clinical lab fee schedule, ambulance fee schedule, physician fee schedule, DME/POS/PEN fee schedule, and Part B drug fee schedule where applicable. Also, where

applicable, we add outlier payments but remove the wage index adjustment for the payments.

2.5.2.2. Comprehensive Outpatient Rehabilitation Facilities (CORFs) and Outpatient Rehabilitation Facilities (ORFs)

Outpatient therapy services include physical therapy, occupational therapy, and speech-language pathology services. Medicare covers these services if they are furnished by a skilled professional, are appropriate and effective for a patient's condition, and are reasonable in terms of frequency and duration. The beneficiary must be under the care of a physician, have a treatable condition, and be improving.

<u>How Medicare Reimburses CORFs and ORFs</u>

Medicare pays for outpatient rehabilitation therapy according to fees established in the physician fee schedule. Under this fee schedule, a conversion factor set by Medicare is adjusted for complexity of service/expense as well as geographic factors. The unit of payment is each individual service. All services are classified and reported to CMS according to their HCPCS code. Payment rates are based on relative values units (RVUs) which account for the relative costliness of the following components of the service provided: clinician's work, practice expenses, and malpractice insurance. A separate geographic practice cost index (GPCI) for each of these work components reflects geographic differences in these costs in the market where the service is rendered.

<u>Approach to Stripping Payments</u>

We multiply the conversion factor by the work RVU, transitioned non-facility practice expense RVU, and malpractice insurance RVU weights and omit any adjustments for work GPCI, non-facility practice expertise GPCI, and/or malpractice insurance GPCI to arrive at our stripped payment.

2.5.2.3. Renal Dialysis Facilities (RDFs)

Individuals with end-stage renal disease require dialysis or renal transplant to survive. Medicare pays for both hemodialysis and peritoneal dialysis.

<u>How Medicare Reimburses RDFs</u>

Medicare pays dialysis providers a predetermined composite rate that is intended to cover the bundle of services, tests, certain drugs, and supplies required for either facility-based or home-based dialysis treatments. The composite rate is then adjusted for geographic factors. A drug add-on further supplements the payment, and CMS provides an additional adjustment for case mix using a patient's age, body surface area, and body mass index. Facility-based payments are capped at an amount equal to three dialysis sessions per week; however, home-based dialysis may be provided more frequently.

Approach to Stripping Payments

Given that renal dialysis payment rates are adjusted by patient-specific body measurements that are not available in our data, we begin with the actual payment made to an RDF for patient care (including patient out-of-pocket payments) and remove payment adjustment attributable to wages using the RDF wage index published by CMS.

2.5.2.4. Rural Health Clinics (RHCs)

RHCs are clinics that are located in areas designated by the Bureau of the Census as rural and by the Secretary of the Department of Health and Human Services as underserved. Services rendered by approved RHCs to Medicare beneficiaries are covered under Medicare.

How Medicare Reimburses RHCs

Payments to RHCs for covered services furnished to Medicare patients is made by an all-inclusive rate for each visit. The encounter rate includes services from providers as well as supplies. Each year Congress determines this RHC per visit payment limit.

Approach to Stripping Payments

We begin with the actual payment made to an RHC for patient care and remove payment adjustment attributable to wages using the skilled nursing facility (SNF) state-specific rural wage index published by CMS.

2.5.2.5. Federally Qualified Health Clinics (FQHCs)

FQHCs provide access to primary care in areas where primary care resources are constrained. FQHCs are required to be community-centered and either not-for-profit or public organizations that emphasize coordination of care.

How Medicare Reimburses FQHCs

Payments are made much like they are made to RHCs. FQHC payments are an all-inclusive per visit amount based on reasonable costs. The FQHC payment methodology includes one urban and one rural payment limit.

Approach to Payments

Given the resources necessary to determine whether each FQHC is located in a rural or urban area, we did not adjust for wages in the current data. We use the total payment received by the FQHC as the payment for a FQHC claim.

2.5.2.6. Ambulatory Surgical Centers (ASCs)

ASCs are distinct facilities that furnish only ambulatory surgery.

How Medicare Reimburses ASCs

Medicare pays ASCs through a PPS. The unit of service is the individual surgical procedure. All services are paid according to APCs, which group services according to similar clinical characteristics and in terms of resources required. Each APC is weighted and has a prospective payment amount associated with it. APC payments may be discounted when certain services or procedures, such as bilateral procedures, are provided.

A conversion factor (similar to a base payment) is multiplied by a wage index to account for geographic variations in ASCs' labor costs. This number is then multiplied by the APC relative weight.

Approach to Stripping Payments

We begin with the conversion factor, omit any adjustments for wage index, multiply by the APC weight, multiply by the unit count, and make adjustments for multiple, reduced, or continued procedures where applicable.

2.5.2.7. Laboratory Services

Clinical lab services are tests on specimens taken from the human body (e.g., blood or urine) and used to help physicians diagnose or assess health.

How Medicare Reimburses Laboratory Services

Medicare pays for laboratory services using state-specific fee schedules. Individual lab services are identified by a HCPCS code.

Approach to Standardizing Payments

For each lab service on the clinical diagnostic laboratory fee schedule, we calculate the standard unit payment by taking the average of the payments across all states. We then multiply the average payment for a particular service by the unit count for that service. For lab services reimbursed under the automated multi-channel chemistry code, we use the total payment received by the lab.

2.5.2.8. Ambulance Services

Medicare beneficiaries sometimes require ambulance services for transportation.

How Medicare Reimburses Ambulance Services

Medicare pays for ambulance services using a fee schedule that pays separately for type of mileage (ground or air) and level of support (based on RVUs) provided during the trip. Reimbursements are also adjusted for geographic differences in labor cost as well as for service within urban or rural locations. Mileage type and level of support are indicated on the ambulance fee schedule by HCPCS code.

Approach to Standardizing Payments

We first calculate the average of the urban and rural mileage rates for each type of mileage at each level of ambulance service support for each state, and use these average state mileage and service rates to calculate a national average mileage and service rate for each HCPCS code. We then multiply this national average rate by the unit count.

2.5.2.9. Part B Drugs

Medicare makes payments to physicians for drugs or biologicals that are administered by infusion or injection and not usually self-administered.

How Medicare Reimburses Part B Drugs

Medicare pays for Part B prescription drugs using a national fee schedule (i.e., there is no variation from state to state).

Approach to Payments

We assign the national fee schedule amount to all Part B Drug claims and multiply this amount by the unit count.

2.5.3. Other Care Settings

2.5.3.1. Skilled Nursing Facilities (SNFs)

Beneficiaries who need short-term skilled care on an inpatient basis following a hospital stay of at least three days are eligible to receive covered services in a SNF.

How Medicare Reimburses SNFs

Medicare pays for SNFs through a PPS. Under the SNF PPS, Medicare assigns a different per diem base payment rate to SNFs based on their urban or rural status for each of three components of care: a nursing component, a therapy component, and a non-case mix-adjusted component reflecting the costs of room and board and administrative services. Daily payments to SNFs are then determined by adjusting the base payment rates for geographic differences in labor cost and by adjusting the nursing component and therapy components of the base payment rates by patient characteristics (resource utilization groups [RUG]). RUGs are informed primarily by the patient's condition

(comorbidities, activities of daily living score, therapy and service use) and are intended to group patients with similar expected service needs. Each RUG has a nursing relative weight and a therapy relative weight reflecting the expected relative costliness of treatment for patients in that specific RUG compared with the average Medicare beneficiary in a SNF. In addition, SNFs receive a 128% increase in the Medicare PPS per diem payment for patients with acquired immunodeficiency syndrome (AIDS).

Approach to Standardizing Payments

We average the urban and rural SNF per diem base rates, multiply by the RUG weights, and omit adjustment factors for the wage index. We then multiply this number by the number of days the patient is in a SNF and add a 128% AIDS adjustment if applicable. For critical access hospitals' swing-bed SNF claims, we use the total payment received by the SNF and remove the portion of the payment attributable to wage differences across geographic locations using the SNF state-specific rural wage index published by CMS.

2.5.3.2. Home Health Agencies (HHAs)

Beneficiaries who are generally confined to their homes and need skilled care from a nurse, physical therapist, or speech therapist on a part-time or intermittent basis are eligible to receive certain medical services at home. Covered services delivered by HHAs include: skilled nursing care, physical, occupational, and speech therapy, medical social work, and home health aide services.

How Medicare Reimburses HHAs

Medicare pays HHAs using a PPS and purchases home health services in units of 60-day episodes. Under the HHA PPS, Medicare assigns a base payment rate which is first adjusted for geographic factors and then adjusted for patient characteristics (by assigning each patient to a home health resource group [HHRG]). HHRG assignments are based on clinical and functional status as well as service use, and have a national relative weight reflecting the costliness of patients in that group compared with the average Medicare home health patient. Adjustments are also made for patients who receive fewer than five home health visits, are transferred to another HHA, or are discharged and readmitted to the same HHA within the 60-day time frame. Further adjustments are made for outlier payments and non-routine medical supplies. When there are fewer than five home health visits in the 60-day time frame, Medicare pays HHAs using the Low Utilization Payment Adjustment (LUPA) per visit rate, which is discipline-specific and depends on whether the visit was for home health aide, medical social services, occupational therapy, physical therapy, skilled nursing, or speech language pathology therapy. HHAs receive an add-on for LUPA episodes that occur as initial episodes in a sequence of adjacent episodes, or as the only episode.

Approach to Stripping Payments

We multiply the base payment by the HHRG weight and omit adjustment factors for the wage index. We then modify this total if the patient is transferred to another HHA or discharged and readmitted to the same HHA before 60 days. We then add any DME/POS/Oxygen add-ons or outlier payments (after removing the wage index adjustment) when applicable. For patients with fewer than five home health visits in the 60-day time frame, we apply the LUPA per visit payment rates with LUPA add-ons when applicable.

2.5.3.3. Hospice

Terminally ill beneficiaries, defined as having a life expectancy of six months or less, may receive hospice care. Hospice benefits cover a wide range of services including: physicians, skilled nursing, counseling, medical social services, drugs for pain control and symptom management, physical, occupational, and speech therapy, home health aides, and inpatient respite care.

<u>How Medicare Reimburses Hospice</u>

Medicare pays hospices for each day a beneficiary is eligible and under hospice care regardless of the amount of services provided on any given day. Payments are made according to a fee schedule that has individual base payment amounts for four categories of care: routine home care, continuous home care, inpatient respite care, and general inpatient care. Each hospice payment rate is then adjusted for geographic factors. Routine home care, inpatient respite care, and general inpatient care are paid the geographically-adjusted daily rate. Continuous home care is paid a geographically-adjusted hourly rate when care is delivered during a period of crisis and is provided in the home for eight or more hours in a 24-hour period beginning at midnight. Any applicable physician fees are added to the total hospice payment.

<u>Approach to Stripping Payments</u>

For continuous home care, we divide the base payment by 24 hours and multiply it by the number of hours of care and add any physician fees where applicable. For routine home care, inpatient respite care, and general inpatient care, we multiply the base payment by the number of days of care and add any applicable physician fees.

2.5.4. Physicians, Physician Extenders, Social Work Services

Medicare beneficiaries sometimes require the care of physicians or physician extenders for a number of different clinical services.

<u>How Medicare Reimburses Physician, Physician Extenders, Social Work Services</u>

Medicare uses a fee schedule based on a list of services and their corresponding payment rates to compensate individual providers. Medicare pays a higher physician fee for services provided

in non-facility settings, such as physicians' offices, and a lower physician fee for services furnished in facilities, such as hospitals. Physician fees are lower in facility settings because physicians' practice costs are generally lower in facilities. Also, in this case, Medicare pays both the facility and the physician. Each service has a weight, or RVU, that measures the relative costliness of three components of resources used to provide physician services: physician work, practice expenses, and malpractice insurance.

Medicare also uses three GPCIs to adjust for geographic factors related to physician work, practice expenses, and malpractice insurance, respectively. To arrive at the payment amount a conversion factor is multiplied by the total of the RVU weight multiplied by the GPCI weight for each type of resource. Adjustments are then made for certain circumstances such as multiple surgical procedures performed on the same day for the same patient, preoperative and postoperative management without surgical care, or bilateral surgery. Adjustments in payment are also made for care given by non-physicians such as physician assistants and clinical social workers.

Approach to Stripping Payments

For services provided in a facility setting (e.g., the hospital outpatient department), we multiply the conversion factor by the work RVU, transitioned facility practice expense RVU, and malpractice insurance RVU weights, and omit any adjustments for work GPCI, facility practice expertise GPCI, and/or malpractice insurance GPCI. For services provided in a non-facility setting (e.g. a physician's office), we multiply the conversion factor by the work RVU, transitioned non-facility practice expense RVU, and malpractice insurance RVU weights, and omit any adjustments for work GPCI, non-facility practice expertise GPCI, and/or malpractice insurance GPCI. We then adjust this total for the circumstances listed in the paragraph above and make any adjustments for care given by non-physicians. This adjusted payment amount is then multiplied by the unit count of the service provided.

2.5.5. Durable Medical Equipment/Prosthetics and Orthotics/Parenteral and Enteral Nutrition (DME/POS/PEN)

Beneficiaries who require medical equipment, prosthetics, orthotics, other supplies, or parenteral and enteral nutrition to treat their illness receive it under DME/POS/PEN.

How Medicare Reimburses DME

Medicare pays for DME/POS/PEN using a combination of state-specific fee schedules (for DME/POS) and a national fee schedule (for PEN).

Approach to Standardizing Payments

For DME/POS claims, we average the payment rate across the state for each item (identified by HCPCS code) on the fee schedule. Where applicable, we adjust the payment rates for new, used, or rental equipment. We then multiply by the unit count. If a patient receives Part B drugs in conjunction with DME, we add the Part B drug payment.

