Behavioral Health

DRAFT REPORT

Executive Summary

Access to quality behavioral healthcare is essential to leading a healthy, productive life. Yet mental illness and substance use disorders are leading causes of disability and premature mortality in the United States. Given that one in five American adults experience a mental illness in a given year, performance measurement in this area needs to remain current and operational.

This report is the fourth in a series of reports describing the National Quality Forum's (NQF) measure evaluation projects for behavioral health measures. The background and description of the project and overview of NQF's behavioral health portfolio are available on [NQF's project webpage](#). The multiphase project aims to endorse measures of accountability for improving the delivery of behavioral health services and achieving better behavioral health outcomes for the U.S. population. Phase four, detailed in this report, examines measures of tobacco use, alcohol and substance use, Attention Deficit Hyperactivity Disorder (ADHD), depression, medication continuation and reconciliation, and follow-up for after hospitalization for mental illness.

For this project, the Standing Committee evaluated seven newly submitted measures and six measures undergoing maintenance review against NQF's standard evaluation criteria. Eight measures were recommended for endorsement, four were not recommended, and one was deferred. The eight measures that were recommended by the Standing Committee are:

- 0027 Medical Assistance with Smoking and Tobacco Use Cessation (NCQA)
- 0576 Follow-Up After Hospitalization for Mental Illness (NCQA)
- 3132 Preventive Care & Screening: Screening for Clinical Depression and Follow-Up Plan (eMeasure) (CMS)
- 3148 Preventive Care & Screening: Screening for Clinical Depression and Follow-Up Plan (CMS)
- 3175 Continuity of Pharmacotherapy for Opioid Use Disorder (RAND Corporation)
- 3205 Medication Continuation Following Inpatient Psychiatric Discharge (Health Services Advisory Group, Inc.)
- 3185 Preventive Care & Screening: Tobacco Use: Screening & Cessation Intervention (eMeasure) (PCPI Foundation)
- 3225 Preventive Care & Screening: Tobacco Use: Screening & Cessation Intervention (PCPI Foundation)

The Committee did not recommend the following measures:

- 0108 Follow-Up Care for Children Prescribed ADHD Medication (NCQA)
- 3172 Continuity of Pharmacotherapy for Alcohol Use Disorder (RAND Corporation)
- 3207 Medication Reconciliation on Admission (Health Services Advisory Group, Inc.)

- 3229 Patient Panel Adult Smoking Prevalence (CMS)

The Committee deferred an endorsement decision on the following measure:

- 0008 Experience of Care and Health Outcomes (ECHO) Survey (AHRQ)

Brief summaries of the measures currently under review are included in the body of the report; detailed summaries of the Committee's discussion and ratings of the criteria for each measure are in [Appendix A](#).

Introduction

Behavioral healthcare refers to a continuum of services for individuals at risk of, or suffering from mental, behavioral, or addictive disorders ranging from mood and anxiety disorders to substance use disorders to post traumatic stress disorder. In the United States, it is estimated that approximately 43.8 million (18.5 percent) of the population experiences a mental illness in a given year.¹ In addition, 20.2 million U.S. adults experience a substance use disorder of which 50.5 percent had both a mental disorder and a substance use disorder, also known as a co-occurring disorder.²

Behavioral health continues to be a leading cause of disabilities that contribute to rising healthcare costs and costs employers billions of dollars each year. The U.S. national expenditure for mental health care in 2013 was \$201 billion and that number is expected to continue rising.³ Combining that number with updated projections of lost earnings and public disability insurance payments associated with mental illness, an estimate for the financial cost of mental disorders in the United States in 2012 was at least \$467 billion.⁴

However, while many of the illnesses and disorders that fall under the behavioral health umbrella are often chronic in nature, people can and do recover when provided with timely, high quality, coordinated, and evidence-based care. The treatment success rate for bipolar disorder and major depression is 80 percent while the treatment success rate for schizophrenia is 60 percent.⁵ Thus, ensuring that Americans have access to care can significantly affect the care trajectory. Properly screening and assessing populations at risk, regularly working on evaluating and managing illnesses, and ongoing care has the potential to change recovery trajectories over time. Improving quality measures and shifting towards a culture of measurement-based care enhances the quality and ultimately, the outcomes of behavioral health services.

NQF Portfolio of Performance Measures for Behavioral Health

The Behavioral Health Standing Committee (see [Appendix D](#)) oversees NQF's portfolio of behavioral health measures. Measures in this portfolio address tobacco, alcohol, and substance use; depression, major depressive disorder (MDD), schizophrenia, and bipolar disorders; health screening and assessment for those with serious mental illness; attention deficit hyperactivity disorder (ADHD); safe and appropriate inpatient psychiatric care; and follow up after hospitalization (see [Appendix B](#)). As shown in Table 1, these measures fit into the care trajectory and address populations at risk (phase 1), evaluation and initial diagnosis (phase 2), and follow-up care (phase 3). This portfolio contains 54 measures: 42 process measures, 11 outcome and resource use measures, and one structure measure (see table below).

Table 1. NQF Behavioral Health Portfolio of Measures

| | Process | Outcome/Resource Use | Structure |
|-----------------------------|---------|----------------------|-----------|
| Phase 1: Population at Risk | 10 | 0 | 1 |
| Spans between Phase 1 & 2 | 8 | 0 | 0 |

| | Process | Outcome/Resource Use | Structure |
|--|-----------|----------------------|-----------|
| Phase 2: Evaluation & Initial Management | 10 | 0 | 0 |
| Spans between Phase 2 & 3 | 2 | 0 | 0 |
| Phase 3: Follow-up Care | 12 | 11 | 0 |
| Total | 42 | 11 | 1 |

Additional measures related to behavioral health are assigned to other projects including Person and Family Centered Care, Pediatrics, Cardiovascular, and Neurology.

National Quality Strategy

NQF-endorsed measures for behavioral health support the [National Quality Strategy \(NQS\)](#). The NQS serves as the overarching framework for guiding and aligning public and private efforts across all levels (local, state, and national) to improve the quality of healthcare in the United States. The NQS establishes the "triple aim" of better care, affordable care, and healthy people/communities, focusing on six priorities to achieve those aims: *Safety, Person and Family Centered Care, Communication and Care Coordination, Effective Prevention and Treatment of Illness, Best Practices for Healthy Living, and Affordable Care.*

Quality measures for behavioral health align with several of the NQS priorities, including:

- **Making care safer by reducing harm caused in the delivery of care.** Poor medication adherence, which is common among patients with severe mental illness, leads to poor health outcomes and increased healthcare costs. Many barriers to adherence exist, including patient and family attitudes, treatment-related issues, health-system factors, cultural influences, and stigma. Ensuring that patients are adhering to their medications is an important role that providers must play in order to promote better health outcomes. Several measures in the behavioral health portfolio focus on medication adherence, continuation, and follow-up.
- **Promoting effective communication and coordination of care.** Effective communication among patients, families, and providers ensures that the needs and care preferences of the patient and family are recognized. Communication and coordination among providers is also important, as behavioral health spans across multiple providers and settings. Effective communication and coordination among these providers increases the likelihood of alignment between care preferences and care delivery.
- **Working with communities to promote wide use of best practices to enable healthy living.** Promoting healthy habits through better access to healthcare or by employing preventive healthcare measures is imperative to creating healthy communities. Early screening and detection can not only prevent illnesses, but can also identify them at earlier and more treatable stages. Several measures in the behavioral health portfolio focus on tobacco use screening and cessation, screening for clinical depression, and screening for alcohol use.

Use of Measures in the Portfolio

Endorsement of measures by NQF is valued not only because of the rigorous and transparent evaluation process, but also because evaluations are conducted by multi-stakeholder committees which comprise clinicians and other experts from the full range of healthcare providers, employers, health plans, public agencies, community coalitions, and patients—many of whom use measures on a daily basis. Moreover, NQF-endorsed measures undergo routine "maintenance" (i.e., re-evaluation) to ensure that they are still the best-available measures and reflect the current science. Importantly, federal law requires that preference be given to NQF-endorsed measures for use in federal public reporting and performance-based payment programs. NQF measures also are used by a variety of stakeholders in the private sector, including hospitals, health plans, and communities.

Many of the measures in the behavioral health portfolio are used in at least one federal program, such as the Medicare Shared Savings Program, Home Health Quality Reporting, Inpatient Psychiatric Hospital Quality Reporting, and the Physician Quality Reporting System. In addition, some of these measures have been used as part of state, regional, and community measurement initiatives. See [Appendix C](#) for details of federal program use for the measures in the portfolio.

Improving NQF's Behavioral Health Portfolio

Committee Input on Gaps in the Portfolio

Although the number of new measures submitted for endorsement has continued to grow, measure gaps remain in specific focus areas that individuals, families, and the broader healthcare community may value. During its discussions, the Committee identified numerous areas where additional measure development is needed, including:

- Outcome measures for psychotic disorders, including schizophrenia
- Overuse of prescribing opiates
- Setting-specific measures (e.g., jails)
- Proximal outcomes measures
- Measures specific to child and adolescent behavioral health needs
- Measures that encompass multiple settings to better assist in the push towards integrated behavioral health and physical health
- Measures that focus on substance use disorders in the primary care setting
- Composite measures that incorporate myriad mental illnesses (e.g., bipolar disorder, depression, and schizophrenia) rather than separate screening measures for each illness
- Patient-reported outcome measures
- Measures that examine the time period between screening and remission. For example, after screening a patient on their tobacco use, what percentage actually stopped smoking and what was the duration
- Measures that address access, or lack thereof, behavioral health facilities
- Measures that focus not only on treatment and prevention but also on recovery

Behavioral Health Measure Evaluation

On February 28-March 1, 2017 the Behavioral Health Standing Committee evaluated seven newly submitted measures and six measures undergoing maintenance review against [NQF's standard evaluation criteria](#). Additionally, the Committee agreed to defer an endorsement decision for one measure, Experience of Care and Health Outcomes (ECHO), and provided feedback to the developer to assist in future adjustments to the measure. NQF expects to review this measure for consideration of endorsement after the measure is updated as part of its annual review.

Table 2. Behavioral Health Measure Evaluation Summary

| | Maintenance | New | Total |
|--|--|--|-------|
| Measures under consideration | 6 | 7 | 13 |
| Measures recommended for endorsement | 2 | 6 | 8 |
| Measures not recommended for endorsement | 1 | 3 | 4 |
| Measure recommendation deferred | 1 | 0 | 1 |
| Reasons for not recommending | Importance - 0 Scientific Acceptability – 1 Overall – 0 Competing Measure - 0 | Importance – 2 Scientific Acceptability – 1 Overall – 0 Competing Measure - 0 | |

Comments Received Prior to Committee Evaluation

NQF solicits comments on endorsed measures on an ongoing basis through the [Quality Positioning System \(QPS\)](#). In addition, NQF solicits comments prior to the evaluation of the measures via an online tool located on the project webpage. For this evaluation cycle, the pre-evaluation comment period was open from February 2 - February 16, 2017 for all 13 of the measures under review. NQF received one pre-evaluation comment ([Appendix F](#)).

All submitted comments were provided to the Committee prior to its initial deliberations during the in-person meeting.

Overarching Issues

During the Committee's discussion of the measures, several overarching issues emerged that were factored into the Committee's ratings and recommendations for multiple measures and are not repeated in detail with each individual measure.

Potential Harms of Measurement

For maintenance measures, the Committee noted that they would like to know more about the potential harms of the measures before voting for continued endorsement. The Committee agreed that

a number of measures in the behavioral health portfolio expect the healthcare system to do more and it is typically assumed that these actions will not have any unintended consequences for the patient.

The Committee suggested that measure developers be required to include data on the measures' potential harms and burdens prior to coming back for maintenance review to ensure the measures do not place a large, unnecessary burden on providers.

eMeasure Numbering

When the developer of a previously endorsed, claims-based measure introduces an electronic-based version (eMeasure), the original measure is paired with the eMeasure and both are renumbered within NQF. For example, NQF #0028 Preventive Care and Screening: Tobacco Use: Screening & Cessation Intervention was a maintenance claims-based measure and the developer introduced a new, eMeasure version to be reviewed during this phase of work. When the eMeasure was submitted, the eMeasure was assigned as NQF #3185 and the claims-based version was renumbered to NQF #3225. The Committee noted that this renumbering is not intuitive and requires unnecessary work on the user side. For example, when a claims-based measure is assigned a new number, the user must retool their EHR, which leads to unexpected costs. The Committee recommended that rather than renumbering each time an eMeasure version is introduced, NQF should consider adding an 'e' to the end of original number to denote the eMeasure.

Measure Burden

The Institute for Healthcare Improvement (IHI) has talked about the need to simplify and reduce the total number of measures. The Committee noted there is a lot of discussion at NQF about measure harmonization, but that equal effort is needed to synthesize measures—to combine similar measures into a single measure. The Committee further expressed a desire to narrow the field to measures of proximal outcomes and potentially new types of measures such as measures that address access, or lack thereof, behavioral health facilities and measures that focus not only on treatment and prevention but also on recovery.

Developer Feedback

In part, the role of the Committee is to identify the current gaps and priority measurement areas in order to signal to measure developers where they should focus their efforts. The Committee discussed the economics of measure development and noted that by the time measures are submitted for endorsement there has been significant investment in developing the measure. The Committee expressed a desire to provide input to developers earlier in the measure development process. One Committee member noted that there are many instruments that are used standardly in the field that could yield proximal outcomes. However, developers are not submitting measures for endorsement because they do not believe they can pass NQF's rigid criteria. NQF staff also noted the availability of technical assistance for measure developers as well as the Measure Incubator— an NQF effort to convene the appropriate stakeholders to develop needed measures. The NQF Measure Incubator has already identified behavioral health as an area with significant gaps in measurement.

Summary of Measure Evaluation

The following brief summaries of the measure evaluation highlight the major issues that the Committee considered. Details of the Committee's discussion and ratings of the criteria for each measure are included in [Appendix A](#).

Recommended Measures

0027: Medical Assistance with Smoking and Tobacco Use Cessation (National Committee for Quality Assurance): Recommended

Description: The three components of this measure assess different facets of providing medical assistance with smoking and tobacco use cessation: (1) Advising Smokers and Tobacco Users to Quit: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who received advice to quit during the measurement year. (2) Discussing Cessation Medications: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were recommended cessation medications during the measurement year. (3) Discussing Cessation Strategies: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were provided cessation methods or strategies during the measurement year; **Measure Type:** Process; **Level of Analysis:** Health Plan, Integrated Delivery System; **Setting of Care:** Clinician office/Clinic setting; **Data Source:** Patient-reported data (CAHPS Health Plan Survey 5.0H, Adult Version; Medicare CAHPS)

Tobacco smoking is the leading cause of preventable disease and death in the United States, resulting in approximately 480,000 premature deaths and more than \$300 billion in direct health care expenditures and productivity losses each year.⁶ Studies show that physician or nurse's advice increases smoking cessation compared to no advice or usual care. This health plan level process measure, initially endorsed in 2009 and most recently endorsed in 2012, is a long-standing measure that uses patient-reported data from the CAHPS survey to assess if patients have received assistance from a doctor or health care provider to stop smoking and tobacco use. The Committee agreed that based on the performance data provided by the developer, a gap in care continues to exist for advising patients to quit smoking, discussing cessation medications, and discussing cessation strategies. The Committee expressed concern around recall bias and ensuring that the questions in the CAHPS survey are clearly defined and for recall bias, since these are patient-reported data. This measure is currently used in several programs including the Medicaid Adult Core Set and in NCQA's accreditation of health care plans. Ultimately, the Committee recommended this measure for endorsement.

0576: Follow-Up After Hospitalization for Mental Illness (National Committee for Quality Assurance): Recommended

Description: The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are reported:

- The percentage of discharges for which the patient received follow-up within 30 days of discharge
- The percentage of discharges for which the patient received follow-up within 7 days of discharge;

Measure Type: Process; **Level of Analysis:** Health Plan, Integrated Delivery System; **Setting of Care:** Behavioral Health: Inpatient, Behavioral Health: Outpatient, Clinician Office/Clinic; **Data Source:** Claims (Only)

Evidence suggests that brief, low-intensity case management interventions are effective in bridging the gap between inpatient and outpatient treatment for mental illnesses.⁷ Low-intensity interventions are typically implemented at periods of high risk for treatment dropout, such as following an emergency room or hospital discharge or the time of entry into outpatient treatment.⁸ This health plan level process measure, originally endorsed in 2009 and most recently endorsed in 2012, assesses whether health plan members who were hospitalized for a mental illness received a timely follow-up visit. The developer provided several updated clinical guidelines supporting follow-up after hospitalization and cited evidence that follow-up reduces suicide attempts and readmissions and improves functioning. Variability in performance exists among health plans, and there are statistically significant differences in the rates among various racial and ethnic groups. The Committee had several suggestions for revising the measure in the future including to be able to use telehealth to count for follow-up visits, to remove the same-day visit, to consider expanding the definition of ‘mental health practitioner,’ and to add hospitalizations for drug and alcohol disorders. This measure is used in several programs including the Medicaid Child Core Set and in NCQA’s accreditation of health care plans. The Committee recommended this measure for endorsement.

3132: Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan (eMeasure) (Quality Insights of Pennsylvania): Recommended

Description: Percentage of patients aged 12 years and older screened for depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen; **Measure Type:** Process; **Level of Analysis:** Clinician: Group/Practice, Clinician: Individual; **Setting of Care:** Clinician Office/Clinic; **Data Source:** Electronic Health Record (Only)

The World Health Organization describes major depression as the leading cause of disability worldwide. In 2014, 11.7 percent of adolescents aged 12 to 17 and 6.6 percent of adults 18 years and older in the United States received a diagnosis of major depressive disorder.⁹ The U.S. Preventive Services Task Force (USPSTF) guidelines recommend routine screening for depression as a part of primary care for both children and adults, seeking to increase detection and treatment of depression and reduce the associated economic burden. This newly proposed process measure is the eMeasure version of NQF #3148 (formerly #0418) and assesses whether clinicians are screening patients for depression and are developing a follow-up plan if the screen is positive. As the evidence presented was the same as for NQF #3148, the rating for evidence was automatically assigned to this eMeasure without discussion. Data elements of the eMeasure were found to be compliant with industry standards. The measure score was assessed for reliability using EHR data from two practices and for validity with Bonnie testing on 22 test cases as well as a technical expert panel of 12 clinicians. The Committee noted concerns about particular exclusions (e.g., patient refusal) and the challenges in documenting follow-up plans, but the developer noted that these exclusions do not occur frequently. The Committee recommended this measure for endorsement.

3148: Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan (Quality Insights of Pennsylvania): Recommended

Description: Percentage of patients aged 12 years and older screened for clinical depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a

follow-up plan is documented on the date of the positive screen.; **Measure Type:** Process; **Level of Analysis:** Clinician: Group/Practice, Clinician: Individual; **Setting of Care:** Clinician Office/Clinic; **Data Source:** Claims (Only), Registry

The World Health Organization describes major depression as the leading cause of disability worldwide. In 2014, 11.7 percent of adolescents aged 12 to 17 and 6.6 percent of adults 18 years and older in the United States received a diagnosis of major depressive disorder. The USPSTF guidelines recommend routine screening for depression as a part of primary care for both children and adults, seeking to increase detection and treatment of depression and reduce the associated economic burden. This claims/registry-based process measure (formerly NQF #0418), originally endorsed in 2008 and most recently endorsed in 2014, assesses whether clinicians are screening patients for depression and are developing a follow-up plan if the screen is positive. USPSTF and ICSI guidelines have been updated, but are directionally the same as in the last review. Performance rates continue to show a significant gap among providers, and the literature indicates lower rates of screening and treatment in minority adults. The Committee attributed a decline in performance rates over the last few years to the increase in the number of providers reporting on the measure; the Committee agreed that this is a typical phenomenon as early reporters are usually higher performers, and the lower rates may show the true opportunity for improvement. Several individual Committee members expressed concerns about particular exclusions (e.g., patient refusal), but the developer noted these exclusions do not occur frequently. The data elements are routinely collected in electronic sources and there have been no reported implementation challenges, although one committee member expressed concern regarding the difficulty of documenting the follow-up plan. The measure is used in various CMS programs, including the Medicaid Adult Core Set. The Committee recommended this measure for endorsement.

3175: Continuity of Pharmacotherapy for Opioid Use Disorder (RAND Corporation): Recommended

Description: Percentage of adults 18-64 years of age with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment; **Measure Type:** Process; **Level of Analysis:** Health Plan, Population: Regional and State; **Setting of Care:** Behavioral Health: Outpatient, Clinician Office/Clinic; **Data Source:** Claims (Other), Pharmacy

According to the 2014 National Survey on Drug Use and Health (NSDUH), 1.7 million adults 18 years and older were classified as having a pain reliever use disorder and 886,000 adults had used heroin in the past year. In 2014, there were 489,532 episodes of treatment for Opioid Use Disorder (OUD), including outpatient treatment, detoxification, and residential treatment. Medication-assisted treatment (i.e., pharmacotherapy combined with counseling) is an evidence-based and effective treatment option for patients with OUD and this newly proposed process measure focuses on continuity of pharmacotherapy, defined as treatment duration of at least 180 days and absence of treatment gaps of greater than 7 days. In particular, the measure is based on the evidence showing the increased mortality associated with interruption of medication, with highest risks being in the first few weeks after stopping the medication. The mean performance rate in 2014-2015 was 27.7 percent. The Committee had extensive discussions about the measure specifications. They expressed concern about the measure capturing individuals who are appropriately discontinuing medication, as the measure cannot tell which patients have been on medication for years. Given concerns for capturing individuals who are appropriately

stopping medications, the Committee strongly recommended that this measure not be used in pay-for-performance programs initially. They also recommended expansion of the patient pool, stratification of data for patients who have just initiated treatment versus those who have been on the medication for a long time, and the addition of a counseling component. Ultimately, the Committee recommended this measure for endorsement.

3205: Medication Continuation Following Inpatient Psychiatric Discharge (Health Services Advisory Group, Inc.): Recommended

Description: This measure assesses whether psychiatric patients admitted to an inpatient psychiatric facility (IPF) for major depressive disorder (MDD), schizophrenia, or bipolar disorder filled a prescription for evidence-based medication within 2 days prior to discharge and 30 days post-discharge. The performance period for the measure is two years; **Measure Type:** Process; **Level of Analysis:** Facility; **Setting of Care:** Behavioral Health: Inpatient; **Data Source:** Claims (Only)

Medication continuation is particularly important in the psychiatric patient population because psychotropic medication discontinuation can have a range of adverse effects, from mild withdrawal to life-threatening autonomic instability and psychiatric decompensation.¹⁰ The aim of this process measure is to assess whether psychiatric patients admitted to an inpatient psychiatric facility (IPF) for major depressive disorder (MDD), schizophrenia, or bipolar disorder filled a prescription for evidence-based medication within 2 days prior to discharge and 30 days post-discharge. Evidence demonstrates that interruption of medication leads to relapse and negative outcomes. The Committee noted that the overall distribution of performance on the measure was somewhat high (66.7 percent in the 10th percentile), but agreed that the specifications likely limited the patient pool to those without access challenges. The Committee raised concerns for hospitals being held responsible for patients filling their prescriptions, but they noted that this may drive hospitals to use outpatient pharmacies and also ensure proper education on the importance of taking the medication. For the future, the Committee recommended the developer expand the measure denominator to include Medicare Advantage and/or other patients. Ultimately, the Committee recommended this measure for endorsement.