For PEN claims, we assign items the amounts specified in the national fee schedule.

2.6. Model Development and Validation Samples

For model development, we used the full 2008 calendar year 100% sample of AMI patients to derive the cohort (Sample A). To define the outcome, we used the full calendar year of 2008 as well as January 2009 data to cover the 30 day episode-of-care period for index admissions in December 2008. All final model results presented in Sections 3.2 and 3.3 were produced using this sample. To determine variables for inclusion in the model (variable selection), we used a randomly selected 50% sample of the full 2008 sample (Sample A1). We used Sample A1 plus the other half of the full 2008 sample (Sample A2) to assess model validity. Table 2 summarizes the different data samples and their purposes.

Table 2. 2008 AMI Payment Model Development and Validation Sample

Sample	% of Total Sample	Purpose
Sample A (Full Sample)	100%	Development (cohort, outcome definition, and determination of functional form of risk-adjustment model)
Sample A1 (Development)	50% (randomly selected)	Development (variable selection; validity testing)
Sample A2 (Validation)	50% (remaining 50%)	Development (validity testing)

2.7. Approach to Risk Adjustment

The goal of risk adjustment for this measure is to account for patient age, prior procedures (e.g., PCI and/or CABG), and comorbid conditions that are clinically relevant and have strong relationships with the outcome, while illuminating important quality differences between hospitals.

Comorbidities for inclusion in risk adjustment are identified in administrative claims during the 12 months prior to and including the index admission. To assemble the more than 15,000 ICD-9 codes into clinically coherent variables for risk-adjustment, the measure employs the publicly available CMS condition categories (CCs) to group ICD-9 codes into CCs,[11] and selects comorbidities on the basis of clinical relevance and statistical significance.

The measure does not adjust for the patient's admission source or discharge disposition (e.g., a skilled nursing facility) because these factors are associated with the structure of the health care system and the different care patterns the measure seeks to illuminate. Because hospitals should not be held to different standards of care based on the demographics of their patients, the measure also does not adjust for socioeconomic status (SES), gender, race, or ethnicity. Variation in payments associated with these characteristics may indicate differences in the care provided to vulnerable populations, and adjusting for these factors would obscure these disparities. The measure does not adjust for hospital characteristics either (e.g., teaching status), since this would hold different types of hospitals to different standards, and because such characteristics may exist on a causal pathway to the outcome rather than act as confounders. This approach is consistent with NQF guidelines.[12]

2.7.1. Complications of Hospitalization

Complications occurring during hospitalization are not comorbid illnesses and may reflect hospital quality of care; therefore, they should not be used for risk adjustment. Although adverse events during hospitalization may increase the payments for an AMI episode of care, including them as covariates in a risk-adjusted model could obscure payment differentials related to the quality of care delivered by hospitals. YNNHSC/CORE has previously reviewed every CMS-CC and identified those which, if they only occur during the index hospitalization, would be considered potential complications rather than comorbidities. For example, fluid, electrolyte or base disorders; sepsis; and acute liver failure are CMS-CCs that could potentially be complications of care (Appendix A).

2.7.2. Case Mix Adjustment: Candidate Comorbid Risk Variables

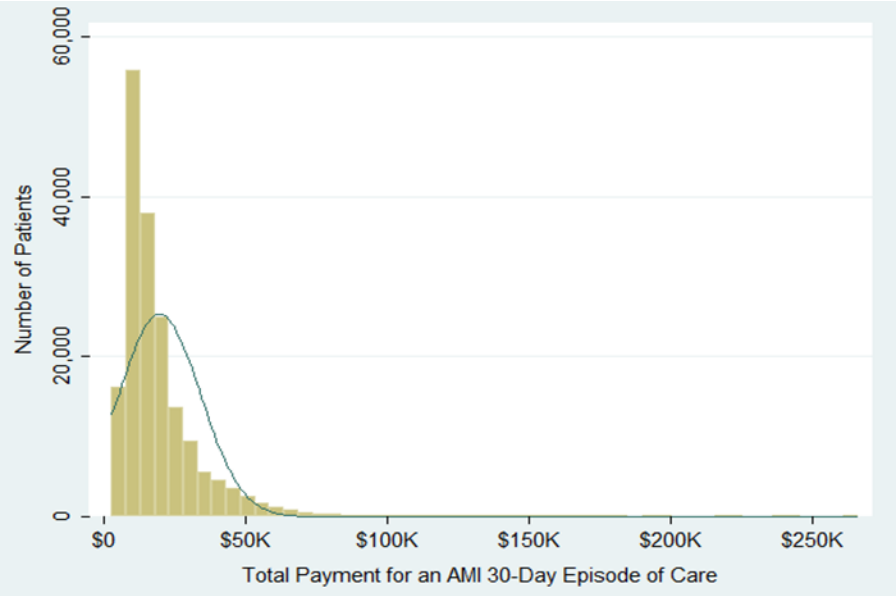
Our goal was to develop a parsimonious model that accounted for differences in patient case mix at the time of index admission that were strongly associated with total payment for an AMI 30-day episode of care. The candidate variables for the model were derived from secondary diagnoses of the index hospital stay (excluding potential complications), inpatient data, outpatient hospital data, and carrier files for physician, radiology and laboratory services during the 12 months prior to the index hospital stay.

To select candidate variables, we started with the 189 Condition Categories (CCs). We used the ICD-9-to-CC assignment map, which is maintained by CMS and posted on the QualityNet website. A team of clinicians reviewed all 189 CCs and excluded those that were not relevant to the Medicare population or not clinically relevant to the AMI payment outcome (e.g., attention deficit disorder, female infertility). Some of these CCs were combined into clinically coherent groups. The remaining clinically relevant CCs, along with several other adjustment variables including age, history of PCI, and history of CABG, were selected as candidate comorbid risk variables. A complete list of candidate variables is presented in Table 3.

2.7.3. Case Mix Adjustment: Choice of Functional Form

As is typical with data for healthcare payments, our dependent variable – total payment for an AMI 30-day episode of care – is both right-skewed and leptokurtotic (skewness= 2.7; kurtosis = 15.4). This is illustrated in Figure 3. To address estimation problems that can arise with non-normally distributed data, we employed the algorithm suggested by Manning & Mullahy (2001).[13] Using this algorithm and Sample A, we compared several alternative models in order to determine the best estimation approach. Based on these assessments, we chose to estimate a generalized linear model with a log link and an inverse Gaussian distribution.

Figure 3. Distribution of Unadjusted Patient-Level Total Payments for an AMI 30-Day Episode of Care (2008 Sample A; N=180,562 Patients)



2.7.4. Final Variable Selection

To inform variable selection, we performed a modified approach to stepwise generalized linear model regression. We used Sample A1 to create 1,000 bootstrap samples. For each sample, we ran a generalized linear model that included all candidate variables. Specifically, let Y_{ij} denote the outcome (i.e., total payment for an AMI 30-day episode of care) for the jth patient admitted to the ith hospital; and Z_{ij} denotes the candidate risk factors where $\mathbf{Z}_{ij} = (Z_{1ij}, Z_{2ij}, \ldots, Z_{pij})$ is a set of *p* patient-specific variables (e.g., age, prior PCI, comorbid conditions). Let I denote the total number of hospitals and n_i the number of index patient stays in hospital i. We assume the outcome is related linearly to the risk factors via a known link function, h(·), as follows:

$$h(Y_{ij}) = \alpha + \beta \mathbf{Z}_{ij} \qquad (1)$$

In our case, h(·) is the log link and we assumed an inverse Gaussian error distribution. We estimated these generalized linear models using the SAS software system (SAS 9.3 GENMOD procedure).

The results were summarized to show the percentage of times that each of the candidate variables was significantly associated with AMI payment (at the $p<0.05$ level) in the 1,000 bootstrap samples (e.g., 70% would mean that the candidate variable was significant at $p<0.05$

in 70% of the bootstrap samples). We also assessed the direction and magnitude of the regression coefficients.

The working group reviewed these results and decided to retain all risk-adjustment variables above a 90% cutoff (i.e., to retain variables that were significant at the 0.05 level in at least 90% of the bootstrap samples). We chose the 90% cutoff because variables above this threshold demonstrated a relatively robust association with AMI payment and were clinically relevant. The final risk-adjusted AMI payment model included 32 variables (Table 4).

Table 3. 2008 AMI Payment Model Candidate Variables

Risk Adjustment Category	Risk Adjustment Variable	CC
Demographics	Age (65 – 74)	N/A
Demographics	Age (75 – 84)	N/A
Demographics	Age (>=85)	N/A

2.8. Statistical Approach to Risk-Standardized Payment (RSP)

To calculate hospital-specific RSPs, we estimate hierarchical generalized linear models using Sample A. This strategy accounts for within-hospital correlation of the observed outcomes and accommodates the assumption that underlying differences in quality across hospitals lead to systematic differences in outcomes. We model the total payment as a function of patient age, select comorbidities, and history of PCI and/or CABG with a hospital-specific random effect.

We use the following strategy to calculate the hospital-specific RSPs. We calculate these payments as the ratio of "predicted" AMI payment to expected AMI payment, and multiply by the national unadjusted average AMI payment. The predicted AMI payment for each hospital is estimated using its patient mix and an estimated hospital-specific intercept. The expected AMI payment for each hospital is estimated given the same patient mix but the average intercept among all hospitals in the sample.

Operationally, the expected AMI payment for each hospital is obtained by summing the expected AMI payments for all patients in the hospital. The expected AMI payment for each patient is calculated via the hierarchical model by applying the estimated regression coefficients to the observed patient characteristics and adding the average intercept. The predicted AMI payment for each hospital is

calculated by summing the predicted AMI payments for all patients in the hospital. The predicted AMI payment for each patient is calculated through the hierarchical model by applying the estimated regression coefficients to the patient characteristics observed and adding the hospital-specific intercept.

More specifically, we use a hierarchical generalized linear model to account for the natural clustering of observations within hospitals and adjust for the selected risk factors. The model employs a log link and an inverse Gaussian error distribution with a hospital-specific random effect as follows:

$$h(Y_{ij}) = \alpha_i + \beta \mathbf{Z}_{ij} \quad (2)$$

$$\alpha_i = \mu + \omega_i; \qquad \omega_i \sim N(0, \tau^2) \quad (3)$$

where α_i represents the hospital-specific intercept, $\mathbf{Z}_{ij}$ is defined the same as in equation (1), μ is the average intercept across all hospitals in the sample, and τ^2 is the between-hospital variance component.[14] This model separates within-hospital variation from between-hospital variation. The hierarchical generalized linear models are estimated using the SAS software system (SAS 9.3 GLIMMIX procedure).

2.8.1 Hospital Performance Reporting

Using the selected set of risk factors, we fit the hierarchical generalized linear model defined by Equations (2) - (3) and estimate the parameters, $\hat{\mu}$, $\{\alpha_i, \alpha_2, \ldots, \alpha_I\}$, $\hat{\beta}$, and $\hat{\tau}^2$. We calculate a standardized outcome measure, RSP_i, for each hospital by computing the ratio of the predicted AMI payment to the expected AMI payment, and multiplying by the national unadjusted average AMI payment, $\bar{y}$. Specifically, we calculate

Predicted $\hat{y}_{ij}(Z_{ij}) = h^{-1}(\hat{a}_i + \hat{\beta}\mathbf{Z}_{ij})$ (4)

Expected $\hat{e}_{ij}(Z_{ij}) = h^{-1}(\hat{\mu} + \hat{\beta}\mathbf{Z}_{ij})$ (5)

$$\widehat{RSP}_i(Z_{ij}) = \frac{\sum_{j=1}^{n_i} \hat{y}_{ij}(Z)}{\sum_{j=1}^{n_i} \hat{e}_{ij}(Z)} \times \bar{y} \quad (6)$$

Again, i indexes hospitals, j indexes patients within hospitals, and n_i is the number of patients within hospital i. If "predicted" total payment is higher (or lower) than "expected" total payment for a given hospital, then its $\widehat{RSP}_i$ will be higher (or lower) than the national unadjusted average payment. For each hospital, we can compute an interval estimate of RSP_i to characterize the level of uncertainty around the point estimate using bootstrapping simulations. The point estimate and interval estimate can be used to characterize and compare hospital performance (e.g., higher than expected, as expected, or lower than expected). See Figure 4 for our overall analysis steps.

2.8.2 Creating Interval Estimates

Because the statistic described in Equation 6 (Section 2.8.1), i.e., $\widehat{RSP}_i$, is a complex function of parameter estimates, we use the re-sampling technique – bootstrapping – to derive an interval estimate. Bootstrapping has the advantage of avoiding unnecessary distributional assumptions.

Algorithm:

Let *I* denote the total number of hospitals in the sample. We repeat steps 1-4 below for B times, where *B* is the number of bootstrap samples desired (with b indexes the *b*th bootstrap sample):

1. Sample *I* hospitals with replacement.

2. Fit the hierarchical generalized linear model using all patients within each sampled hospital. If some hospitals are selected more than once in a bootstrapped sample, we treat them as distinct so that we have *I* random effects to estimate the variance components. At the conclusion of Step 2, we have:
   a. $\hat{\beta}^{(b)}$ (estimated regression coefficients of the risk factors)

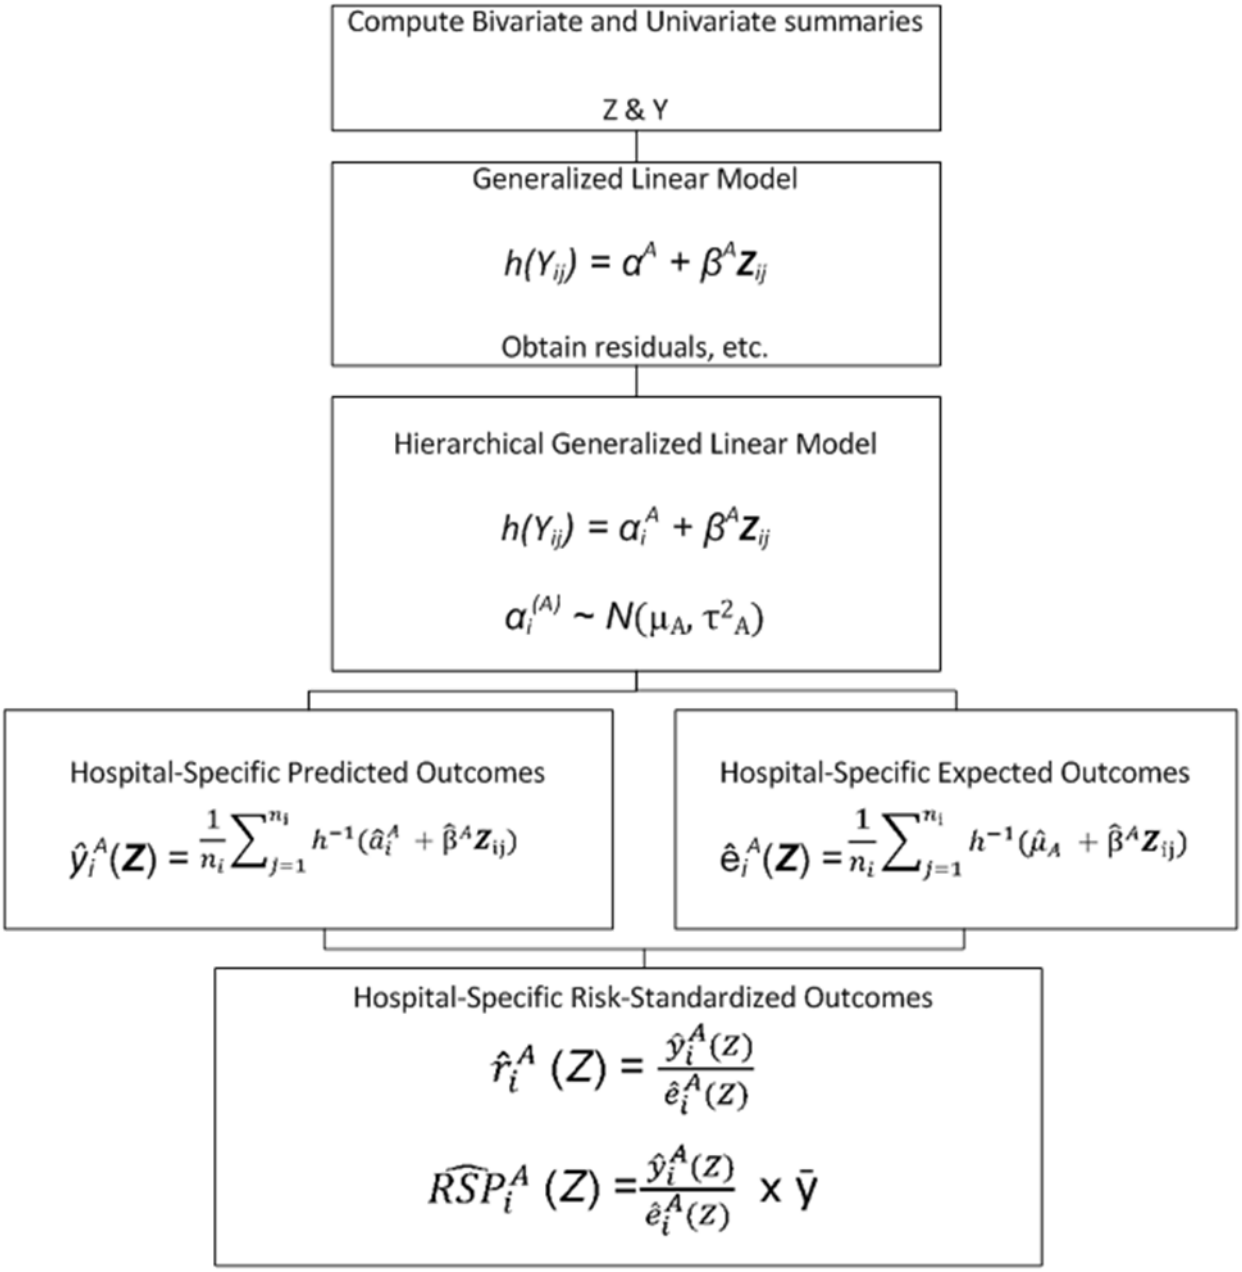
   b. The parameters governing the random effects, hospital adjusted outcomes, distribution, $\hat{\mu}^{(b)}$ and $\hat{\tau}^{2(b)}$
   c. The set of hospital-specific intercepts and corresponding variances, $\{\hat{\alpha}_i^{(b)}, \widehat{var}(\alpha_i^{(b)}); i = 1,2, \dots, I\}$

3. We generate a hospital random effect by sampling from the distribution of the hospital-specific distribution obtained in Step 2c. We approximate the distribution for each random effect by a normal distribution. Thus, we draw $\alpha_i^{(b*)} \sim N(\hat{\alpha}_i^{(b)}, \widehat{var}(\hat{\alpha}_i^{(b)}))$ for the unique set of hospitals sampled in Step 1.

4. Within each unique hospital *i* sampled in Step 1, and for each patient *j* in that hospital, we calculate $\hat{y}_{ij}^{(b)}$, $\hat{e}_{ij}^{(b)}$, and $\widehat{RSP}_i(Z)^{(b)}$ where $\hat{\beta}^{(b)}$ and $\hat{\mu}^{(b)}$ are obtained from Step 2 and $\hat{\alpha}_i^{(b*)}$ is obtained from Step 3.

Ninety-five percent interval estimates (or alternative interval estimates) for the hospital-standardized outcome can be computed by identifying the 2.5th and 97.5th percentiles of the B estimates (or the percentiles corresponding to the alternative desired intervals).[15]

Figure 4. Analysis Steps



3. RESULTS

3.1. Model Development and Validation Results

Table 5 shows the number of index admissions and number of hospitals associated with each of the samples used for measure development and validation as outlined in Section 2.6.

Table 5. Description of 2008 Development and Validation Samples

Sample	% of Total Sample	Purpose	Number of Index Admissions	Number of Hospitals
Sample A (Full Sample)	100%	Development (cohort, outcome definition, determination of functional form of risk-adjustment model)	180,562	4,151
Sample A1 (Development)	50% (randomly selected)	Development (variable selection; validity testing)	90,281	3,904
Sample A2 (Validation)	50% (remaining 50%)	Development (validity testing)	90,281	3,873

The frequencies of final selected risk factors for all samples, as shown in Table 6, are consistent across the development and validation samples.

Table 6. 2008 AMI Payment Model Risk Factor Frequencies in Development, Validation, and Full Samples

Risk Adjustment Category	Risk Adjustment Variable	2008 Sample A1 (%)	2008 Sample A2 (%)	2008 Sample A (%)
Demographics	Age (65 – 74)	31.09	31.13	31.11

3.1.1. Results of Risk-Adjustment Model in Development and Validation Samples

Table 7 reports the estimated coefficients, standard errors, payment ratios (PR) (i.e., exponentiated coefficient estimate), and 95% confidence intervals for the PR associated with each risk factor generated from the 2008 development sample and Table 8 presents the same information for the validation sample. PRs are similar in both samples.

Table 7. Generalized Linear Model Results for 2008 Development Sample A1
(N=90,281 at 3,904 hospitals)

Risk Adjustment Category	Risk Adjustment Variable	Estimate	Standard Error	Payment Ratio (PR)	95% Confidence Interval for PR

Other Comorbidity	Internal Injuries (CC 160)	0.171	0.022	1.186	(1.135-1.239)

For each generalized linear model, we compute seven summary statistics to assess model performance: calibration (a measure of over-fitting)[*], predictive ratios by deciles and top 1% of predicted payment, distribution of residuals, mean absolute prediction error (MAPE), root–mean-square error (RMSE), R^2, and model chi-square. Model performance results are summarized in Table 9.

Over-fitting can result in the phenomenon in which a model describes the relationship between predictive variables and the outcome well in the development sample, but fails to provide valid predictions in new patients. Since the γ_0 in the validation sample is close to zero and the γ_1 is close to one, there is little evidence of over-fitting.

A predictive ratio is an estimator's ratio of predicted outcome to observed outcome (Ash & Byrne-Logan 1998).[1] A predictive ratio of 1.0 indicates an accurate prediction. A ratio greater than 1.0 indicates overprediction, and a ratio less than 1.0 indicates underprediction.

R^2 is the R^2 from a regression of observed outcome on the predicted outcome (Jones 2010).[16]

Table 9. Generalized Linear Model Performance for 2008 Development and Validation Samples

Indices	2008 Development Sample A1	2008 Validation Sample A2
Number of hospital stays	90,281	90,281
Number of hospitals	3,904	3,872
Unadjusted mean payment	$19,879	$19,911
Calibration (γ0, γ1)	(0,1)	(-0.226,1.023)
Discrimination – Predictive Ratios First Decile (lowest)	0.96	0.95
Discrimination – Predictive Ratios Second Decile	1.01	1.01
Discrimination – Predictive Ratios Third Decile	1.02	1.03
Discrimination – Predictive Ratios Fourth Decile	1.03	1.03
Discrimination – Predictive Ratios Fifth Decile	1.02	1.04
Discrimination – Predictive Ratios Sixth Decile	1.04	1.03
Discrimination – Predictive Ratios Seventh Decile	1.03	1.02
Discrimination – Predictive Ratios Eighth Decile	0.99	1.01
Discrimination – Predictive Ratios Ninth Decile	0.97	0.96
Discrimination – Predictive Ratios Tenth Decile (highest)	0.93	0.93
Discrimination – Predictive Ratios Top 1%	0.96	0.93
Residuals Lack of Fit (Pearson Residual Fall %) <-2	0.00	0.00
Residuals Lack of Fit (Pearson Residual Fall %) [-2, 0)	64.66	64.43

[*] Over-Fitting Indices (γ_0, γ_1) provide evidence of over-fitting and require several steps to calculate. Let *b* denote the *estimated vector* of regression coefficients. *Predicted Payment* ($\hat{p}$) = exp{Xb}), and *Z* = *Xb* (e.g., the linear predictor that is a scalar value for everyone). A new generalized linear model that includes only an intercept and a slope by regressing the log of Y on Z is fitted in the validation sample; e.g., Ln (E(Y|Z))= $\gamma_0 + \gamma_1 Z$. Estimated values of γ_0 far from 0 and estimated values of γ_1 far from 1 provide evidence of over-fitting.

Residuals Lack of Fit (Pearson Residual Fall %) [0, 2)	29.54	29.80
Residuals Lack of Fit (Pearson Residual Fall %) [2+	5.80	5.76
MAPE	9711	9661
RMSE	14060	13984
R^2	0.050	0.055
Model χ^2 (DF)	2.117 (30)	2.065 (30)

3.2. Final Model Results

The final hierarchical generalized linear regression model was created using the full 2008 sample (i.e., Sample A). The list of covariates and estimates of coefficients, standard errors, and payment ratios are shown in Table 10.

Table 10. Hierarchical Generalized Linear Model Results for Full 2008 Sample

Risk Adjustment Category	Risk Adjustment Variable	Coefficient Estimate	Standard Error	Payment Ratio (PR)	95% Confidence Interval for PR
Intercept	N/A	9.807	0.006	-	-
Demographics	Age (65 – 74)	0.231	0.004	1.260	(1.249 – 1.270)

3.2.1. Distribution of Unadjusted and Adjusted Hospital-Specific AMI 30-Day Episode-of-Care Payment

Both unadjusted and adjusted payments from AMI admission to 30 days post-admission vary considerably across hospitals (Table 11). For hospitals with at least 25 cases, the hospital unadjusted AMI 30-day episode-of-care payment ranges from $12,282 to $37,482 across 1,846 hospitals with a median (interquartile range) of $19,683 ($17,880, $21,585). The mean ± SD hospital unadjusted payment is $19,799 ± $2,829 (Figure 5). After adjusting for patient case mix, the risk-standardized payment at the hospital-level has a median (interquartile range) of $20,152 ($19,191, $21,211) (Figure 6). The mean ± SD risk-standardized hospital payment is $20,207 ± $1,478, ranging from $15,251 to $27,317 across 1,846 hospitals.

While we include all hospitals when estimating the risk-adjustment model, we exclude hospitals with fewer than 25 cases total from the summary statistics below, since estimates for hospitals with fewer cases are less reliable, and CMS's past approach to public reporting has been not to report these results. The volume of AMI hospitalizations among the included hospitals ranges from 25 to 474 index AMI admissions, with a mean of 88 index admissions and a median of 66 index admissions.

Since the initial development of the measure, we updated the 2008 cohort as described on page 15 and included AMI admissions from 2009. We recalculated the distribution of unadjusted payments and the estimated payment ratios in the risk-adjustment model for 2008. We also calculated analogous estimates for the 2009 and combined 2008-2009 cohorts. These updates are detailed in Appendix C.