3185: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention (eMeasure) (PCPI Foundation): Recommended

Description: Percentage of patients aged 18 years and older who were screened for tobacco use, one or more times within 24 months, AND who received cessation intervention, if identified as a tobacco user; **Measure Type:** Process; **Level of Analysis:** Clinician: Group/Practice, Clinician: Individual; **Setting of Care:** Behavioral Health: Outpatient, Clinician Office/Clinic, Home Health, Other; **Data Source:** Electronic Health Record (Only)

Tobacco screening and brief cessation intervention (including counseling and/or pharmacotherapy) is successful in helping tobacco users quit. Tobacco users who are able to stop smoking lower their risk for heart disease, lung disease, and stroke. This newly proposed process measure is the eMeasure version of NQF #3225 (formerly #0028) and it intends to promote adult tobacco screening and tobacco cessation interventions for those who use tobacco products. As the evidence presented was the same as for NQF #3225, the rating for evidence was automatically assigned to this eMeasure without discussion. Data

elements of the eMeasure were found to be compliant with industry standards. The measure score was assessed for reliability using 2015 data reported via the EHR option to the PQRS program and for validity with Bonnie testing on 40 test cases as well as a technical expert panel of 10 clinicians. The Committee noted concerns about particular exclusions (e.g., medical reasons for not screening). Ultimately, the Committee recommended this measure for endorsement.

3225: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention (PCPI Foundation): Recommended

Description: Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation intervention if identified as a tobacco user;

Measure Type: Process; **Level of Analysis:** Claims (Only), Claims (Other), Registry; **Setting of Care:** Behavioral Health: Outpatient, Clinician Office/Clinic, Home Health, Other; **Data Source:** Claims (Only), Claims (Other), Registry

Tobacco screening and brief cessation intervention (including counseling and/or pharmacotherapy) is successful in helping tobacco users quit. Tobacco users who are able to stop smoking lower their risk for heart disease, lung disease, and stroke. This process measure, first endorsed in 2009 and most recently in 2012, assesses is intended to promote adult tobacco screening and tobacco cessation interventions for those who use tobacco products. USPSTF and U.S. Public Health Service guidelines have been updated, but are directionally the same as in the last review. The Committee agreed that the high rates of performance are likely due to high performers choosing this measure to report on, noting literature that suggests performance is likely lower in the broader provider population. The literature also demonstrates that rates of tobacco screening and intervention vary by race, age, and insurance status, so the Committee agreed this was still important to measure. The Committee discussed expanding the measure to include the adolescent population as well as other forms of nicotine delivery (e.g., electronic cigarettes). The Committee also expressed concern for allowing exclusions for “medical reasons” and a desire to see the measure stratified for patients with mental health and substance use disorders. This measure is used in several programs including PQRS and Physician Compare. Ultimately, the Committee recommended the measure for endorsement.

Measures Not Recommended

0108: Follow-Up Care for Children Prescribed ADHD Medication (National Committee for Quality Assurance): Not Recommended

Description: Percentage of children newly prescribed attention-deficit/hyperactivity disorder (ADHD) medication who had at least three follow-up care visits within a 10-month period, one of which is within 30 days of when the first ADHD medication was dispensed. An Initiation Phase Rate and Continuation and Maintenance Phase Rate are reported; **Measure Type:** Process; **Level of Analysis:** Health Plan, Integrated Delivery System; **Setting of Care:** Clinician Office/Clinic; **Data Source:** Claims (Only), Pharmacy

Attention-deficit/hyperactivity disorder (ADHD) is a brain disorder marked by an ongoing pattern of inattention and/or hyperactivity-impulsivity that interferes with functioning or development.

Medications can improve function, but proper monitoring is recommended. The intent of this measure is to ensure timely and continuous follow-up visits for children who are newly prescribed ADHD medication. This process measure, originally endorsed in 2009 and most recently in 2015, encourages the monitoring of children for medication effectiveness, occurrence of side effects and adherence. The Committee did not reach consensus on the subcriterion of evidence, mainly due to the lack of evidence for a follow-up visit within 30 days (initiation rate). While the Committee agreed there is a persistent gap in performance on this measure, they also recognized that the performance rate continues to show little change over the years. The Committee found the measure to be reliable based on score-level testing. However, the Committee did not pass the measure on the subcriterion of validity, largely based on the lack of evidence for the specification of the initiation rate as well as the inability for providers to engage with patients in ways other than an in-person, face-to-face visit for the initial visit. The Committee stated that in this way, the measure has not kept pace with the changing practice patterns. Therefore, the measure did not pass the validity subcriterion and the Committee did not recommend this measure for endorsement.

3172: Continuity of Pharmacotherapy for Alcohol Use Disorder (RAND Corporation): Not Recommended

Description: Percentage of adults 18-64 years of age with pharmacotherapy for alcohol use disorder (AUD) who have at least 180 days of treatment and a Proportion of Days Covered (PDC) of at least 0.8; **Measure Type:** Process; **Level of Analysis:** Health Plan, Population : Regional and State; **Setting of Care:** Clinician Office/Clinic, Behavioral Health : Outpatient; **Data Source:** Claims (Other), Pharmacy

According to the 2014 National Survey on Drug Use and Health (NSDUH), 16.3 million Americans ages 18 years and older suffered from Alcohol Use Disorder (AUD), representing almost 7 percent of the adult population. However, only 15.2 percent of patients, who reported that they needed alcohol treatment, actually received it. Medication-assisted treatment (i.e., pharmacotherapy combined with counseling) is an evidence-based and effective treatment option for patients with AUD. This newly proposed process measure focuses on continuity of pharmacotherapy, defined as treatment duration of at least 180 days and sufficient adherence for the duration of treatment. The definition of adherence follows the established convention of having access to medication for at least 80 percent of treatment days. The Committee regarded the evidence on the individual medications to be of varied strength and quality, stating that some of the individual medications had little evidence to support the timeframe of the measure or even the efficacy of the medication itself. The Committee was particularly concerned that the medications are used to reduce the number of days of alcohol use, but as opposed to medications used for OUD, relapses are not specifically associated with discontinuation of AUD medications. The Committee expressed further concern that the Food and Drug Administration to not approve some of the included medications for AUD; in addition, some of the medications have other uses (e.g., gabapentin for neuropathy) and so appropriate discontinuation of these medications would be captured in the measure. The Committee noted that cognitive-behavioral therapies can be equally effective in treating AUD. Overall; the Committee concluded that the evidence for using medication alone for AUD is not strong, and therefore questioned the importance of measuring medication use in isolation from cognitive-behavioral therapies. The measure did not pass the evidence subcriterion and the Committee did not recommend this measure for endorsement.

3207: Medication Reconciliation on Admission (Health Services Advisory Group, Inc.): Not Recommended

Description: The average completeness of the medication reconciliation process within 48 hours of admission to an inpatient facility; **Measure Type:** Composite; **Level of Analysis:** Facility; **Setting of Care:** Behavioral Health : Inpatient; **Data Source:** Other, Paper Records

According to a 2015 study by the Agency for Healthcare Research and Quality (AHRQ), more than half of admitted patients' medication lists contain at least one discrepancy and 40 percent of these identified discrepancies have the potential to cause harm. These errors in prescription medication history's most commonly occur during the admission process. This newly proposed composite measure has three components for the process of medication reconciliation on admission, each of which has between one and five scoring elements. The Committee expressed concern that the evidence was weak for the measure focus, noting that in the systematic review cited, only six of the 26 studies were rated as good quality, and the review did not distinguish when the reconciliation occurred. The Committee also noted that while national organizations may say medication reconciliation is important, they do not see clear evidence that specifically links each of the components of the measure with enhanced outcomes. The developer stated the measure is consistent with best practices of the Joint Commission, but the Committee noted these are not evidenced based recommendations. The measure did not pass the evidence subcriterion and the Committee did not recommend this measure for endorsement.

3229: Patient Panel Adult Smoking Prevalence (Centers for Medicare & Medicaid Services): Not Recommended

Description: Percentage of adults (age 18 years or older) who are tobacco smokers at time of most recent encounter during the measurement period; **Measure Type:** Outcome; **Level of Analysis:** Clinician : Individual; **Setting of Care:** Clinician Office/Clinic, Other, Behavioral Health : Outpatient; **Data Source:** Electronic Health Record (Only)

Despite declines in use, tobacco consumption, and cigarette smoking in particular, remains the single most preventable cause of disease and death in the United States. As of 2015, an estimated 36.5 million (15.1 percent) of adults endorsed cigarette smoking. This newly proposed intermediate outcome measure looks at the percentage of adults who are tobacco smokers to emphasize the outcome rather than the process. The evidence demonstrates that there are interventions that can impact the desired outcome (decreased smoking rates). The developer showed variation in that provider-level prevalence rates of smoking range from 0.0 percent to 69.2 percent, with a mean rate of 13.2 percent. The Committee noted high reliability in testing, but expressed concern for a provider's ability to "game" the measure. The measure excludes all patients who do not have a smoking status recorded; this resulted in 26.5 percent of patients being excluded during testing, which the Committee noted could impact the validity of the results. The Committee had other concerns including attributing failure of a patient to quit smoking to a provider who is actively working with a patient who has relapsed, as well as attributing failure to a provider who is seeing a patient for the first time. The Committee expressed their support for this type of measure, noting it was an important first step in moving towards outcomes; however, they suggested several considerations for the developer including reconfiguring the measure to be based on the percent change in smoking, combining the measure with a screening measure, and

ensuring patients are attributed to providers who have seen them continuously. The measure did not pass the validity subcriterion and the Committee did not recommend this measure for endorsement.