Table 11. Distribution of Unadjusted and Risk-Standardized Payments for Hospitals with a Minimum of 25 AMI Index Admissions

Summary Statistic	AMI Episode-of-Care Payment (Unadjusted)	AMI Episode-of-Care Payment (Risk-Standardized)
Mean	$19,799	$20,207
SD	$2,829	$1,478
Min	$12,282	$15,251
10th Percentile	$16,232	$18,323
25th Percentile	$17,880	$19,191
Median	$19,683	$20,152
75th Percentile	$21,585	$21,211
90th Percentile	$23,378	$22,114
Max	$37,482	$27,317

Figure 5. Distribution of AMI Episode-of-Care Unadjusted Payment for Hospitals with a Minimum of 25 AMI Index Admissions

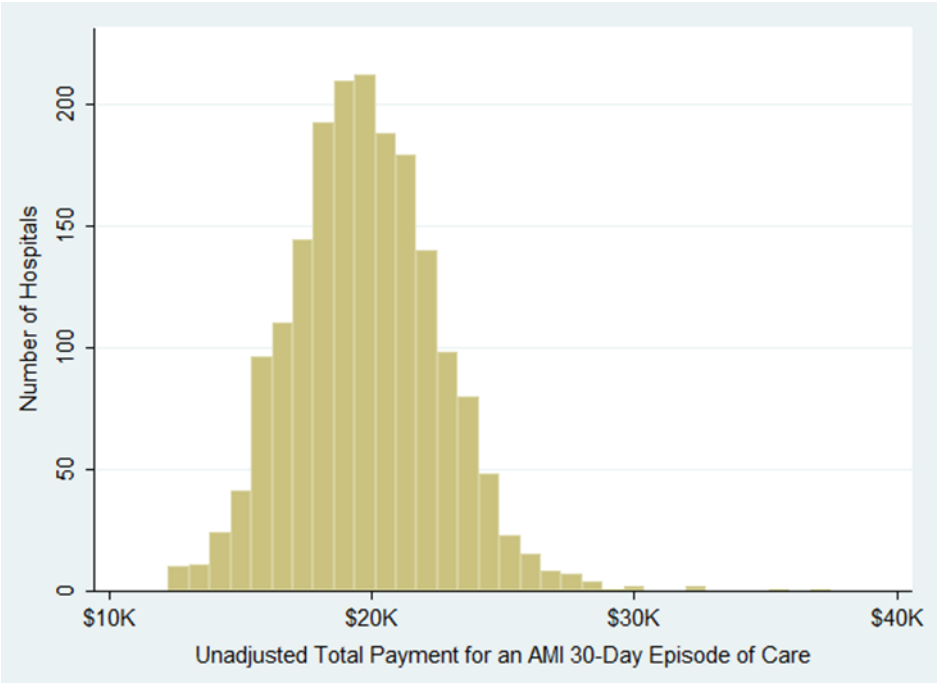

Figure 6. Distribution of AMI Episode-of-Care RSP for Hospitals with a Minimum of 25 AMI Index Admissions

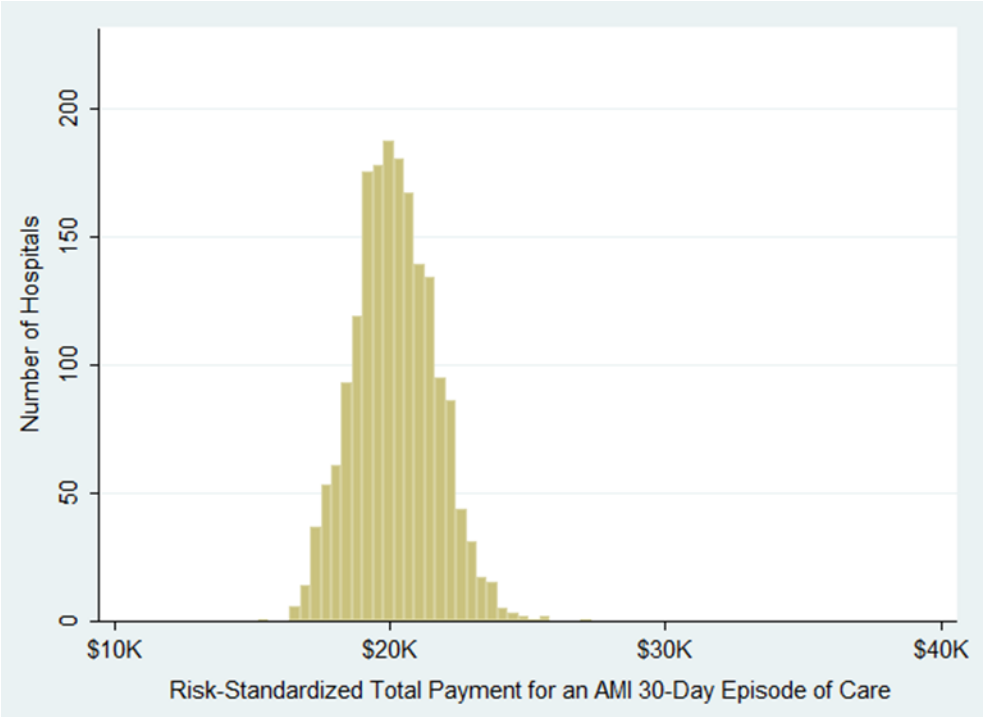

3.3. Measure Testing

3.3.1. Reliability Testing

Below we discuss data element reliability. Measure reliability testing was completed with a second year of data and details on the testing can be found in **Error! Reference source not found.**Appendix C.

3.3.1.1. Data Element Reliability

In constructing the AMI payment measure we aim to utilize only those data elements from the claims that have both face validity and reliability. We avoid the use of fields that are coded inconsistently across hospitals or providers. Additionally, CMS has several hospital auditing programs in place to assess overall claims code accuracy, to ensure appropriate billing, and to recoup overpayment. CMS routinely conducts data analyses to identify potential problem areas and detect fraud, and audits important data fields used in our measures, including diagnosis and procedure codes and other elements that are consequential to payment.[17]

3.3.2. Validity Testing

3.3.2.1. Validity of Claims-based Measures

Our team has demonstrated the validity of claims-based measures for profiling hospitals for a number of prior measures by comparing either the measure results or the individual data elements against medical records. CMS validated the six NQF-endorsed claims-based measures currently in public reporting (i.e., mortality and readmission measures for AMI, heart failure, and pneumonia) with models that used medical record-abstracted data for risk adjustment. Specifically, claims model validation was conducted by building comparable models using abstracted medical record data for risk adjustment for heart failure patients (National Heart Failure data), AMI patients (Cooperative Cardiovascular Project data) and pneumonia patients (National Pneumonia Project dataset). When both models were applied to the same patient population, the hospital risk-standardized mortality and readmission rates estimated using the claims-based risk-adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting.

We have also completed two national, multi-site validation efforts for two procedure-based complications measures: primary elective hip/knee arthroplasty and implantable cardioverter defibrillator (ICD). Both projects demonstrated strong agreement between complications coded in claims and abstracted from medical record data. These validation efforts suggest that such claims data variables are valid across a variety of conditions.

3.3.2.2. Validity of Development Process

We are developing this measure in consultation with national guidelines for publicly reported outcomes measures, with outside experts, and with the public. The measure is consistent with the technical approach to outcomes measurement set forth in National Quality Forum (NQF) guidance for outcomes measures,[18] CMS Measure Management System guidance, and the guidance articulated in the American Heart Association scientific statement, "Standards for Statistical Models Used for Public Reporting of Health Outcomes.[19]

In order to examine the face validity of our methods for estimating payments for an AMI episode of care, we compared our approach with two other measures that estimate payments for episodes of care. Specifically, we compared our methods with the:

- **American Board of Medical Specialties (ABMS) Acute Myocardial Infarction Episode of Care**, which estimates the cost of an episode of care for AMI at the hospital-level from the date of admission through 30 days post-admission for patients > 18 years. They use claims data from all payers, including Medicare and private insurance. They standardize prices across three components of care: inpatient facility, ambulatory pharmacy, and "all other" (e.g. evaluation and management, procedures, imaging, tests, DME). Costs at the inpatient facility level are calculated based on DRG-level information and length of stay. Total inpatient costs are divided by inpatient days to arrive at a per diem multiplier. This per diem multiplier is used to calculate the inpatient facility cost for each unique episode of care. A similar strategy is applied to ambulatory pharmacy and "all other" costs. Risk adjustment includes comorbid conditions identified in the 12 months preceding the index AMI admission using both inpatient and outpatient claims. The hospital is the unit of reporting.
- **CMS Medicare Spending per Beneficiary (MSPB) measure**, which estimates the cost of an episode of care for all inpatient diagnoses at the hospital-level from 3 days prior to admission through 30 days post-discharge for Medicare FFS beneficiaries 18 years and older. Their cost outcome includes patient copayments and excludes geographic and policy adjustments. Risk adjustment includes age, hierarchical condition categories, enrollment status, long-term care variables, variable interaction terms, and MS-DRGs present 90 days prior to index admission. The hospital is the unit of reporting.

Although our measure is being developed independently of those above, we share several key decisions:

1. *Include episode of care*: Like ours, both measures begin with a hospitalization and end 30 days after admission (ours, ABMS) or discharge (MSPB). Conceptually, this strategy groups together those medical transactions that are temporally related to a hospitalization. In this way, the care provided during hospitalization as well as the transition of care to post-discharge settings is attributed to the provider or hospital of the index admission.
2. *Isolate resource utilization:* Like ours, both measures attempt to isolate payment differentials due to resource utilization by removing payment adjustments that do

not reflect the clinical care delivered, such as geographic factors and policy adjustments (ours, MSPB), or standardizing payment amounts for isolated services, labs, or supplies (ABMS).

3. *Perform risk adjustment*: Like ours, both measures employ a thorough and transparent approach to risk adjustment, although the specific risk adjustment strategies differ technically.

In addition, we surveyed the TEP and asked each member to assess the face validity of our measure by rating the following statement using a six-point scale (1=Strongly Disagree, 2=Moderately Disagree, 3=Somewhat Disagree, 4=Somewhat Agree, 5=Moderately Agree, and 6=Strongly Agree):

> "This is a measure of payments for Medicare patients for a 30-day AMI episode-of-care. The measure removes policy adjustments that are independent of care decisions and risk-adjusts based on case mix. The measure is intended to provide CMS a tool to compare payments across hospitals nationally to identify hospitals that have notably higher or lower payments associated with AMI care. To what extent does the committee agree that this measure accomplishes this purpose?"

Among the 8 TEP members who provided a response, 3 responded "Moderately Agree" and 5 reported "Strongly Agree".

4. MAIN FINDINGS / SUMMARY

We present a hierarchical generalized linear regression model for assessing hospital-level, risk-standardized payments for a 30-day episode of care associated with an index admission for AMI. Our approach to model development and risk adjustment is consistent with quality measure methods recommendations for publicly reported outcomes measures from NQF, CMS, and the American Heart Association scientific statement.[6,7,8,9] This proposed measure is based on administrative claims data for FFS Medicare beneficiaries 65 years and older, and is being developed with extensive input from clinical and methodological experts with knowledge and experience relevant to quality measurement.

The study sample is appropriately defined, consisting of patients having an inpatient stay with a primary discharge diagnosis of AMI. The outcome is measured using stripped or standardized payments for Medicare patients starting with the index admission and continuing 30 days post-admission across all care settings, services, and supplies. The risk-adjustment process accounts for patient age, history of PCI and/or CABG, and comorbid conditions identified from: secondary diagnoses of the index hospital stay (excluding potential complications), inpatient data, outpatient hospital data, and carrier files for physician, radiology, and laboratory services during the 12 months prior to the index admission. The hierarchical modeling accounts for hospital case mix and the clustering of patients within hospitals, thereby making the measure suitable for public reporting.

We find substantial variation in risk-standardized payments for an AMI episode of care across hospitals. Implementation of this measure in conjunction with the publicly reported AMI mortality measure has the potential to improve the efficiency of care for patients with AMI. Although the payment methodology is developed in an AMI cohort, it can easily be applied to other disease conditions such as heart failure and pneumonia.

6. APPENDICES

Appendix A. Potential Complications in the Index Admission for AMI Payment Model

CC #	Description	Potential Complication in Index Admission
CC 1	HIV/AIDS	No
CC 2	Septicemia/Shock	Yes
CC 3	Central Nervous System Infection	No
CC 4	Tuberculosis	No
CC 5	Opportunistic Infections	No
CC 6	Other Infectious Diseases	Yes
CC 7	Metastatic Cancer and Acute Leukemia	No
CC 8	Lung, Upper Digestive Tract, and Other Severe Cancers	No
CC 9	Lymphatic, Head and Neck, Brain, and Other Major Cancers	No
CC 10	Breast, Prostate, Colorectal and Other Cancers and Tumors	No
CC 11	Other Respiratory and Heart Neoplasms	No
CC 12	Other Digestive and Urinary Neoplasms	No
CC 13	Other Neoplasms	No
CC 14	Benign Neoplasms of Skin, Breast, Eye	No
CC 15	Diabetes with Renal Manifestation	No
CC 16	Diabetes with Neurologic or Peripheral Circulatory Manifestation	No
CC 17	Diabetes with Acute Complications	Yes
CC 18	Diabetes with Ophthalmologic Manifestation	No
CC 19	Diabetes with No or Unspecified Complications	No
CC 20	Type I Diabetes Mellitus	No
CC 21	Protein-Calorie Malnutrition	No
CC 22	Other Significant Endocrine and Metabolic Disorders	No
CC 23	Disorders of Fluid/Electrolyte/Acid-Base	Yes
CC 24	Other Endocrine/Metabolic/Nutritional Disorders	No
CC 25	End-Stage Liver Disease	No
CC 26	Cirrhosis of Liver	No
CC 27	Chronic Hepatitis	No
CC 28	Acute Liver Failure/Disease	Yes
CC 29	Other Hepatitis and Liver Disease	No
CC 30	Gallbladder and Biliary Tract Disorders	No
CC 31	Intestinal Obstruction/Perforation	Yes
CC 32	Pancreatic Disease	No
CC 33	Inflammatory Bowel Disease	No
CC 34	Peptic Ulcer, Hemorrhage, Other Specified Gastrointestinal Disorders	Yes
CC 35	Appendicitis	No
CC 36	Other Gastrointestinal Disorders	No
CC 37	Bone/Joint/Muscle Infections/Necrosis	No
CC 38	Rheumatoid Arthritis and Inflammatory Connective Tissue Disease	No
CC 39	Disorders of the Vertebrae and Spinal Discs	No
CC 40	Osteoarthritis of Hip or Knee	No
CC 41	Osteoporosis and Other Bone/Cartilage Disorders	No
CC 42	Congenital/Developmental Skeletal and Connective Tissue Disorders	No