Measures with Endorsement Decision Deferred

0008: Experience of Care and Health Outcomes (ECHO) Survey: Endorsement Decision Deferred

Description: The ECHO is a survey that includes 5 multiple item measures and 12 single item measures:

Multiple Item Measures:

Getting treatment quickly

-Get treatment as soon as wanted when it was needed right away

-Get appointments as soon as wanted

-Get professional help by telephone

How well clinicians communicate

-Clinicians listen carefully

-Clinicians explain things in an understandable way

-Clinicians show respect

-Clinicians spend enough time

-Feel safe with clinicians

-Patient involved as much as wanted in treatment

Perceived improvement

-Compare ability to deal with daily problems to 1 year ago

-Compare ability to deal with social situations to 1 year ago

-Compare ability to accomplish things to 1 year ago

-Compare ability to deal with symptoms or problems to 1 year ago

Getting treatment and information from the plan

-Getting new clinician

-Delays in treatment while wait for plan approval

-Getting necessary treatment

-Understanding information about treatment in booklets or on the web

-Getting help when calling customer service

-Filling out paperwork

Informed about treatment options

-Told about self-help or consumer run programs

-Told about different treatments that are available for condition

Single Item Measures:

-Overall rating of counseling and treatment (MCO and MBHO)

-Overall rating of the health plan (MCO only)

-Wait more than 15 minutes past appointment time to see clinician

-Told about medication side effects

-Talk about including family & friends in treatment

-Given as much information as wanted about how to manage condition

- Given information about rights as a patient
- Patient feels that he or she could refuse a specific type of treatment
- Was information revealed that should have been kept private
- Cultural competence -Care responsive to language, race, religious, ethnic
- Amount helped by treatment
- Plan provides information about how to get treatment after benefits used up

The measures are based on reports of care experiences over the previous six months from adult (18 years of age or older) patients receiving behavioral health care (mental health and substance abuse treatment) and the organization that provides or manages their treatment and health outcomes. Each measure score is the mean of the responses to the survey questions from patients receiving care at a particular health plan or managed behavioral health organization. More detail can be found at: <http://www.ahrq.gov/cahps/surveys-guidance/echo/about/survey-measures.html>;

Measure Type: Outcome; **Level of Analysis:** Health Plan; **Setting of Care:** Behavioral Health: Outpatient; **Data Source:** Patient Reported Data

Many have suggested that evaluating the process of care is one of the most direct ways to assess quality of care. This patient-reported outcome measure, originally endorsed in 2007, assesses patient experiences with behavioral health services in areas such as getting treatment quickly, communication with clinicians, and information about treatment options. Shortly before the in-person meeting, NQF, in agreement with the Committee co-chairs, decided to defer consideration of endorsement for this measure because there was not yet enough data for the committee to consider. The developer explained that as the instrument developer, they do not currently have data on performance scores and use, but that they do know there has been a resurgence of interest in the instrument. The developer noted several large studies underway and that they are in the process of performing new field testing. The Committee agreed that measures that captures patient experience are very important, especially as this is one of the few patient experience measures for behavioral health. The Committee further agreed that they preferred to give feedback to the developer at this time about the type of information they would need to see in order to consider continued endorsement. The Committee provided the developer with several ideas for partners who might be able to provide them with needed data on current use and performance. The Committee also suggested the development of a clear logic model that helps explain the various patient-reported outcomes included within the measure. The Committee also recommended the developer reconsider the current exclusion of patients treated in primary care settings. NQF expects to review this measure for consideration of endorsement after the measure is updated as part of its annual review.

Appendix A: Details of Measure Evaluation

Rating Scale: H=High; M=Moderate; L=Low; I=Insufficient; NA=Not Applicable; Y=Yes; N=No

Measures Recommended

| 0027 Medical Assistance With Smoking and Tobacco Use Cessation |
|--|
| <p>Submission Specifications</p> <p>Description: The three components of this measure assess different facets of providing medical assistance with smoking and tobacco use cessation:</p> <p>Advising Smokers and Tobacco Users to Quit: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who received advice to quit during the measurement year.</p> <p>Discussing Cessation Medications: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were recommended cessation medications during the measurement year.</p> <p>Discussing Cessation Strategies: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were provided cessation methods or strategies during the measurement year.</p> <p>Numerator Statement: Advising Smokers and Tobacco Users to Quit: Patients who indicated that they received advice to quit smoking or using tobacco from their doctor or health provider</p> <p>Discussing Cessation Medications: Patients who indicated that their doctor or health provider recommended or discussed smoking or tobacco cessation medications</p> <p>Discussing Cessation Strategies: Patients who indicated their doctor or health provider discussed or provided smoking or tobacco cessation methods and strategies other than medication</p> <p>Denominator Statement: Patients 18 years and older who responded to the CAHPS survey and indicated that they were current smokers or tobacco users during the measurement year or in the last 6 months for Medicaid and Medicare.</p> <p>Exclusions: None</p> <p>Adjustment/Stratification: N/A</p> <p>Level of Analysis: Health Plan, Integrated Delivery System</p> <p>Setting of Care: Clinician Office/Clinic, Other</p> <p>Type of Measure: Process</p> <p>Data Source: Patient Reported Data</p> <p>Measure Steward: National Committee for Quality Assurance</p> |
| <p>STANDING COMMITTEE MEETING 02/28/2017</p> <p>1. Importance to Measure and Report: <u>The measure meets the Importance criteria</u> (1a. Evidence, 1b. Performance Gap)</p> <p>1a. Evidence Exception: Y-22; N-0; 1b. Performance Gap: H-11; M-11; L-0; I-0</p> <p>Rationale:</p> <ul style="list-style-type: none"> In the previous submission, the developer provided evidence in the form of guidelines and recommendations from the USPSTF, ICSI, VA/DoD, and the U.S. Public Health Service related to the importance of tobacco-related prevention and treatment. For this submission, the developer provided an updated guideline from the USPSTF (2015) on behavioral and pharmacotherapy interventions for tobacco smoking cessation in adults (including pregnant women). The Committee agreed these updates were |

0027 Medical Assistance With Smoking and Tobacco Use Cessation

directionally the same as the evidence presented in the last review and so there was no need to repeat the discussion and vote on evidence.

- The developer provided performance data at the health plan level (commercial, Medicare, Medicaid) for 2014-2016 for each of the three rates reported within this measure.
 - For ‘advising smokers to quit,’ mean scores in 2016 were 86 percent (Medicare), 75 percent (commercial), and 76 percent (Medicaid).
 - For ‘discussing cessation medications,’ the mean scores in 2016 were 48 percent (commercial) and 48 percent (Medicaid).
 - For ‘discussing cessation strategies,’ the mean scores in 2016 were 44 percent (commercial) and 43 percent (Medicaid).
- The developer provided literature about significant disparities in tobacco use among certain populations, but provided limited evidence on the disparities among smoking cessation efforts in these populations.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-5; M-15; L-2; I-0** 2b. Validity: **H-9; M-12; L-1; I-0**

Rationale:

- The Committee noted concerns raised in the last round of endorsement for this measure regarding recall bias. The developer expressed interest in looking into a future measure that triangulates data from prescriptions or claims for counseling, or quit lines in order to determine what services have actually been provided to patients who still smoke.
- The developer provided an updated assessment of measure score reliability using data from all the health plans that submitted HEDIS data to NCQA for this measure and had a valid rate in 2015-2016. Beta-binomial statistics for each rate in the measure were provided by type of health plan. The 2016 statistics for Medicaid and commercial plans ranged from 0.69 to 0.83 (which were similar to improved from the scores provided in the last submission). The beta-binomial statistic for the rate of ‘advising smokers to quit’ for Medicare was 0.95 in 2010; the testing in Medicare was not updated. These scores indicate sufficient signal strength to discriminate performance between accountable entities.
- In 2011, the developer reported systematic assessment of face validity and basic information about cognitive testing (of data elements) of the CAHPS survey instrument done in 2008. The face validity testing showed that NCQA’s Committee on Performance Measurement recommended the measure for public reporting (10 supported, 1 opposed, 1 abstained).
- The Committee discussed concerns around the clarity of the questions in the measure and ensuring that patients are able to differentiate between each of the three questions. The developers explained that all questions undergo testing to help determine whether individuals are accurately interpreting the questions.
- For this submission, the developer provided new construct validity testing. This testing provided Pearson correlations ranging from 0.68 to 0.85. Scores of 0.37 or larger are considered to have a “large” correlation effect, indicating that the measure rates are significantly correlated with each other in the direction that was hypothesized.
- The Committee raised concerns related to behavioral health being a “carve out” for many states, and so behavioral health providers may be left out of this measure, since they would not be required to complete the CAHPS survey. The Committee also suggested having a stratification for behavioral health patients; the developer noted that the data captured in CAHPS could not be stratified in this way, but there could be a requirement for sampling in specific populations.

3. Feasibility: H-13; M-9; L-0; I-0

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/

0027 Medical Assistance With Smoking and Tobacco Use Cessation

unintended consequences identified 3d. Data collection strategy can be implemented)

Rationale:

- The required data elements for this measure are collected from a patient-reported survey (CAHPS).
- The patient/family reported information may be obtained via electronic or paper sources.

4. Usability and Use: H-10; M-11; L-1; I-0

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- This measure is currently used in several programs including the Medicaid Adult Core Set and the CMS Quality Rating System (QRS).
- The measure is also used for NCQA's accreditation of commercial, Medicaid, and Medicare Advantage plans. One Committee member noted that 49 states recognize NCQA health plan accreditation.

5. Related and Competing Measures

- This measure is related to several other measures:
 - 0028/3225/3185: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention
 - 1654 (TOB-2): Tobacco Use Treatment Provided or Offered
 - 1656 (TOB-3): Tobacco Use Treatment Provided or Offered at Discharge
 - 2600: Tobacco Use Screening and Follow-up for People with Serious Mental Illness or Alcohol or Other Drug Dependence
 - 2803: Tobacco Use and Help with Quitting Among Adolescents
- The Committee had a brief discussion about the portfolio of tobacco-related measures, and found that none of the measures were competing. They noted minor differences in definitions that may be considered for harmonization, but the Committee decided to table the discussion.

Standing Committee Recommendation for Endorsement: Y-22; N-0

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

8. Appeals

0576 Follow-Up After Hospitalization for Mental Illness (FUH)

[Submission](#) | [Specifications](#)

Description: The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are reported:

- The percentage of discharges for which the patient received follow-up within 30 days of discharge
- The percentage of discharges for which the patient received follow-up within 7 days of discharge.

Numerator Statement: 30-Day Follow-Up: A follow-up visit with a mental health practitioner within 30 days after discharge.

7-Day Follow-Up: A follow-up visit with a mental health practitioner within 7 days after discharge.

Denominator Statement: Discharges from an acute inpatient setting (including acute care psychiatric facilities) with a principal diagnosis of mental illness during the first 11 months of the measurement year (i.e., January 1 to December 1) for patients 6 years and older.

Exclusions: Exclude from the denominator for both rates, patients who receive hospice services during the measurement year.

0576 Follow-Up After Hospitalization for Mental Illness (FUH)

Exclude both the initial discharge and the readmission/direct transfer discharge if the readmission/direct transfer discharge occurs after December 1 of the measurement year.

Exclude discharges followed by readmission or direct transfer to a nonacute facility within the 30-day follow-up period regardless of principal diagnosis.

Exclude discharges followed by readmission or direct transfer to an acute facility within the 30-day follow-up period if the principal diagnosis was for non-mental health.

These discharges are excluded from the measure because rehospitalization or transfer may prevent an outpatient follow-up visit from taking place.

Adjustment/Stratification: N/A

Level of Analysis: Health Plan, Integrated Delivery System

Setting of Care: Clinician Office/Clinic, Behavioral Health : Inpatient, Behavioral Health : Outpatient

Type of Measure: Process

Data Source: Claims (Only)

Measure Steward: National Committee for Quality Assurance

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence, 1b. Performance Gap)

1a. Evidence: **M-15; L-4; I-1**; 1b. Performance Gap: **H-8; M-12; L-0; I-0**

Rationale:

- For the previous submission, the developer provided National Institute for Health and Care Excellence (NICE) guidelines on the treatment and management of schizophrenia.
- For this submission, the developer provided several updated clinical guidelines for the care and management of schizophrenia (NICE and American Psychological Association [APA]), bipolar disorder (APA), and major depressive disorder (APA). The developer stated that these clinical practice guidelines support follow-up after hospitalization. They also stated that evidence shows follow-up care reduces suicide attempts and readmissions and improves functioning.
- The Committee noted the variability in performance among plans, with mean scores for 2016 ranging from 33.8 percent (Medicaid) to 50.3 percent (Commercial) for the 7-day rate and from 52.4 percent (Medicare) to 69.7 percent (Commercial) for the 30-day rate.
- The Committee noted data cited by the developer that show statistically significant differences in the rates for follow-up after hospitalization for a mental disorder among various racial and ethnic groups.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-6; M-11; L-3; I-0**; 2b. Validity: **M-12; L-7; I-0**

Rationale:

- The Committee questioned the evidence for the 7-day and 30-day follow-up timeframes. The developer responded that these are consensus-based timeframes from their advisory panel. The developer also noted that studies are emerging that show that follow-up within these timeframes are contributing to reduced readmissions. One Committee member said that the 7-day and 30-day follow-up visits have become standard for managed behavioral health organizations.
- One Committee member suggested allowing telehealth visits to count toward follow-up. The developer noted that they are testing this and if approved, they will update the measure.
- One Committee member expressed concern about hospitals setting up same-day visits in their outpatient clinics in order to perform well on the measure. The developer stated they are looking at this issue, and may update the measure.
- Several Committee members expressed concern about limiting follow-up to a mental health practitioner only and suggested broadening the definition. The developer noted that their advisory panel advised this based on the seriousness of the illness (requiring hospitalization), and that they will keep pace with

0576 Follow-Up After Hospitalization for Mental Illness (FUH)

developments in how states define mental health providers (e.g., pediatricians getting more specialized training).

- One Committee member encouraged broadening the measure to include hospitalizations for drug and alcohol disorders.
- Several Committee members talked about potentially testing the measure at the facility (hospital) level in the future. The developer agreed this might help with care coordination.
- For reliability testing, the developer provided a signal-to-noise analysis for the measure score, which resulted in beta-binomial statistics all at 0.95 or above. These results were similar to the results calculated for the 2012 submission.
- For the 2012 submission, the developer stated face validity was assessed via NCQA’s standardized process (the “HEDIS measure life cycle”).
- The developer provided data on the ability to identify statistically meaningful differences by using 2016 HEDIS data to compare the differences between the 25th and 75th percentiles of performance on a measure.

3. Feasibility: H-6; M-12; L-2; I-0

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. Data collection strategy can be implemented)

Rationale:

- The Committee noted that data are in electronic sources and no implementation challenges have been reported.
- One Committee member stated a concern for areas in which the behavioral health system is not integrated with the physical health system, noting that it can be a challenge to have those data systems interact in order to sufficiently gather the necessary data.

4. Usability and Use: H-6; M-10; L-3; I-0

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- This measure is currently used in several CMS programs, including: Medicaid Child Core Set, Hospital Compare, the Physician Quality Reporting System (PQRS), the Physician Value-Based Payment Modifier (VBM), the Physician Feedback/Quality and Resource Use Reports (QRUR), and the Inpatient Psychiatric Facility Quality Reporting Program (IPFQR).
- The measure is also used for NCQA’s accreditation of commercial, Medicaid, and Medicare plans.

5. Related and Competing Measures

- This measure relates to NQF #1937: Follow-Up After Hospitalization for Schizophrenia (7-day and 30-day). In 2012, the Committee recommended the developer incorporate NQF # 1937 as a subset or target population within NQF # 0576. At this current meeting, the Committee decided to table discussion of any updates.

Standing Committee Recommendation for Endorsement: Y-16; N-4

Rationale

- The Committee clarified that they were voting on the measure as it stands, and not considering potential updates as [previously suggested](#) (e.g., inclusion of telehealth, removal of same-day visit).

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

0576 Follow-Up After Hospitalization for Mental Illness (FUH)

8. Appeals

3132 Preventive Care and Screening: Screening for Depression and Follow-Up Plan

[Submission](#) | [Specifications](#)

Description: Percentage of patients aged 12 years and older screened for depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen

Numerator Statement: Patients screened for depression on the date of the encounter using an age appropriate standardized tool AND if positive, a follow-up plan is documented on the date of the positive screen

Denominator Statement: All patients aged 12 years and older before the beginning of the measurement period with at least one eligible encounter during the measurement period

Exclusions: Patients with an active diagnosis for Depression or a diagnosis of Bipolar Disorder are excluded. Patients with any of the following are excepted: patient reason(s), patient refuses to participate, or medical reason(s); patient is in an urgent or emergent situation where time is of the essence and to delay treatment would jeopardize the patient's health status; or situations where the patient's functional capacity or motivation to improve may impact the accuracy of results of standardized depression assessment tools (for example: certain court appointed cases or cases of delirium).

Adjustment/Stratification: N/A

Level of Analysis: Clinician : Group/Practice, Clinician : Individual

Setting of Care: Clinician Office/Clinic

Type of Measure: Process

Data Source: Electronic Health Record (Only)

Measure Steward: Centers for Medicare & Medicaid Services

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence, 1b. Performance Gap)

1a. Evidence Exception: **Y-23; N-0**; 1b. Performance Gap: **H-13; M-10; L-0; I-0**

Rationale:

- This measure is the new eMeasure version of measure #3148. The information provided for Evidence is identical to that submitted for #3148. Measure #3148 was discussed first and the rating for evidence was automatically assigned to this eMeasure without further discussion.
- The developer provided data on performance rates for EHR data showing a mean performance rate in CY2015 of 68.8 percent.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-9; M-13; L-1; I-0**; 2b. Validity: **M-18; L-4; I-1**

Rationale:

- The data elements are clearly defined and compliant with industry standards.
- The Committee noted that the measure score was assessed using EHR data from two different practices (one primary care and one pediatrics), and a beta binomial method was used to perform a signal-to-noise analysis. This analysis showed a mean reliability score of 0.984.
- One Committee member expressed a concern about the small sample. The developer cited a short timeframe to prepare for the Committee meeting, and given that participation was voluntary, they could not include more sites in this round of testing.

| |
|---|
| <ul style="list-style-type: none"> • The Committee noted that Bonnie testing on 22 test cases confirmed there was a test case for each pathway of logic, and that all the test cases performed as expected. • The Committee noted that face validity testing with an expert panel showed that nine of 12 clinicians surveyed (75 percent) agreed or strongly agreed that the measure accurately reflects quality of care. |
| <p>3. Feasibility: H-8; M-14; L-1; I-0 <i>(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. 3148 Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan

jeopardize the patient's health status

- Situations where the patient's functional capacity or motivation to improve may impact the accuracy of results of standardized depression assessment tools. For example: certain court appointed cases or cases of delirium

- Patient has an active diagnosis of Depression

- Patient has a diagnosed Bipolar Disorder

Adjustment/Stratification: N/A

Level of Analysis: Clinician : Group/Practice, Clinician : Individual

Setting of Care: Clinician Office/Clinic

Type of Measure: Process

Data Source: Claims (Only), Registry

Measure Steward: Centers for Medicare & Medicaid Services

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence, 1b. Performance Gap)

1a. Evidence Exception: **Y-23; N-0**; 1b. Performance Gap: **H-17; M-6; L-0; I-0**

Rationale:

- In the last review, the developer cited several studies and reviews related to screening for depression in both children and adults (USPSTF 2009, ICSI 2011, ICSI 2012).
- The developer provided USPSTF and ICSI guidelines (2016). The Committee agreed these updated guidelines were directionally the same as the evidence presented in the last review and so there was no need to repeat the discussion and vote on evidence.
- The Committee noted data showing a mean performance rate in CY2015 of 36.5 percent for claims and 28.9 percent for registry (provider). The developer also provided literature indicating lower rates of screening and treatment in minority adults.
- The Committee noted that PQRS data show performance rates have been going down (from 82.6 percent in 2011 to 52.4 percent in 2014). However, the developer noted more providers are reporting on this measure as it is required for ACOs. Committee members agreed this is typical in that measures are often reported initially by high performers, and then performance rates go down as the pool of reporting providers broadens.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-8; M-14; L-1; I-0** 2b. Validity: **M-18; L-3; I-2**

Rationale:

- In the previous review, the developer provided data on the inter-rater reliability testing of the data elements on a random sample of 275 Medicare claims, resulting in 89.7 percent agreement for the numerator, 100 percent agreement for the denominator, and 66.5 percent agreement for exclusions.
- The Committee noted good results in updated reliability testing – using a signal-to-noise analysis at the score level, the developer reported a mean reliability statistic of 0.99 for both claims and registry.
- Committee members expressed concerns about particular exclusions. One expressed concern about excluding people who refuse screening, noting that people who are depressed might be more inclined to refuse to engage in such activity. Committee members expressed concern about other exclusions including the emergent nature of a visit, noting that the emergent visit might be the result of a risk-taking behavior related to depression and about excluding individuals with bipolar disorder, because the assumption that they're in treatment may not be true. One Committee member expressed concern about emergency room physicians being evaluated on this measure, but the developer clarified that the evaluation and management codes for emergency medicine are excluded from this measure.
- The developer noted that exclusions do not occur frequently. (For Medicare claims, 3.6 percent of eligible encounters were excluded and for registry data, 4.9 percent of eligible encounters were excluded.) The

3148 Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan

developer further noted that “active diagnosis of depression” was the most common exclusion.

- One Committee member suggested adding an exclusion for “adjustment disorder with depressed mood” in order to avoid overly aggressive treatment. The developer clarified that the “follow-up plan” does not require being seen by a psychiatrist or psychologist or starting medication, but rather could include referral to pastoral counselor or even just to have a return visit in 2 weeks, as long as it is documented.
- The Committee expressed concern about the frequency of screening, asking if the screening should occur at each visit. The developer noted that the clinician could screen more frequently if there were indications that it was needed.
- The Committee noted that face validity testing showed that nine of 12 clinicians surveyed (75 percent) agreed or strongly agreed that the measure accurately reflects quality of care.

3. Feasibility: H-12; M-9; L-1; I-0

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. Data collection strategy can be implemented)

Rationale:

- The Committee noted that data elements are routinely collected in electronic sources and there have been no implementation challenges noted. The developer emphasized that for this claims/registry measure, they use HCPCS codes for reporting.
- One Committee member expressed concern with the difficulty of documenting the follow-up plan.

4. Usability and Use: H-3; M-17; L-2; I-0

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- This measure is currently used in several CMS programs, including: Medicaid Adult Core Set, the Medicare Shared Savings Program (MSSP), the Electronic Health Record Incentive Program, the Physician Value-Based Payment Modifier (VBM), the Physician Feedback/Quality and Resource Use Reports (QRUR), and Physician Compare.
- As noted earlier, the Committee restated the decreasing performance that is likely due to the increased number of individuals reporting on the measure. The developer agreed, noting that the declining numbers as more people are reporting show the true gap and opportunity for improvement.
- The Committee expressed a desire to learn more about impact on outcomes and comparison across plans. The developer noted that they only have access to CMS Medicare claims. The developer further noted that they are using the measure to identify the under-diagnosis of depression and encourage more screening.
- One Committee member asked about harmonizing this measure with the PHQ-9 depression measure. The developer noted they have discussed this with their expert work group, but that this measure is not prescriptive about which screening tool should be used.

5. Related and Competing Measures

- This measure relates to NQF #3132: Preventive Care and Screening: Screening for Depression and Follow-Up Plan. NQF #3132 is the eMeasure version of NQF #3148 and has been harmonized to the extent possible, thus the Committee did not discuss harmonization.

Standing Committee Recommendation for Endorsement: Y-23; N-0

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

3175 Continuity of Pharmacotherapy for Opioid Use Disorder

[Submission](#) | [Specifications](#)

Description: Percentage of adults 18-64 years of age with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment

Numerator Statement: Individuals in the denominator who have at least 180 days of continuous pharmacotherapy with a medication prescribed for OUD without a gap of more than seven days

Denominator Statement: Individuals 18-64 years of age who had a diagnosis of OUD and at least one claim for an OUD medication

Exclusions: There are no denominator exclusions.