CC #	Description	Potential Complication in Index Admission
CC 43	Other Musculoskeletal and Connective Tissue Disorders	No
CC 44	Severe Hematological Disorders	No
CC 45	Disorders of Immunity	No
CC 46	Coagulation Defects and Other Specified Hematological Disorders	Yes
CC 47	Iron Deficiency and Other/Unspecified Anemias and Blood Disease	No
CC 48	Delirium and Encephalopathy	Yes
CC 49	Dementia	No
CC 50	Senility, Nonpsychotic Organic Brain Syndromes/Conditions	No
CC 51	Drug/Alcohol Psychosis	No
CC 52	Drug/Alcohol Dependence	No
CC 53	Drug/Alcohol Abuse, Without Dependence	No
CC 54	Schizophrenia	No
CC 55	Major Depressive, Bipolar, and Paranoid Disorders	No
CC 56	Reactive and Unspecified Psychosis	No
CC 57	Personality Disorders	No
CC 58	Depression	No
CC 59	Anxiety Disorders	No
CC 60	Other Psychiatric Disorders	No
CC 61	Profound Mental Retardation/Developmental Disability	No
CC 62	Severe Mental Retardation/Developmental Disability	No
CC 63	Moderate Mental Retardation/Developmental Disability	No
CC 64	Mild/Unspecified Mental Retardation/Developmental Disability	No
CC 65	Other Developmental Disability	No
CC 66	Attention Deficit Disorder	No
CC 67	Quadriplegia, Other Extensive Paralysis	No
CC 68	Paraplegia	No
CC 69	Spinal Cord Disorders/Injuries	No
CC 70	Muscular Dystrophy	No
CC 71	Polyneuropathy	No
CC 72	Multiple Sclerosis	No
CC 73	Parkinson's and Huntington's Diseases	No
CC 74	Seizure Disorders and Convulsions	No
CC 75	Coma, Brain Compression/Anoxic Damage	Yes
CC 76	Mononeuropathy, Other Neurological Conditions/Injuries	No
CC 77	Respirator Dependence/Tracheostomy Status	Yes
CC 78	Respiratory Arrest	Yes
CC 79	Cardio-Respiratory Failure and Shock	Yes
CC 80	Congestive Heart Failure	Yes
CC 81	Acute Myocardial Infarction	Yes
CC 82	Unstable Angina and Other Acute Ischemic Heart Disease	Yes
CC 83	Angina Pectoris/Old Myocardial Infarction	No
CC 84	Coronary Atherosclerosis/Other Chronic Ischemic Heart Disease	No
CC 85	Heart Infection/Inflammation, Except Rheumatic	No
CC 86	Valvular and Rheumatic Heart Disease	No
CC 87	Major Congenital Cardiac/Circulatory Defect	No
CC 88	Other Congenital Heart/Circulatory Disease	No

CC #	Description	Potential Complication in Index Admission
CC 89	Hypertensive Heart and Renal Disease or Encephalopathy	No
CC 90	Hypertensive Heart Disease	No
CC 91	Hypertension	No
CC 92	Specified Heart Arrhythmias	Yes
CC 93	Other Heart Rhythm and Conduction Disorders	Yes
CC 94	Other and Unspecified Heart Disease	Yes
CC 95	Cerebral Hemorrhage	Yes
CC 96	Ischemic or Unspecified Stroke	Yes
CC 97	Precerebral Arterial Occlusion and Transient Cerebral Ischemia	Yes
CC 98	Cerebral Atherosclerosis and Aneurysm	No
CC 99	Cerebrovascular Disease, Unspecified	No
CC 100	Hemiplegia/Hemiparesis	Yes
CC 101	Diplegia (Upper), Monoplegia, and Other Paralytic Syndromes	Yes
CC 102	Speech, Language, Cognitive, Perceptual	Yes
CC 103	Cerebrovascular Disease Late Effects, Unspecified	
CC 104	Vascular Disease with Complications	Yes
CC 105	Vascular Disease	Yes
CC 106	Other Circulatory Disease	Yes
CC 107	Cystic Fibrosis	No
CC 108	Chronic Obstructive Pulmonary Disease	No
CC 109	Fibrosis of Lung and Other Chronic Lung Disorders	No
CC 110	Asthma	No
CC 111	Aspiration and Specified Bacterial Pneumonias	Yes
CC 112	Pneumococcal Pneumonia, Emphysema, Lung Abscess	Yes
CC 113	Viral and Unspecified Pneumonia, Pleurisy	No
CC 114	Pleural Effusion/Pneumothorax	Yes
CC 115	Other Lung Disorders	No
CC 116	Legally Blind	No
CC 117	Major Eye Infections/Inflammations	No
CC 118	Retinal Detachment	No
CC 119	Proliferative Diabetic Retinopathy and Vitreous Hemorrhage	No
CC 120	Diabetic and Other Vascular Retinopathies	No
CC 121	Retinal Disorders, Except Detachment and Vascular Retinopathies	No
CC 122	Glaucoma	No
CC 123	Cataract	No
CC 124	Other Eye Disorders	No
CC 125	Significant Ear, Nose, and Throat Disorders	No
CC 126	Hearing Loss	No
CC 127	Other Ear, Nose, Throat, and Mouth Disorders	No
CC 128	Kidney Transplant Status	No
CC 129	End Stage Renal Disease	Yes
CC 130	Dialysis Status	Yes
CC 131	Renal Failure	Yes
CC 132	Nephritis	Yes
CC 133	Urinary Obstruction and Retention	Yes
CC 134	Incontinence	No

CC #	Description	Potential Complication in Index Admission
CC 135	Urinary Tract Infection	Yes
CC 136	Other Urinary Tract Disorders	No
CC 137	Female Infertility	No
CC 138	Pelvic Inflammatory Disease and Other Specified Female Genital Disorders	No
CC 139	Other Female Genital Disorders	No
CC 140	Male Genital Disorders	No
CC 141	Ectopic Pregnancy	No
CC 142	Miscarriage/Abortion	No
CC 143	Completed Pregnancy With Major Complications	No
CC 144	Completed Pregnancy With Complications	No
CC 145	Completed Pregnancy Without Complication	No
CC 146	Uncompleted Pregnancy With Complications	No
CC 147	Uncompleted Pregnancy With No or Minor Complications	No
CC 148	Decubitus Ulcer of Skin	Yes
CC 149	Chronic Ulcer of Skin, Except Decubitus	No
CC 150	Extensive Third-Degree Burns	No
CC 151	Other Third-Degree and Extensive Burns	No
CC 152	Cellulitis, Local Skin Infection	Yes
CC 153	Other Dermatological Disorders	No
CC 154	Severe Head Injury	Yes
CC 155	Major Head Injury	Yes
CC 156	Concussion or Unspecified Head Injury	Yes
CC 157	Vertebral Fractures	No
CC 158	Hip Fracture/Dislocation	Yes
CC 159	Major Fracture, Except of Skull, Vertebrae, or Hip	Yes
CC 160	Internal Injuries	No
CC 161	Traumatic Amputation	No
CC 162	Other Injuries	No
CC 163	Poisonings and Allergic Reactions	Yes
CC 164	Major Complications of Medical Care and Trauma	No
CC 165	Other Complications of Medical Care	Yes
CC 166	Major Symptoms, Abnormalities	No
CC 167	Minor Symptoms, Signs, Findings	No
CC 168	Extremely Low Birth weight Neonates	No
CC 169	Very Low Birth weight Neonates	No
CC 170	Serious Perinatal Problem Affecting Newborn	No
CC 171	Other Perinatal Problems Affecting Newborn	No
CC 172	Normal, Single Birth	No
CC 173	Major Organ Transplant	No
CC 174	Major Organ Transplant Status	Yes
CC 175	Other Organ Transplant/Replacement	Yes
CC 176	Artificial Openings for Feeding or Elimination	Yes
CC 177	Amputation Status, Lower Limb/Amputation	Yes
CC 178	Amputation Status, Upper Limb	Yes
CC 179	Post-Surgical States/Aftercare/Elective	Yes
CC 180	Radiation Therapy	No

CC #	Description	Potential Complication in Index Admission
CC 181	Chemotherapy	No
CC 182	Rehabilitation	No
CC 183	Screening/Observation/Special Exams	No
CC 184	History of Disease	No
CC 185	Oxygen	No
CC 186	CPAP/IPPB/Nebulizers	No
CC 187	Patient Lifts, Power Operated Vehicles, Beds	No
CC 188	Wheelchairs, Commodes	No

Appendix B. ICD-9-CM Codes Included in Final Cohort

ICD-9-CM	Description
410.00	AMI (anterolateral wall) – episode-of-care unspecified
410.01	AMI (anterolateral wall) – initial episode-of-care
410.10	AMI (other anterior wall) – episode-of-care unspecified
410.11	AMI (other anterior wall) – initial episode-of-care
410.20	AMI (inferolateral wall) – episode-of-care unspecified
410.21	AMI (inferolateral wall) – initial episode-of-care
410.30	AMI (inferoposterior wall) – episode-of-care unspecified
410.31	AMI (inferoposterior wall) – initial episode-of-care
410.40	AMI (other inferior wall) – episode-of-care unspecified
410.41	AMI (other inferior wall) – initial episode-of-care
410.50	AMI (other lateral wall) – episode-of-care unspecified
410.51	AMI (other lateral wall) – initial episode-of-care
410.60	AMI (true posterior wall) – episode-of-care unspecified
410.61	AMI (true posterior wall) – initial episode-of-care
410.70	AMI (subendocardial) – episode-of-care unspecified
410.71	AMI (subendocardial) – initial episode-of-care
410.80	AMI (other specified site) – episode-of-care unspecified
410.81	AMI (other specified site) – initial episode-of-care
410.90	AMI (unspecified site) – episode-of-care unspecified
410.91	AMI (unspecified site) – initial episode-of-care

Appendix C. Updates to Measure Methodology

1. Updates to Measure Cohort

Inclusion of Maryland and US Territories Hospitals
During initial measure development the measure did not include AMI admissions from hospitals in Maryland or US Territories because CMS reimburses hospitals in Maryland and US Territories using a different mechanism than hospitals in the other 49 states and the District of Columbia. These hospitals are now included in the measure and treated as if they were paid under CMS's Inpatient Prospective Payment System (IPPS).

Exclusion of Hospice Patients
During initial measure development the AMI payment measure did not exclude patients in hospice due to a desire to include the full breadth of AMI index admissions that met our criteria. This decision was not aligned with CMS's publicly reported 30-day AMI RSMR measure. After discussion with our Technical Expert Panel, we decided to exclude patients with hospice enrollment within one year prior to or on the date of an index admission in order for the AMI payment and RSMR measure cohorts to be aligned as closely as possible. Consistent with CMS's 30-day AMI RSMR measure, we chose to retain patients with hospice assignments after the date of index admission because the hospice assignment may have been related to care received during the index AMI admission.

Effect on Cohort
The inclusion of admissions from hospitals in Maryland and US Territories and the exclusion of patients with hospice enrollment within one year prior to or on the date of an index admission resulted in an increase of 813 patients in the 2008 measure cohort.

2. Updated Results

The AMI payment measure was originally developed using 2008 Medicare administrative claims data. Since then, we subsequently refined the measure cohort as described above and added 2009 data.

We adjusted 2008 payment amounts to 2009 U.S. dollars using the four-quarter moving average percent changes in CMS market baskets for the period ending in the fourth quarter of calendar year 2009. (We used the four-quarter moving average percent changes in CMS market baskets for the period ending in the fourth quarter of calendar year 2010 to deflate January 2010 payments to 2009 dollars for patients with an index admission in December 2009). We used the Inpatient Rehabilitation and Inpatient Psychiatric Facilities Market Basket for all claims from inpatient rehabilitation and inpatient psychiatric facilities, the Long Term Care Hospital (LTCH) Market Basket for all claims from LTCHs, and the End-Stage Renal Disease Market Basket for all claims from renal dialysis facilities. Similarly, we used the Home Health Agency (HHA) Market Basket and the Skilled Nursing Facility (SNF) Market Basket for all claims we considered to be for HHA or SNF services respectively. We used the Medicare Economic Index for all claims we considered to be for physician services, and applied the Prospective Payment System Hospital Market Basket to all other claims.

We re-estimated payment ratios in the risk-adjustment model for 2008 and calculated analogous estimates for the 2009 and combined 2008-2009 cohorts. We also recalculated unadjusted patient level payments as well as unadjusted and risk-standardized payments for hospitals with 25 or more index admissions. For the combined 2008-2009 cohort the estimated between-hospital variance from the hierarchical generalized linear model was 0.011 (SE=0.0005). The AMI payment for a hospital with 1 standard deviation above average was 1.23 times that of a hospital with 1 standard deviation below average. Overall, the distributions of estimated payment ratios and unadjusted patient level payments were very similar across all cohorts.