Adjustment/Stratification: N/A

Level of Analysis: Health Plan, Population : Regional and State

Setting of Care: Clinician Office/Clinic, Behavioral Health : Outpatient

Type of Measure: Process

Data Source: Claims (Other), Pharmacy

Measure Steward: RAND Corporation

STANDING COMMITTEE MEETING 03/01/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence: 1b. Performance Gap, 1c. High Priority)

1a. Evidence: **H: 3; M-10; L-0; I-5**; 1b. Performance Gap: **H-5; M-11; L-1; I-1**

Rationale:

- The developer provided guidelines on the management of substance use disorders (VA/DoD 2015). In addition, they cited evidence showing the increased mortality associated with interruption of medication, with highest risks being in the first few weeks after stopping the medication.
- One Committee member noted an article not included in this submission from the *New England Journal of Medicine* in March 2016 on vivitrol.
- The developer also provided evidence on reasoning for choice of 6-month continuation (based on FDA trial lengths) and 7-day gap (drug effectiveness and mortality risk following interruption of medication). The developer noted there is no empirical evidence on the best length of time overall for patients to stay on these medications, and suggests this as a needed area of research.
- The Committee noted the gaps in performance, with mean performance in 2014-2015 of 27.7 percent, (10th percentile at 16.2 percent and 90th percentile at 40.9 percent).

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-0; M-15; L-2; I-2**; 2b. Validity: **M-14; L-2; I-3**

Rationale:

- The Committee had extensive discussions about how the measure was specified – in particular, they expressed concern about the measure capturing individuals who are appropriately discontinuing their medication, as the measure cannot tell which patients have been on medication for years. The Committee asked why the measure was not specified to only look at those who had just initiated treatment. The developer acknowledged this could lead to some measurement error, but they expected this to only be a small number. The developer said they made the choice to err on the side of sensitivity over specificity in order to be more generalizable and look at a cross-section of patients, given that the

3175 Continuity of Pharmacotherapy for Opioid Use Disorder

performance gap is so large. The developer also noted that the measure has a rolling 2-year timeframe. The developer also noted that it can be difficult to identify those who have been on medications long term in commercial insurance because individuals can change plans over time.

- One Committee member expressed concern that the measure could encourage providers to keep patients on their medications unnecessarily.
- The Committee also raised issues about the measure not including counseling in conjunction with medication. The developer cited issues with defining counseling, and the ability to capture all types of counseling (e.g., community-based support groups). The Committee suggested in the future the measure might be expanded to set a minimum standard for the occurrence of any type of counseling.
- The Committee asked why the measure had only been tested in the commercial insurance pool. The developer noted timeline constraints to submit the measure for consideration, but stated they intend to do testing in both the Medicare and Medicaid populations.
- The developer provided a signal-to-noise analysis showing reliability rates of 0.977 at the state level and 0.891 at the health plan level.
- The Committee noted the face validity testing of the measure score resulted in eight of 10 experts in agreement that the measure can be used to distinguish good quality from poor quality.
- The Committee had several suggestions for improvements to the measures specifications in the future including:
 - Expansion of the patient pool (e.g., Medicare, Medicaid).
 - Stratification of the data for patients who have just initiated medication and those who have been on medication for a longer time.
 - Addition of a counseling component.

3. Feasibility: H-8; M-10; L-1; I-0

(3a. Data generated during care; 3b. Electronic sources; and 3c. Data collection can be implemented (eMeasure feasibility assessment of data elements and logic)

Rationale:

- The Committee noted that the data are readily available in electronic form and no issues have been reported in testing.

4. Use and Usability: H-1; M-11; L-5; I-2

(4a. Accountability/transparency; and 4b. Improvement – progress demonstrated; and 4c. Benefits outweigh evidence of unintended negative consequences)

Rationale:

- The Committee strongly recommended that the measure not be used in pay-for-performance programs initially.

5. Related and Competing Measures

- This measure relates to NQF #0004: Initiation and Engagement of Alcohol and Other Drug Dependence Treatment (IET). NQF #0004 was discussed with the Committee in October 2016, and discussions around harmonization have been deferred until after an update is available.
- This measure relates to NQF #1664: SUB-3 Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and SUB-3a Alcohol & Other Drug Use Disorder Treatment at Discharge, a facility-level measure for the hospital setting. There are minor differences that may be considered for harmonization, but the Committee decided to table discussion.

3175 Continuity of Pharmacotherapy for Opioid Use Disorder

Standing Committee Recommendation for Endorsement: Y-12; N-7

- The Committee clarified that they were voting on the measure as it stands, and not considering potential updates as [previously suggested](#) (e.g., stratification of new users, addition of counseling).

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

8. Appeals

3205 Medication Continuation Following Inpatient Psychiatric Discharge

[Submission](#) | [Specifications](#)

Description: This measure assesses whether psychiatric patients admitted to an inpatient psychiatric facility (IPF) for major depressive disorder (MDD), schizophrenia, or bipolar disorder filled a prescription for evidence-based medication within 2 days prior to discharge and 30 days post-discharge. The performance period for the measure is two years.

Numerator Statement: The numerator for this measure includes:

- Discharges with a principal diagnosis of MDD in the denominator population for which patients were dispensed evidence-based outpatient medication within 2 days prior to discharge through 30 days post-discharge
- Discharges with a principal diagnosis of schizophrenia in the denominator population for which patients were dispensed evidence-based outpatient medication within 2 days prior to discharge through 30 days post-discharge
- Discharges with a principal diagnosis of bipolar disorder in the denominator population for which patients were dispensed evidence-based outpatient medication within 2 days prior to discharge through 30 days post-discharge

Denominator Statement: The target population for this measure is Medicare fee-for-service (FFS) beneficiaries with Part D coverage aged 18 years and older discharged from an inpatient psychiatric facility with a principal diagnosis of MDD, schizophrenia, or bipolar disorder.

Exclusions: The denominator for this measure excludes discharged patients who:

- Received Electroconvulsive Therapy (ECT) during the inpatient stay or follow-up period.
- Received Transcranial Magnetic Stimulation (TMS) during the inpatient stay or follow-up period.
- Were pregnant during the inpatient stay.
- Had a secondary diagnosis of delirium.
- Had a principal diagnosis of schizophrenia with a secondary diagnosis of dementia.

Adjustment/Stratification: N/A

Level of Analysis: Facility

Setting of Care: Behavioral Health : Inpatient

Type of Measure: Process

Data Source: Claims (Only)

Measure Steward: Centers for Medicare & Medicaid Services, Contracting Officer's Representative (COR)

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence: 1b. Performance Gap, 1c. High Priority)

1a. Evidence: **M-21; L-2; I-0**; 1b. Performance Gap: **H-7; M-16; L-0; I-0**

Rationale:

3205 Medication Continuation Following Inpatient Psychiatric Discharge

- The developer provided evidence for medication continuation based on treatment guidelines for major depressive disorder (APA 2010, VA/DoD 2016), schizophrenia (APA 2010), and bipolar disorder (APA 2002, VA/DoD 2010).
- The Committee agreed there is evidence that lack of adherence to medication leads to relapse and negative outcomes. They also noted that claims data related to medication adherence are directly correlated to outcomes.
- The Committee noted that the overall distribution of performance score seemed somewhat high with a performance rate of 66.7 percent in the tenth percentile, and a rate of 88.3 percent in the 90th percentile. The developer agreed with a hypothesis that the patient population likely did not have access issues (e.g., all have full prescription drug coverage). The Committee also notes that this measure may not correlate with the lower performance rates of a measure of post-discharge follow-up because that measure only looks at follow-up with a behavioral health provider, while geriatric patients may more typically follow up with a primary care physician.
- The Committee also noted the developer's findings that black patients have significantly worse rates of medication continuation than the reference group; specific data were not provided.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-6; M-17; L-0; I-0**; 2b. Validity: **H-2; M-18; L-3; I-0**

Rationale:

- The developers performed a signal-to-noise analysis and found that a provider needs to have at least 75 discharges in order to obtain an overall reliability score of at least 0.7 (the minimum acceptable reliability value). The developer noted that 1,200 of about 1,700 of the facilities had at least 75 discharges. They further noted that they use a 2-year measurement period to increase the number of facilities eligible to report.
- One Committee member expressed concern about the number of patients who do not show their prescription cards due to the extremely low cost of generic drugs, and so may not be captured.
- Committee members raised questions related to the fact that the measure only looks at prescriptions being filled, and not if the medication is being taken correctly (or at all). The developer noted that most studies use a proxy for adherence (filling of the prescription), so most of the outcomes data related to adverse events are related to filling of the prescription and not a patient-reported measure of attestation about actually taking the medication.
- The Committee also questioned how the measure would work for individuals who already had a supply of medication at home. The developer said they did an analysis of patients in the cohort and found that for the overwhelming majority of patients, their last prescription fill prior to an inpatient hospitalization was for a 30 day supply, so those individuals would still likely be captured.
- For validity testing, the developer performed a Spearman's rank correlation showing that the proposed measure correlates as expected with existing endorsed measures. In particular, the developer noted a large correlation effect (0.43) with a measure of follow-up after hospitalization (30-day).

3. Feasibility: H-14; M-9; L-0; I-0

(3a. Data generated during care; 3b. Electronic sources; and 3c. Data collection can be implemented (eMeasure

3205 Medication Continuation Following Inpatient Psychiatric Discharge

feasibility assessment of data elements and logic)

Rationale:

- The Committee noted that the required data elements are routinely collected, and there have been no reports of implementation challenges.

4. Use and Usability: H-5; M-15; L-3; I-0

(4a. Accountability/transparency; and 4b. Improvement – progress demonstrated; and 4c. Benefits outweigh evidence of unintended negative consequences)

Rationale:

- Several Committee members raised concerns about the hospital being held responsible for patients' filling prescriptions, particularly for hospitals such as public hospitals with transient populations. The developer stated that they see this measure as the first step in continuity of care, and they are not considering the facility responsible for long-term follow up. Other Committee members noted that it may drive hospitals to use outpatient pharmacies and also to ensure they are educating the patients on the importance of taking the medication.
- The Committee also recommended the developer to try to expand the measure denominator to include Medicare Advantage and/or other patients.

5. Related and Competing Measures

- No related or competing measures noted.

Standing Committee Recommendation for Endorsement: Y-20; N-3

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

8. Appeals

3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

[Submission](#) | [Specifications](#)

Description: Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation intervention if identified as a tobacco user

Numerator Statement: Patients who were screened for tobacco use at least once within 24 months AND who received tobacco cessation intervention if identified as a tobacco user

Denominator Statement: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period

Exclusions: Documentation of medical reason(s) for not screening for tobacco use (e.g., limited life expectancy, other medical reason)

Adjustment/Stratification: N/A

Level of Analysis: Clinician : Group/Practice, Clinician : Individual

Setting of Care: Clinician Office/Clinic, Home Health, Other, Behavioral Health : Outpatient

Type of Measure: Process

Data Source: Electronic Health Record (Only)

Measure Steward: PCPI Foundation

3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence, 1b. Performance Gap)

1a. Evidence Exception: **Y-24; N-0**; 1b. Performance Gap: **H-8; M-16; L-0; I-0**

Rationale:

- This measure is the new eMeasure version of NQF #3225. The information provided for Evidence is identical to that submitted for #3225. Measure 3225 was discussed first and the rating for evidence was automatically assigned to this eMeasure without further discussion.
- The developer provided data showing the average PQRS EHR performance rate for 2015 as 76.38 percent, with a range of 27.84 percent (1st decile) to 100 percent (10th decile)
- As for Measure 3225, the developer cited literature showing that rates of tobacco screening and intervention varied by patients' race, age, and insurance status.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-5; M-19; L-0; I-0** 2b. Validity: **M-19; L-5; I-0**

Rationale:

- The data elements are clearly defined and compliant with industry standards.
- One Committee member suggested that dental offices be included as a setting of care.
- One Committee member suggested making the denominator less restrictive by removing the requirement for "at least two visits," noting that the patients who are seen less frequently may be in more need of assistance.
- A Committee member also suggested changing the measure so that the provider must report separate rates for screening and treatment, with the stipulation that the provider is required to report on both rates. The developer noted they have modeled this and CMS is reviewing this possibility.
- The Committee again discussed the exclusion for "medical reasons" (as was discussed in an [earlier](#) discussion of Measure #3225), with the developer again noting this is a rare occurrence (0.4 percent). The Committee discussed the need for caution in creating a situation in which the measure can be "gamed," especially as more individuals report on the measure.
- The developer reported that the reliability of the measure score was assessed using 2015 data reported via the EHR option to the PQRS program. A beta binomial method was used to perform a signal-to-noise analysis. This analysis showed a reliability statistic of 0.81 at the minimum number of events and a statistic of 0.99 at the average number of events.
- The developer reported that Bonnie testing on 40 test cases confirmed there was a test case for each pathway of logic, and that all the test cases performed as expected.
- The developer reported that face validity testing with an expert panel showed that six of 10 clinicians surveyed (60 percent) agreed or strongly agreed that the measure can accurately distinguish good and poor quality.

3. Feasibility: **H-7; M-17; L-0; I-0**

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. Data collection strategy can be implemented)

Rationale:

- The data can be obtained through EHRs.
- The Committee noted that the feasibility assessment showed that only 17 of the 26 elements were currently feasible. The developer explained that some providers cannot use certain codes (e.g., an internal medicine provider may not be able to use behavioral health codes). In addition, some EHRs cannot capture some of the exclusions in structured fields, and the developer noted that most providers will use free text for documentation.

3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

4. Usability and Use: H-10; M-14; L-0; I-0

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- This measure is currently used in several CMS programs, including: Medicare Shared Savings Program (MSSP); Physician Value-Based Payment Modifier (VBM) and Physician Feedback/Quality and Resource Use Reports (QRUR).
- The Committee stressed the importance and need for screening and intervention in mental health and substance use disorder populations.

5. Related and Competing Measures

- No competing measures noted.
- Related Measures include:
 - 0027: Medical Assistance With Smoking and Tobacco Use Cessation
 - 1651: TOB-1 - Tobacco Use Screening
 - 1654: TOB-2 - Tobacco Use Treatment Provided or Offered
 - 1656: TOB-3- Tobacco Use Treatment Provided or Offered at Discharge
 - 2600 : Tobacco Use Screening and Follow-up for People with Serious Mental Illness or Alcohol or Other Drug Dependence
 - 2803 : Tobacco Use and Help with Quitting Among Adolescents
 - 3225: Tobacco Use: Screening and Cessation Intervention
- The Committee had a brief discussion about the portfolio of tobacco-related measures, and found that none of the measures were competing. They noted minor differences in definitions that may be considered for harmonization, but the Committee decided to table the discussion.

Standing Committee Recommendation for Endorsement: Y-24; N-0

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

8. Appeals

3225 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

[Submission](#) | [Specifications](#)

Description: Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation intervention if identified as a tobacco user

Numerator Statement: Patients who were screened for tobacco use at least once within 24 months AND who received tobacco cessation intervention if identified as a tobacco user

Denominator Statement: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period

Exclusions: Documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason)

Measure Steward: PCPI Foundation

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence, 1b. Performance Gap)

1a. Evidence Exception: **Y-24; N-0**; 1b. Performance Gap: **H-6; M-14; L-2; I-1**

Rationale:

- In 2012, the developer provided guidelines from the U.S. Public Health Service and the USPSTF that recommend clinicians ask all adults about tobacco use and provide tobacco cessation interventions for those who use tobacco products.
- For this submission, the developer provided updated statements from the USPSTF (2015), noting high quality, quantity, and consistency of the evidence base.
- The Committee agreed the updates in the evidence were directionally the same as the evidence presented in the last review and so there was no need to repeat the discussion and vote on evidence.
- The developer reported an average performance rate in 2014 of 88.9 percent, with 21.7 percent of eligible professionals reporting on the measure. For claims, the fourth through tenth percentiles were all performing at 100 percent. For the registry, the eighth through tenth percentiles were performing at 100 percent.
- The Committee discussed the high rates of performance. Some Committee members noted that high performers may be choosing this measure to report on and the developer stated that the literature suggests the performance is likely lower in the broader provider population.
- The developer cited literature showing that rates of tobacco screening and intervention varied by patients' race, age, and insurance status.
- Committee members noted a desire to see gaps specifically for patients with mental health and substance use disorders.

2. Scientific Acceptability of Measure Properties: The measure meets the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-11; M-12; L-0; I-0** 2b. Validity: **M-20; L-2; I-1**

Rationale:

- One Committee member questioned the 24-month period for screening and intervention. The developer explained that the interval was based on feedback from expert workgroups; they noted that screening and intervention can certainly be done more often than this interval – the measure only works to ensure it is done at least once in this time period.
- Other Committee members raised issues about how the offer for cessation interventions is documented, and the developer confirmed that this often relies on attestation from the provider. Committee members noted that there may be challenges in documenting interventions that are captured in other places (e.g., workplace wellness programs).
- One Committee member questioned exclusions for “medical reasons” (e.g., limited life). The developer said this was suggested as appropriate by expert workgroups and also deemed appropriate by palliative care groups. They noted that these types of exclusions occur infrequently.
- Several Committee members discussed the need to expand this measure (and other tobacco measures) to include other forms of nicotine delivery (e.g., electronic cigarettes). They also recognized that this would add to the burden of documentation and data collection.
- The Committee also suggested expanding this measure to cover adolescents, and also discussed the possibility of linking this measure to actual decreases in rates of tobacco use. Another suggestion was to develop a stratification for the rates for patients with mental health and substance use disorders.
- The developer reported that the reliability of the measure score was re-assessed for this submission

3225 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

using a beta-binomial method to perform a signal-to-noise analysis. The developer used two testing samples – one using 2015 data reported via the registry option to the PQRS program and one using the claims option. For the registry option, this analysis showed a reliability statistic of 0.78 at the minimum number of events and a statistic of 0.99 at the average number of events. For the claims option, this analysis showed a reliability statistic of 0.71 at the minimum number of events and a statistic of 0.97 at the average number of events.

- The developer provided updated face validity testing which showed that six of ten clinicians (60 percent) surveyed agreed or strongly agreed that the measure can accurately distinguish good and poor quality. During the meeting, the developer noted that since the submission, they had received more feedback from their experts (for a total of 29 responses), resulting in an increase of the validity testing score to 76 percent.

3. Feasibility: H-12; M-11; L-0; I-0

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. Data collection strategy can be implemented)

Rationale:

- The Committee agreed that the measure is feasible to implement, as the data can be obtained through claims registry and/or patient records.

4. Usability and Use: H-12; M-10; L-2; I-0

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- The measure is currently used in several CMS programs including Physician Quality Reporting System (PQRS), Physician Compare, and the Medicare Shared Savings Program (MSSP).

5. Related and Competing Measures

- This measure is related to several other measures:
 - 0027: Medical Assistance With Smoking and Tobacco Use Cessation
 - 1651: TOB-1 - Tobacco Use Screening
 - 1654: TOB-2 - Tobacco Use Treatment Provided or Offered
 - 1656: TOB-3- Tobacco Use Treatment Provided or Offered at Discharge
 - 2600: Tobacco Use Screening and Follow-up for People with Serious Mental Illness or Alcohol or Other Drug Dependence
 - 2803: Tobacco Use and Help with Quitting Among Adolescents
 - 3185: Tobacco Use: Screening and Cessation Intervention (eMeasure)
- The Committee had a brief discussion about the portfolio of tobacco-related measures, and found that none of the measures were competing. They noted minor differences in definitions that may be considered for harmonization, but the Committee decided to table further discussions.

Standing Committee Recommendation for Endorsement: Y-24; N-0

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

8. Appeals

Measures with Endorsement Decision Deferred

The following measure submitted for the Standing Committee's review during the project has been deferred for future consideration:

0008 Experience of Care and Health Outcomes (ECHO) Survey

[Submission](#)

Description: The ECHO is a survey that includes 5 multiple item measures and 12 single item measures:

Multiple Item Measures:

Getting treatment quickly

-Get treatment as soon as wanted when it was needed right away

-Get appointments as soon as wanted

-Get professional help by telephone

How well clinicians communicate

-Clinicians listen carefully

-Clinicians explain things in an understandable way

-Clinicians show respect

-Clinicians spend enough time

-Feel safe with clinicians

-Patient involved as much as wanted in treatment

Perceived improvement

-Compare ability to deal with daily problems to 1 year ago

-Compare ability to deal with social situations to 1 year ago

-Compare ability to accomplish things to 1 year ago

-Compare ability to deal with symptoms or problems to 1 year ago

Getting treatment and information from the plan

-Getting new clinician

-Delays in treatment while wait for plan approval

-Getting necessary treatment

-Understanding information about treatment in booklets or on the web

-Getting help when calling customer service

-Filling out paperwork

Informed about treatment options

-Told about self-help or consumer run programs

-Told about different treatments that are available for condition

Single Item Measures:

-Overall rating of counseling and treatment (MCO and MBHO)

-Overall rating of the health plan (MCO only)

-Wait more than 15 minutes past appointment time to see clinician

-Told about medication side effects

-Talk about including family & friends in treatment

-Given as much information as wanted about how to manage condition

-Given information about rights as a patient

-Patient feels that he or she could refuse a specific type of treatment

-Was information revealed that should have been kept private

-Cultural competence -Care responsive to language, race, religious, ethnic

0008 Experience of Care and Health Outcomes (ECHO) Survey

-Amount helped by treatment

-Plan provides information about how to get treatment after benefits used up

The measures are based on reports of care experiences over the previous six months from adult (18 years of age or older) patients receiving behavioral health care (mental health and substance abuse treatment) and the organization that provides or manages their treatment and health outcomes.

Each measure score is the mean of the responses to the survey questions from patients receiving care at a particular health plan or managed behavioral health organization.

More detail can be found at: <http://www.ahrq.gov/cahps/surveys-guidance/echo/about/survey-measures.html>

Numerator Statement: No changes from original specification: The ECHO survey measures patient-centered care by asking about patient experiences with behavioral health care (mental health and substance abuse treatment) and the organizations that provide or manage the person's treatment and health outcomes.

Denominator Statement: All survey respondents, or for selected items, all respondents who respond appropriately to screening questions.

Exclusions: No changes: Patients who received behavioral health services only in primary care settings (e.g. psychotropic medications from their primary care physician) are not included.

Adjustment/Stratification: N/A

Level of Analysis: Health Plan

Setting of Care: Behavioral Health: Outpatient

Type of Measure: Outcome: PRO

Data Source: Patient Reported Data

Measure Steward: Agency for Healthcare Research and Quality

STANDING COMMITTEE MEETING 03/01/2017

1. Importance to Measure and Report:

(1a. Evidence, 1b. Performance Gap, 1c. Composite - Quality Construct)

Rationale:

- The Committee noted the importance of patient experience measures, especially to behavioral health. The developer said there has been a resurgence of interest in the instrument in the last year and there are several large studies currently underway. In addition, they are currently in the process of field testing which may result in a major update of the measure.
- The developer could not provide data on performance gap at this time, but the Committee noted this is one of the few measures of patient experience for behavioral health care.
- The Committee provided the developer with several ideas for partners who might be able to provide them with needed data (e.g., ACORN, specific state programs).