Table C1. Patient-Level Unadjusted AMI Payment Distributions in 2009 Dollars

Summary Statistic	2008 Cohort 181,375 admits (2009 dollars)	2009 Cohort 169,555 admits (2009 dollars)	2008-2009 Cohort 350,930 admits (2009 dollars)
Min	$3,237	$3,161	$3,161
10th Percentile	$8,413	$8,155	$8,305
25th Percentile	$11,331	$11,531	$11,428
Median	$15,404	$15,923	$15,634
Mean (Std. Dev.)	$20,461 ($15,084)	$21,304 ($16,325)	$20,868 ($15,701)
75th Percentile	$24,300	$25,482	$24,885
90th Percentile	$38,971	$40,951	$39,907
Max	$286,441	$291,476	$291,476

Table C2. Hospital-Level Unadjusted and Risk-Standardized AMI Payment Distributions in 2009 Dollars

Summary Statistic	2008-2009 AMI Episode-of-Care Payment (Unadjusted)	2008-2009 AMI Episode-of-Care Payment (Risk Standardized)
Mean	$20,324	$21,125
SD	$2,961	$1,774
Min	$11,089	$13,909
10th Percentile	$16,617	$18,907
25th Percentile	$18,310	$19,920
Median	$20,288	$21,057
75th Percentile	$22,201	$22,300
90th Percentile	$23,961	$23,390
Max	$41,897	$28,979

Table C3. Payment Ratios for 2008, 2009, and Combined 2008-2009 AMI Payment Cohort

Risk Adjustment Category	Risk Adjustment Variable	2008 Payment Ratio	2009 Payment Ratio	2008-2009 Payment Ratio
Demographics	Age (65-74)	1.258	1.238	1.248
Demographics	Age (75-84)	1.212	1.210	1.211

Risk Adjustment Category	Risk Adjustment Variable	2008 Payment Ratio	2009 Payment Ratio	2008-2009 Payment Ratio
Demographics	Age (>=85) (reference group)	1.000	1.000	1.000
Cardiovascular	History of Percutaneous Coronary Intervention (PCI)	0.936	0.917	0.927
Cardiovascular	History of Coronary Artery Bypass Grafting (CABG)	0.810	0.796	0.803
Cardiovascular	Congestive Heart Failure (CC 80)	0.955	0.969	0.962
Cardiovascular	Angina Pectoris/Old Myocardial Infarction (CC 83)	0.960	0.957	0.958
Cardiovascular	Heart Infection/Inflammation, Except Rheumatic (CC 85)	1.225	1.242	1.234
Cardiovascular	Valvular and Rheumatic Heart Disease (CC 86)	1.028	1.024	1.025
Cardiovascular	Congenital Cardiac/Circulatory Defect (CC 87-88)	1.110	1.120	1.114
Cardiovascular	Hypertension and Hypertension Complications (CC 89-91)	0.952	0.941	0.947
Comorbid Conditions	Metastatic Cancer and Acute Leukemia and Other Major Cancers (CC 7-8)	0.909	0.898	0.903
Comorbid Conditions	Diabetes and Diabetes Complications (CC 15-19, 119-120)	1.048	1.057	1.053
Comorbid Conditions	Protein-Calorie Malnutrition (CC 21)	1.110	1.150	1.132
Comorbid Conditions	Other Significant Endocrine and Metabolic Disorders (CC 22)	1.049	1.043	1.047
Comorbid Conditions	Obesity/Disorders of Thyroid, Cholesterol, Lipids (CC 24)	0.938	0.917	0.929
Comorbid Conditions	Other Gastrointestinal Disorders (CC 36)	0.956	0.943	0.950
Comorbid Conditions	Osteoporosis and Other Bone/Cartilage Disorders (CC 41)	0.969	0.963	0.966
Comorbid Conditions	Iron Deficiency and Other/Unspecified Anemias and Blood Disease (CC 47)	1.057	1.080	1.069
Comorbid Conditions	Delirium and Encephalopathy (CC 48)	1.035	1.012	1.024
Comorbid Conditions	Dementia (CC 49)	0.894	0.894	0.894
Comorbid Conditions	Drug/Alcohol Psychosis (CC 51)	1.103	1.130	1.116
Comorbid Conditions	Drug/Alcohol Abuse/Dependence (CC 52-53)	0.930	0.925	0.928
Comorbid Conditions	Severe Mental Illness (CC 54-55)	1.030	1.059	1.044
Comorbid Conditions	Reactive and Unspecified Psychosis (CC 56)	0.958	0.968	0.963

Comorbid Conditions	Internal Injuries (CC 160)	1.161	1.141	1.151

3. Measure Reliability Testing

We calculated the Intraclass Correlation Coefficient (ICC) in order to assess the reliability of the measure. The ICC score can be used to determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance. We calculated the risk-standardized payment (RSP) using split-sample combined 2008-2009 data. Thus, we obtained two RSPs for each hospital, using an entirely distinct set of patients from the same time period. To the extent that the calculated measures of these two subsets agree, we have evidence that the measure assesses an attribute of the hospital, not of the patients. As a metric of agreement we calculated the ICC (2,1) as defined by Shrout and Fleiss (1979).[1]

The agreement between the two independent assessments of each hospital was 0.785, which, according to the conventional interpretation, is "substantial."[2]

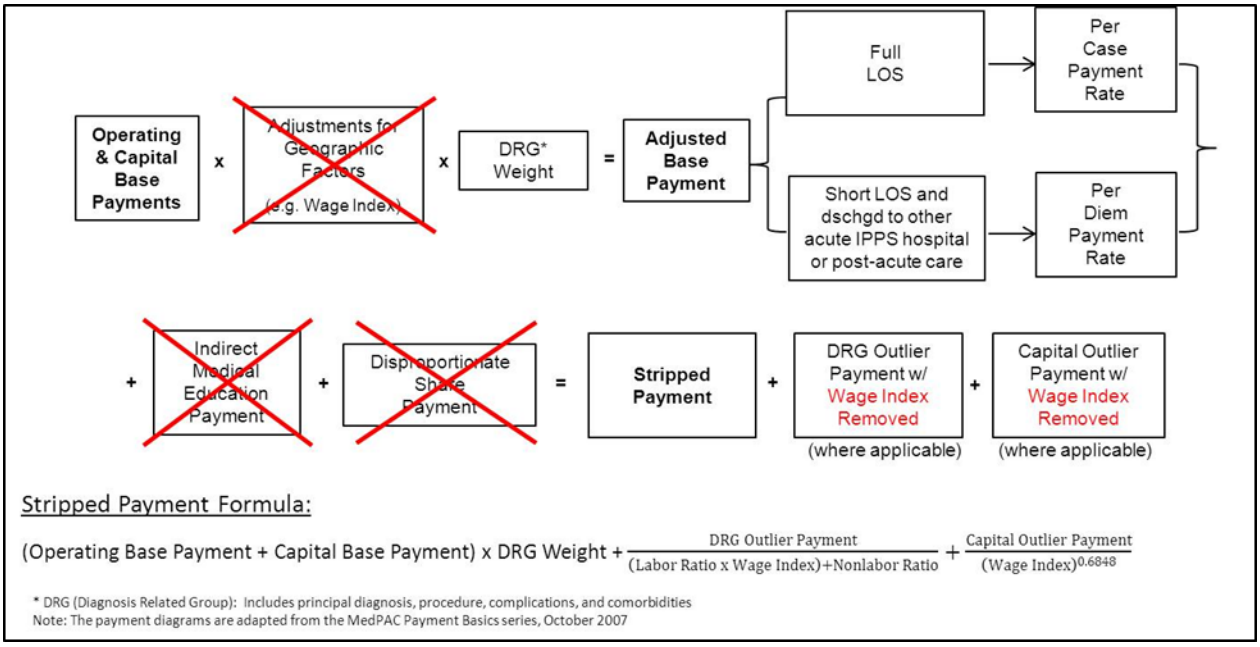
Appendix D. Example of Included and Excluded Payments for a Patient Admitted on May 3 and Discharged on May 8

Claim Type	Provider ID	Claim Date	Admission Type	Primary ICD-9	Payment	Included in Model?	Payment Included in Model	Comments
Carrier	123456	2 May-3 May	N/A	410.91	$255.61	N	$0.00	Starts prior to the index admission and ends within the analytic period.
Inpatient	234567	3 May-4 May	Admission	410.71	$1,109.49	Y	$1,109.49	This inpatient AMI (410.71) admission defines the index admission date (5/3).
Inpatient	345678	4 May-8 May	Transfer	410.71	$8,008.15	Y	$8,008.15	This inpatient AMI (410.71) discharge defines the discharge date (5/8).
Carrier	567891	3 May-3 May	N/A	785.0	$367.20	Y	$367.20	N/A
Carrier	678910	3 May-3 May	N/A	428.0	$6.59	Y	$6.59	N/A
Carrier	789101	3 May-8 May	N/A	410.71	$350.52	Y	$350.52	N/A
Carrier	456789	5 May-5 May	N/A	414.01	$225.75	Y	$225.75	N/A
Carrier	345678	7 May-7 May	N/A	296.30	$148.39	Y	$148.39	N/A
Inpatient	910112	30May -3 Jun	Readmission	410.71	$4,262.13	Y (prorated)	$3,409.70	Payment is prorated, based only on days in the 30-day post-admission period. The amount includes: ($4262.13/5)*4 = $3409.70. This second AMI (410.71) admission does not count as an index admission, but as a readmission.
Skilled Nursing Facility	891011	3Jun-21Jun	Transfer	428.0	$1,652.28	N	$0.00	Starts after the 30-day post-admission period.
N/A	N/A	N/A	N/A	TOTAL	$16,386.11	N/A	$13,625.79	N/A

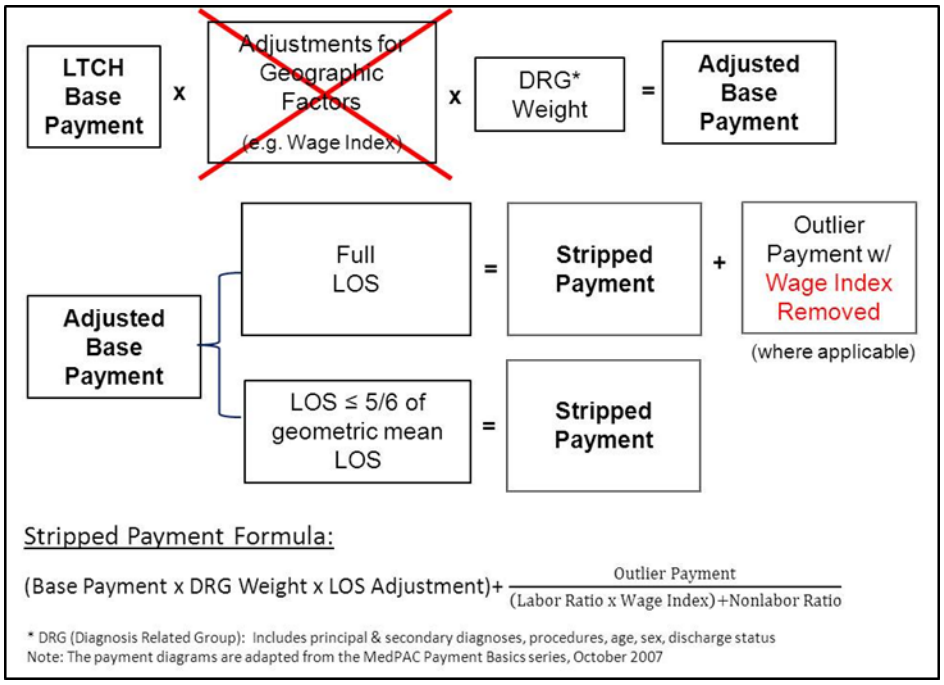
Appendix E. Stripped/Standardized Payment Diagrams

Inpatient Prospective Payment Setting: Stripped Payment

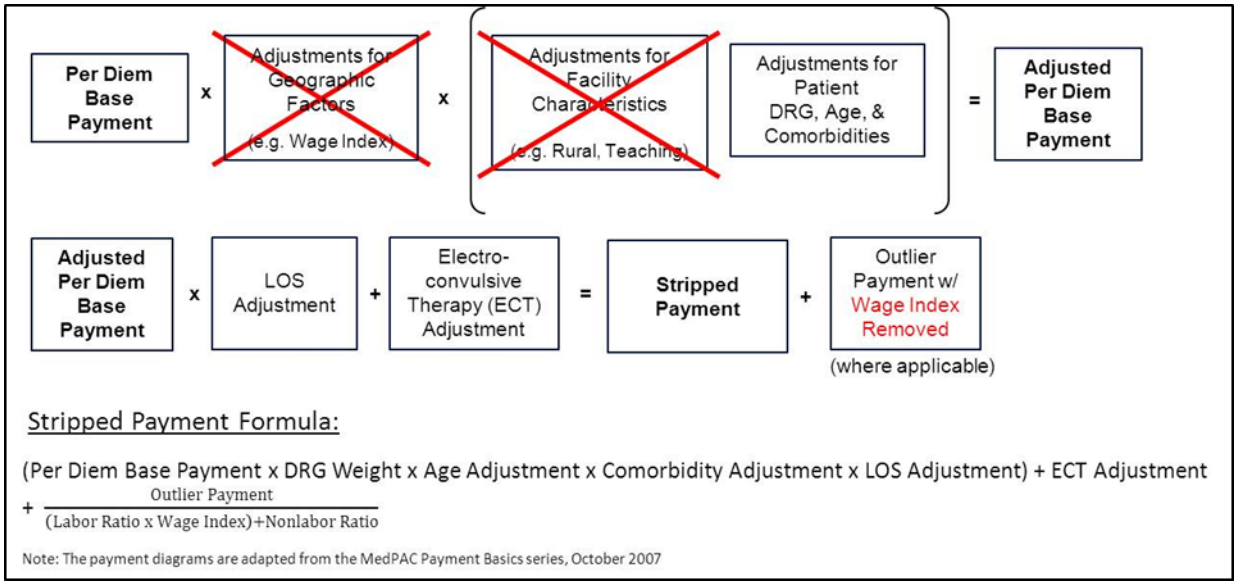


Note: Payments to critical access hospitals (CAHs) were calculated using the IPPS stripped payment formula.

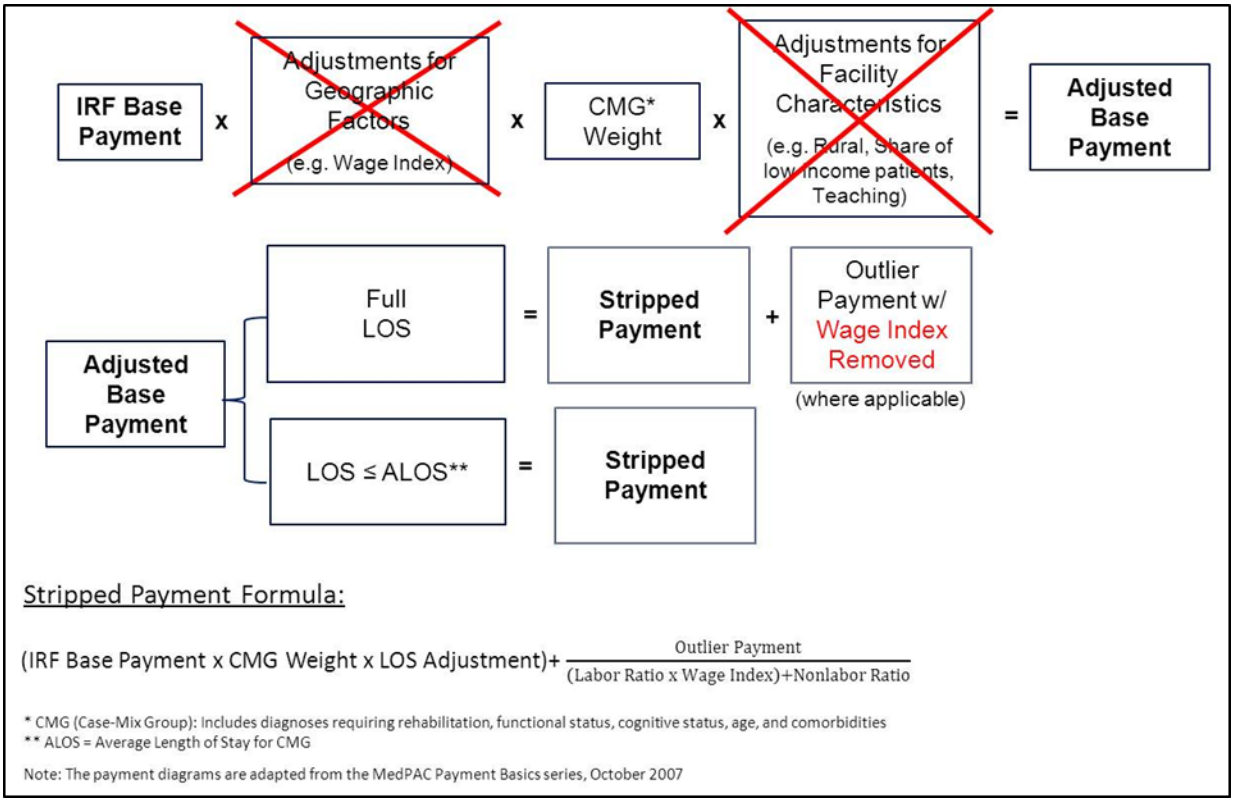
Long Term Care Hospitals: Stripped Payment



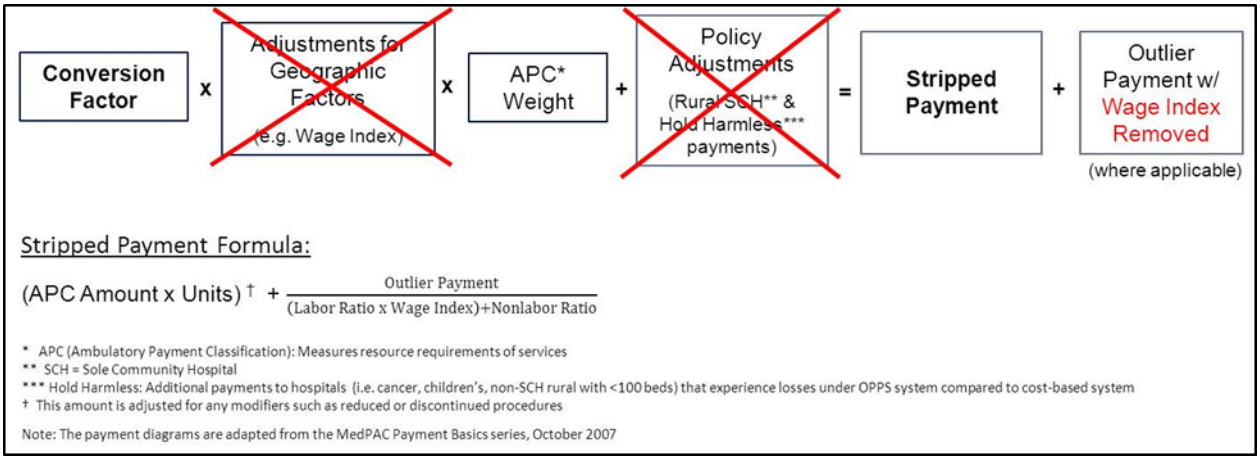
Inpatient Psychiatric Facility: Stripped Payment



Inpatient Rehabilitation Facility: Stripped Payment

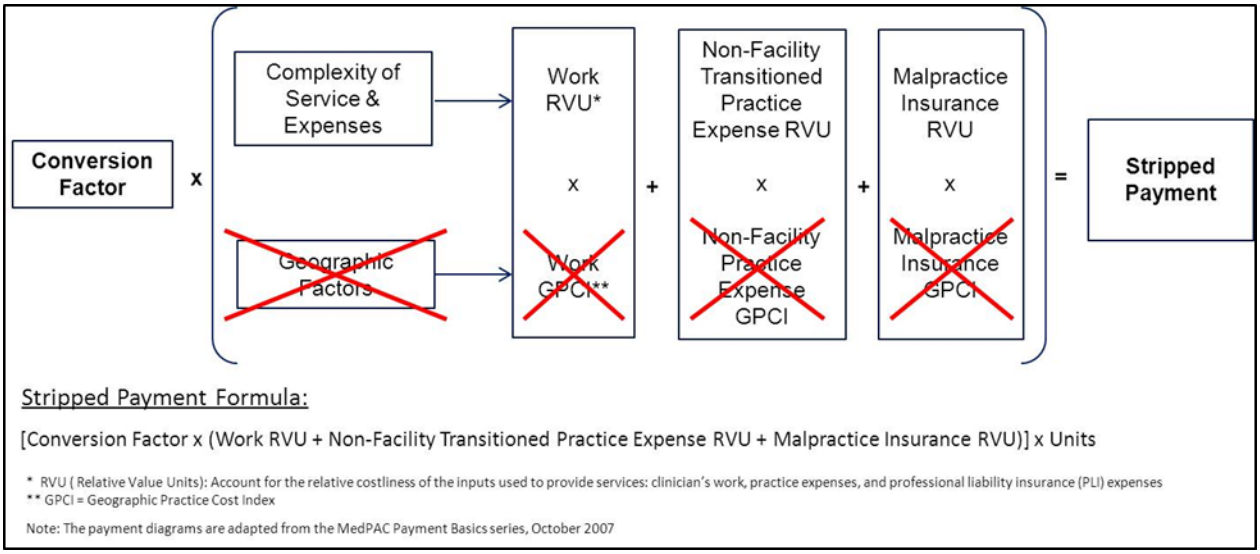


Hospital Outpatient and Community Mental Health Centers (CMHCs): Stripped Payment

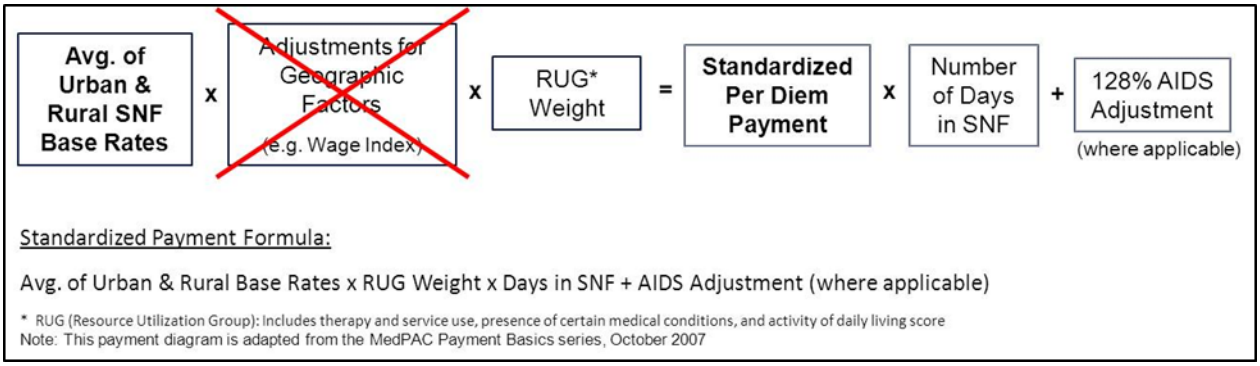


Note: Outpatient hospital claims can include services paid under the clinical lab, ambulance, physician, DME/POS/PEN, and Part B drugs fee schedules as well. Payments for those services are calculated according to the applicable payment formula.

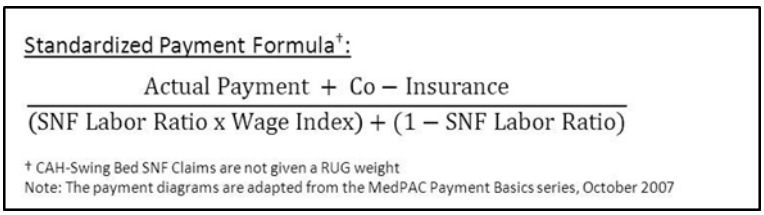
Comprehensive Outpatient Rehabilitation Facilities (CORFs) and Outpatient Rehabilitation Facilities (ORFs): Stripped Payment



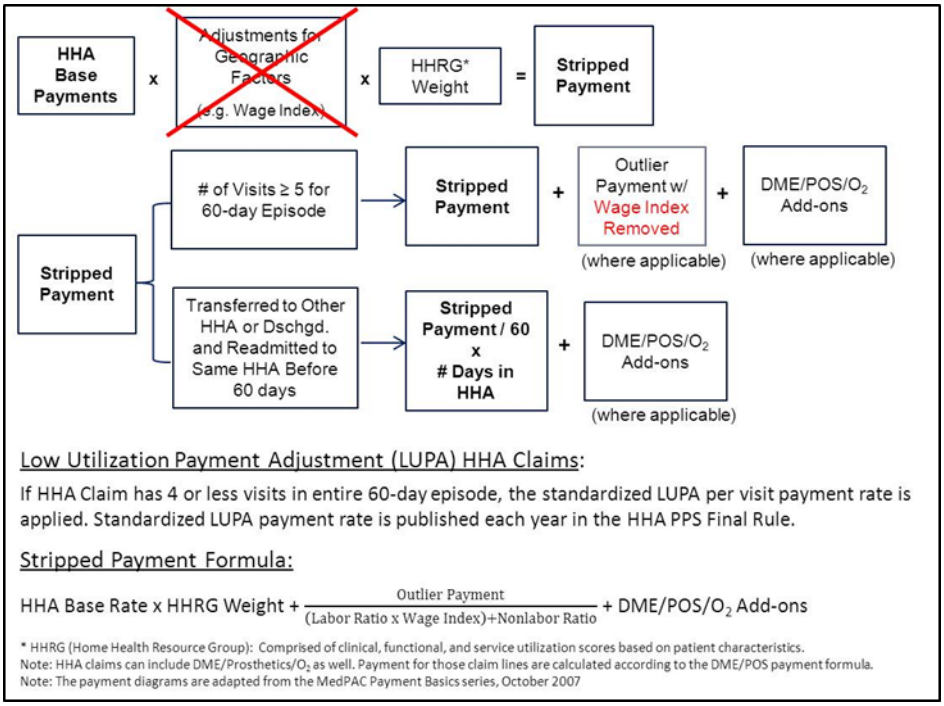
PPS SNF Claims: Standardized Payment



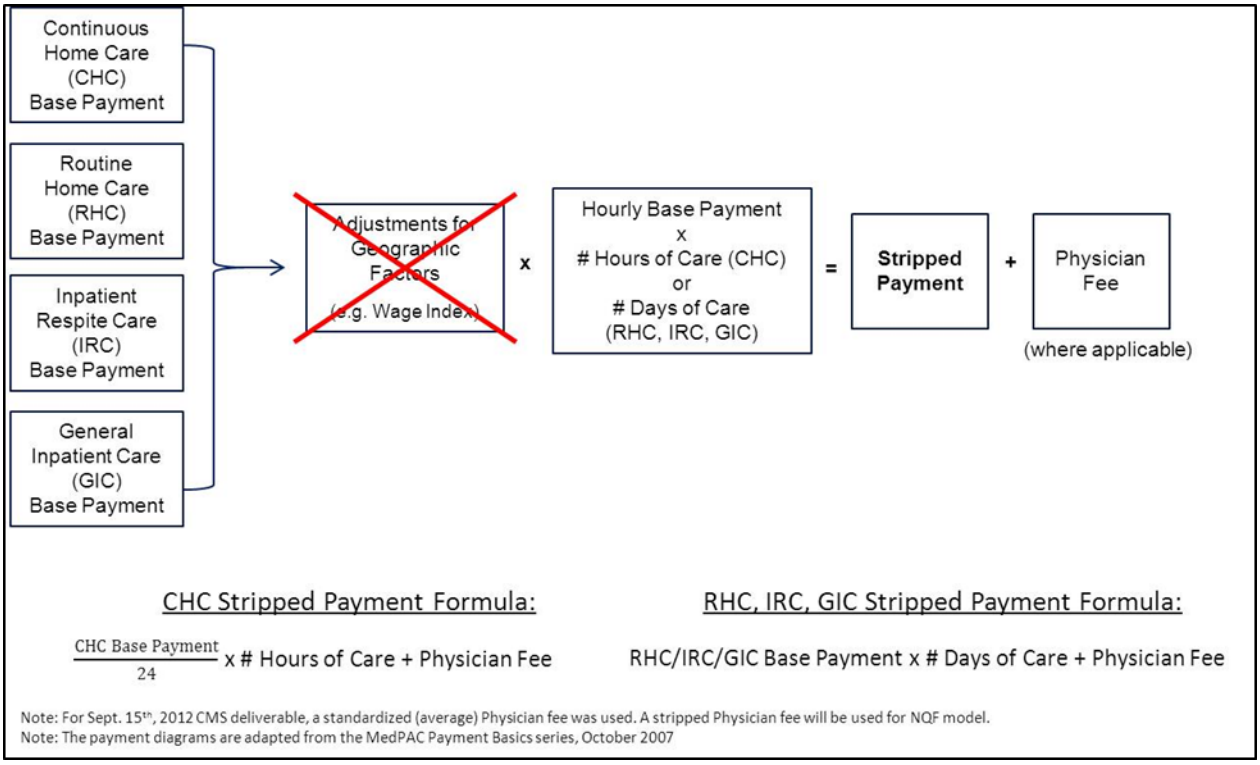
CAH Swing-Bed SNF Claims: Standardized Payment



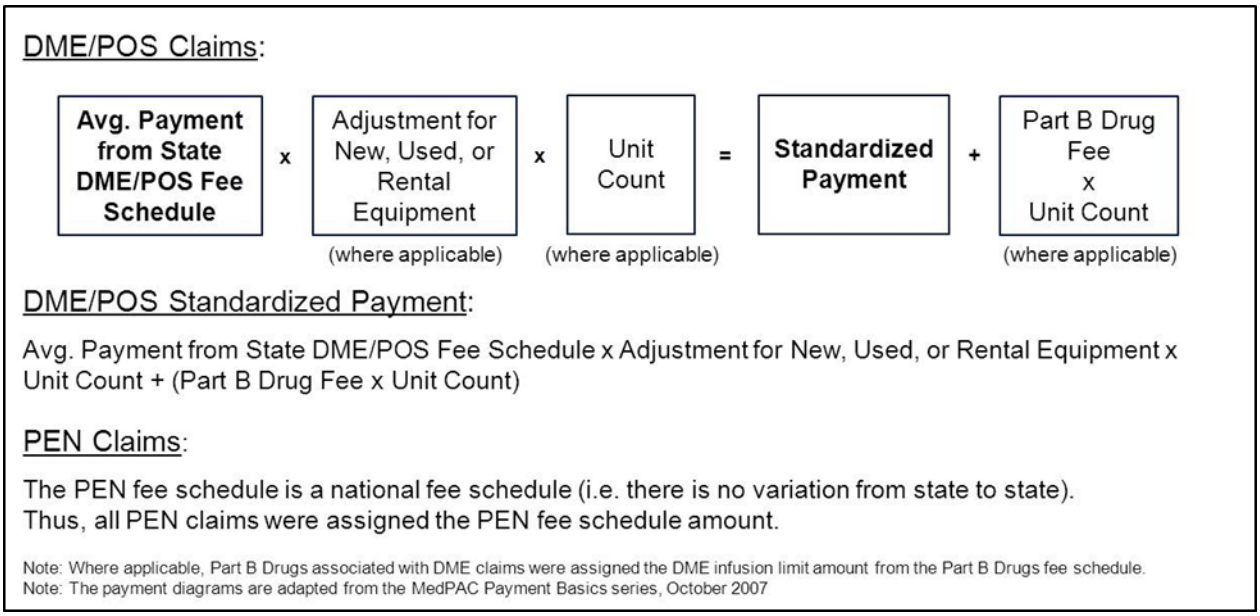
Home Health Agency (HHA): Stripped Payment



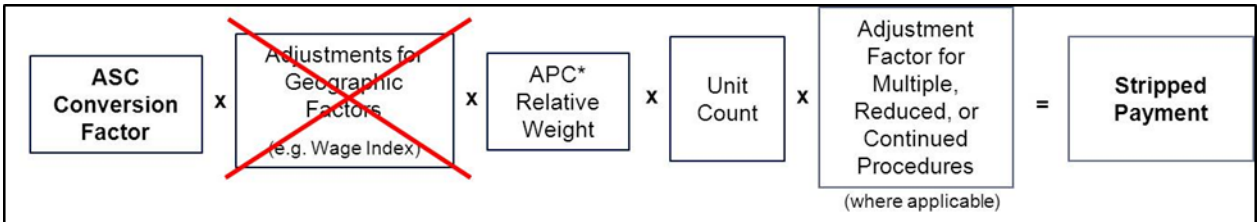
Hospice: Stripped Payment



Durable Medical Equipment (DME)/Prosthetics, Orthotics, and Surgical Supplies (POS)/Parenteral and Enteral Nutrition (PEN) Claims: Standardized Payment



Ambulatory Surgical Center (ASC): Stripped Payment



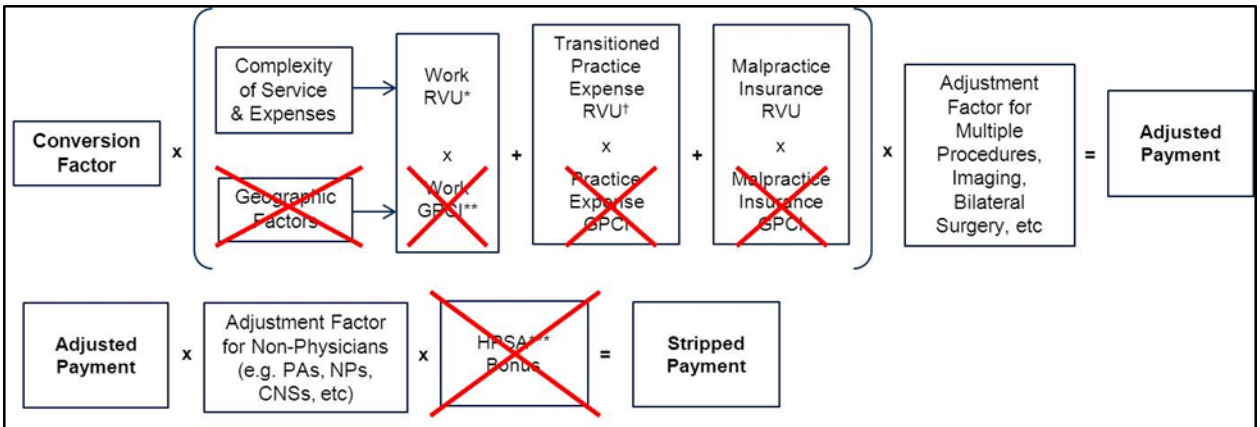
Stripped Payment Formula:

The amount equal to (ASC Conversion Factor x APC Relative Weight) is given on the ASC fee schedule.

(APC Fee Schedule Amount) x Unit Count x Adjustment Factor for Multiple, Reduced, or Continued Procedures

* APC = Ambulatory Payment Classification
Note: The payment diagrams are adapted from the MedPAC Payment Basics series, October 2007

Physician Services: Stripped Payment



Stripped Payment Formula:

[Conversion Factor x (Work RVU + Transitioned Practice Expense RVU + Malpractice Insurance RVU)] x Adjustment Factor Related to Procedures x Adjustment Factor for Non-Physicians x Units

* RVU (Relative Value Units): Account for the relative costliness of the inputs used to provide services: clinician's work, practice expenses, and professional liability insurance (PLI) expenses
** GPCI = Geographic Practice Cost Index
*** HPSA = Health Professional Shortage Area
† The physician fee schedule lists separate PE RVUs for facility and non-facility settings.

Note: The payment diagrams are adapted from the MedPAC Payment Basics series, October 2007

Clinical Labs: Standardized Payment

Avg. Payment from State Clinical Diagnostic Laboratory Fee Schedule	x	Unit Count	=	Standardized Payment

Standardized Payment Formula:

Avg. Payment from State Clinical Diagnostic Laboratory Fee Schedule x Unit Count

Labs Under the Automated Multi-Channel Chemistry Code (AMCC) Payment Algorithm Standardized Payment Formula:

Actual Payment + Co-insurance + Deductible

Part B Drugs: Standardized Payment

Part B Drugs National Fee Schedule Amount	x	Unit Count	=	Standardized Payment

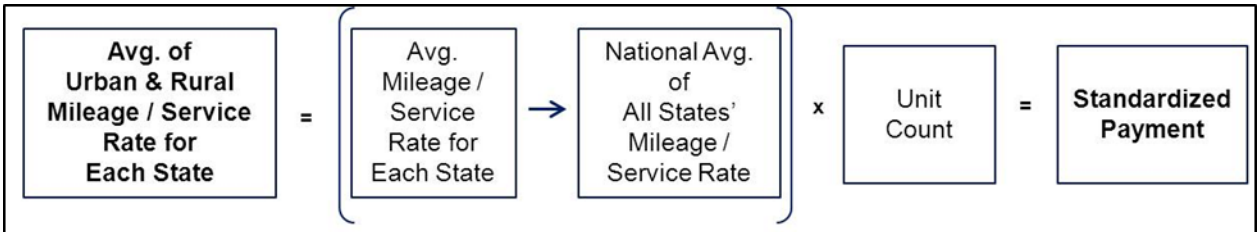
The Part B Drug fee schedule is a national fee schedule (i.e. there is no variation from state to state). Thus, all Part B Drug claims were assigned the national fee schedule amount.

Standardized Payment Formula:

Part B Drugs National Fee Schedule Amount x Unit Count

Note: Where applicable, Part B Drugs associated with DME claims were assigned the DME infusion limit amount from the Part B Drugs fee schedule.

Ambulance: Standardized Payment



Standardized Payment Formula:

Step 1:

$$\frac{\text{Urban+Rural Mileage / Service Rates}}{2} = \frac{\text{Average Mileage}}{\text{Service Rate for Each State}}$$

Step 2:

$$\frac{\sum\text{Avg.Mileage / Service Rate for Each State}}{\text{\# of States}} = \frac{\text{National Average Mileage}}{\text{Service Rate}}$$

Step 3:

$$\frac{\text{National Average Mileage}}{\text{Service Rate}} \times \text{Unit Count}$$

Rural Health Clinics (RHCs) and Federally Qualified Health Clinics (FQHCs): Standardized Payment

RHCs:

Each year Congress determines a RHC per visit payment limit. We remove the portion of the payment likely attributable to wages using the SNF state rural wage index.

Stripped Payment Formula:

$$\frac{\text{Actual Payment} + \text{Co} - \text{Insurance} + \text{Deductible}}{(\text{Outpatient Labor Ratio x Wage Index}) + (1 - \text{Outpatient Labor Ratio})}$$

FQHCs:

FQHC payments are an all-inclusive per visit amount based on reasonable costs. Given the resources necessary to determine whether the FQHC is located in a rural or urban area, we did not adjust for wages in the current data.

Standardized Payment Formula:

Actual Payment + Co-insurance

Note: A FQHC PPS is scheduled to be implemented in 2014.

Renal Dialysis Facilities (RDFs): Stripped Payment

Given that the 2008/2009 Renal Dialysis payment rates are adjusted by patient-specific body measurements which we do not have in our data, as well as capped at an amount equal to 3 dialysis sessions per week, we chose to remove the portion of the payment likely attributable to wages using the RDF wage index.

Stripped Payment Formula:

$$\frac{\text{Actual Payment} + \text{Co} - \text{Insurance} + \text{Deductible}}{(\text{Outpatient Labor Ratio x Wage Index}) + (1 - \text{Outpatient Labor Ratio})}$$

Note: A Renal Dialysis PPS was implemented in 2011.

Appendix F. Technical Expert Panel Member Roster

Name	Title	Organization	Area of Expertise
Amanda Kowalski, PhD	Assistant Professor of Economics	Yale University	Topic Knowledge
Anne-Marie Audet, MD, MSc, SM	Vice President, Health System Quality and Efficiency	Commonwealth Fund	Quality Improvement and Performance Measurement
David Dunn, MD	President-elect AAPC and Vice President of Zhealth Publishing	AAPC and Zhealth Publishing	Topic Knowledge
David S. P. Hopkins, PhD	Senior Advisor	Pacific Business Group on Health	Consumer, Quality Improvement, Performance Measurement
Donald Casey, MD, MPH, MBA	Vice President and Medical Director	NYU Langone Medical Center	Quality Improvement and Performance Measurement
Kavita Patel, MD, MS	Brookings Institution, Managing Director for Clinical Transformation and Delivery	Engelberg Center for Health Care Reform	Topic Knowledge
Lesley Curtis, PhD, MS	Associate Professor in Medicine	Duke University	Topic Knowledge and Performance Measurement
Peter Bach, MD, MAPP	Director, Center for Health Policy and Outcomes	Memorial Sloan-Kettering Cancer Center	Quality Improvement, Topic Knowledge, Health Care Disparities
Richard Bankowitz, MD, MBA	Chief Medical Officer	Premier Inc.	Quality Improvement, Topic Knowledge
Stephen Schmaltz, PhD, MS, MPH	Associate Director, Center for Database Management and Analysis	Joint Commission	Quality Improvement and Performance Measurement
Terry Golash, MD	Senior Medical Director	Aetna	Purchaser perspective
Vivian Ho, PhD	James A. Baker III Institute Chair in Health Economics and Professor of Economics	Rice University	Topic Knowledge