2. Scientific Acceptability of Measure Properties:

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity; 2d. Composite – Empirical Analysis for Construction)

Rationale:

- The developer described how the measure was developed, particularly around the use of focus groups to talk to patients about what they think quality means as well as for cognitive testing of the instrument.
- The Committee suggested development of a clear logic model that helps explain the various patient-reported outcomes included within the measure.
- The Committee suggested the developer reconsider the exclusion of patients treated in primary care settings.

3. Feasibility: N/A

(3a. Clinical data generated during care delivery; 3b. Electronic sources; 3c. Susceptibility to inaccuracies/unintended consequences identified 3d. Data collection strategy can be implemented)

0008 Experience of Care and Health Outcomes (ECHO) Survey

4. Usability and Use:

(Used and useful to the intended audiences for 4a. Accountability and Transparency; 4b. Improvement; and 4c. Benefits outweigh evidence of unintended consequences)

Rationale:

- The Committee provided the developer with several suggestions of how to go about determining use of the measure.
- The developer noted several state projects that are using the measure which might be sources of data.

5. Related and Competing Measures

- No related or competing measures noted.

Standing Committee Recommendation for Endorsement: N/A

6. Public and Member Comment: N/A

7. Consensus Standards Approval Committee (CSAC) Vote: Y-X; N-X

Rationale for deferral

Shortly before the in-person meeting and in agreement with the Committee co-chairs, the NQF decided to defer consideration of endorsement for this measure because there was not yet enough information for the Committee to consider. The developer explained that as the instrument developer, they do not currently have data on scores and usage, but are in the process of performing some field testing. The Committee agreed that this type of measure that captures patient experience is very important, and they further agreed that they preferred to give feedback to the developer at this time about the type of information they would need to see in order to consider continued endorsement. NQF expects to review this measure for consideration of endorsement after the measure is updated as part of its annual review.

Measures Not Recommended

0108 Follow-Up Care for Children Prescribed ADHD Medication (ADD)

[Submission](#)

Description: Percentage of children newly prescribed attention-deficit/hyperactivity disorder (ADHD) medication who had at least three follow-up care visits within a 10-month period, one of which is within 30 days of when the first ADHD medication was dispensed.

An Initiation Phase Rate and Continuation and Maintenance Phase Rate are reported.

Numerator Statement: Among children newly prescribed ADHD medication, those who had timely and continuous follow-up visits.

Denominator Statement: Children 6-12 years of age newly prescribed ADHD medication.

Exclusions: Children who had an acute inpatient encounter for mental health or chemical dependency following the Index Prescription Start Date

Children with a diagnosis of narcolepsy: Many of the medications used to identify patients for the denominator of this measure are also used to treat narcolepsy. Children with narcolepsy who are pulled into the denominator are then removed by the narcolepsy exclusion.

Children using hospice services during the measurement year. Children in hospice may not be able to receive the necessary follow-up care.

Adjustment/Stratification: N/A

Level of Analysis: Health Plan, Integrated Delivery System

Setting of Care: Clinician Office/Clinic

Type of Measure: Process

Data Source: Claims (Only), Pharmacy

0108 Follow-Up Care for Children Prescribed ADHD Medication (ADD)

Measure Steward: National Committee for Quality Assurance

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: **Did not reach consensus on the Importance criteria**

1a. Evidence: **H-1; M-8; L-7; I-4**; 1b. Performance Gap: **H-6; M-9; L-2; I-1**

Rationale:

- In 2014, the developer cited AAP clinical practice guidelines and AACAP practice parameters for the treatment of ADHD in children and adolescents. For this current submission, the developer stated “Numerous (>100) studies related to the care for patients with ADHD have been published since the publication of this guideline, none of which contradict the need for appropriate follow-up once treatment with medication begins.”
- One Committee member noted that while the initial 30-day timeframe is supported by AAP guidelines, there is no literature to support that timeframe and that the AAP acknowledges it is based on an agreement among individuals that the timeframe is appropriate. The Committee member further noted a 2017 study of this measure which showed that the poor performers (for the 30-day rate) actually had lower use of EDs and lower hospitalizations, because compliant parents (who came in for follow-up) were willing to bring them in to the ED more often. Additionally, the Committee member stated the study showed that expanding the timeframe resulted in a 20 percent increase in compliance.
- One Committee member emphasized that the focus of the measure is largely supported by clinical practice guidelines and not strong evidence. They also noted that the AACAP guidelines do not suggest a specific timeframe for follow-up.
- One Committee member asked about studies on how consumers felt about having to come back in (related to burden).
- One Committee member asked about the extensiveness of the literature review since the field has been changing. The developer said their review did not rise to the level of a systematic review, but instead was a review for any evidence saying the measure was outdated, no longer effective, or causing harm.
- One Committee member raised concern about an overestimation of adherence, because many children do not get to the maintenance phase.
- Committee members also noted that the use of ADHD medications has gone up exponentially, so follow-up is very important conceptually.
- The Committee did not reach consensus on the evidence subcriterion.
- The Committee noted that the 10th percentile of performers has a performance rate of 29 percent for both Medicaid and Commercial plans, and the 90th percentile has a 50 percent performance rate for Commercial plans and 56 percent for Medicaid, representing a big gap in performance.
- Committee members also noted very little change in performance over the years.

2. Scientific Acceptability of Measure Properties: **Did not meet the Scientific Acceptability criteria**

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-7; M-8; L-5; I-0**; 2b. Validity: **H-2; M-5; L-11; I-2**

Rationale:

- The developer provided an update of reliability testing of the measure score using a signal-to-noise analysis. The initiation phase demonstrated beta-binomial statistics of 0.90 (Commercial) and 0.98

0108 Follow-Up Care for Children Prescribed ADHD Medication (ADD)

(Medicaid) for the initiation phase, and statistics of 0.75 (Commercial) and 0.95 (Medicaid) for the continuation phase.

- Validity testing included face validity testing with panels of experts. One Committee member raised concern about the low number of providers on the panel who were physicians or prescribers of medication, as well as the lack of a pediatrician on the initial panel.
- One Committee member raised concern about the construct validity testing, stating that they did not agree that contact with a primary care provider was a comparable measure.
- In a continuation of earlier discussions about the timeframe for follow-up, the Committee expressed significant concern about the requirement for a face-to-face encounter for the first visit. The Committee noted that providers are being encouraged to use alternative ways to engage with patients (e.g., telehealth, including video conferencing, apps, and other modalities), especially as a way to save costs for patients with high-deductible plans. The developer responded that they are evaluating the use of telehealth in general across all of their measures, and that there is a recommendation currently out for comment to use video-conferencing in this particular measure. The developer also noted that telehealth is acceptable for one of the other two visits.
- The Committee did not pass the measure on the validity subcriterion.

3. Feasibility: N/A

(3a. Data generated during care; 3b. Electronic sources; and 3c. Data collection can be implemented (eMeasure feasibility assessment of data elements and logic)

4. Use and Usability: N/A

(4a. Accountability/transparency; and 4b. Improvement – progress demonstrated; and 4c. Benefits outweigh evidence of unintended negative consequences)

3172 Continuity of Pharmacotherapy for Alcohol Use Disorder

[Submission](#)

Description: Percentage of adults 18-64 years of age with pharmacotherapy for alcohol use disorder (AUD) who have at least 180 days of treatment and a Proportion of Days Covered (PDC) of at least 0.8

Numerator Statement: Individuals in the denominator who have at least 180 days of treatment and a PDC of at least 0.8 for AUD medications

Denominator Statement: Individuals 18-64 years of age who had a diagnosis of AUD and at least one claim for an AUD medication

Exclusions: There are no denominator exclusions.

Adjustment/Stratification: N/A

Level of Analysis: Health Plan, Population : Regional and State

Setting of Care: Clinician Office/Clinic, Behavioral Health : Outpatient

3172 Continuity of Pharmacotherapy for Alcohol Use Disorder

Type of Measure: Process

Data Source: Claims (Other), Pharmacy

Measure Steward: RAND Corporation

STANDING COMMITTEE MEETING 03/01/2017

1. Importance to Measure and Report: Did not meet the Importance criteria

(1a. Evidence: 1b. Performance Gap, 1c. High Priority)

1a. Evidence: **H-0; M-7; L-9; I-3**; 1b. Performance Gap: **N/A**

Rationale:

- The developer provided recommendations from the VA/DoD 2015 guideline on the management of substance use disorders regarding specific medications to offer for AUD.
- The Committee expressed concern about the evidence for the 180-day timeframe for continuation of medication. The developer noted the timeframe was based on FDA trial lengths.
- The Committee regarded the evidence on the individual medications to be of varied strength and quality, stating that some of the individual medications had little evidence to support the timeframe of the measure or even the efficacy of the medication itself. Committee members stated that often guidelines will suggest the use of medications for when everything else has failed.
- The Committee expressed concern that the medications are used to reduce the number of days of alcohol use, but do not necessarily help patients to stop using alcohol altogether. The Committee also noted that while the medications may lead to decreased alcohol use, relapses are not specifically associated with discontinuation of the medication.
- The Committee expressed concern that some of the medications are not approved by the FDA for alcohol use disorder. The developer stated that guidelines often support the off-label use of older medications, and that there will likely not be studies that would be required to go through the FDA process to get such approvals. The Committee also noted that some of the medications have other uses (e.g., gabapentin for neuropathy), and so patients using these medications for other reasons who appropriately stop taking those medications would be captured in this measure.
- The Committee also expressed concern that the evidence for using medication alone for alcohol use disorder is not strong (as it is for opioid use disorder). The Committee noted that cognitive-behavioral therapies can be equally effective, and they questioned the importance to measure medication use in isolation for alcohol use disorder. The developer noted that this measure does not question the choice to go on medication or not, but to say that if someone is prescribed a medication, there should be an effort to try to ensure adherence.

2. Scientific Acceptability of Measure Properties:

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **N/A** 2b. Validity: **N/A**

3. Feasibility: **N/A**

3207 Medication Reconciliation on Admission

[Submission](#)

Description: The average completeness of the medication reconciliation process within 48 hours of admission to an inpatient facility.

Numerator Statement: This measure does not have a traditional numerator. The numerator is a facility-level score of the completeness of the medication reconciliation process within 48 hours of admission. This score is calculated by averaging the scores of the three components of the medication reconciliation process. The components include:

- 1) Comprehensive prior to admission (PTA) medication information gathering and documentation
- 2) Completeness of critical PTA medication information
- 3) Reconciliation action for each PTA medication

Denominator Statement: The denominator for the composite measure includes admissions to an inpatient facility from home or a non-acute setting with a length of stay greater than or equal to 48 hours.

Exclusions: This measure does not have any denominator exclusions.

Adjustment/Stratification: N/A

Level of Analysis: Facility

Setting of Care: Behavioral Health : Inpatient

Type of Measure: Composite

Data Source: Other, Paper Records

Measure Steward: Centers for Medicare & Medicaid Services, Contracting Officer's Representative (COR)

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: **Did not meet the Importance criteria**

(1a. Evidence: 1b. Performance Gap, 1c. High Priority)

1a. Evidence: **H-1; M-6; L-15; I-1**; 1b. Performance Gap: **N/A**

Rationale:

- The developer provided evidence in the form of a 2012 systematic review of hospital-based medication reconciliation practices and individual related studies new since the systematic review. The developer also noted The Joint Commission National Patient Safety Goals for hospitals which includes a goal to "maintain and communicate accurate patient medical information." This goal specifically includes aspects related to medication information.
- The Committee expressed concern that the evidence was weak for this measure focus, noting that in the 2012 systematic review, only 6 of the 26 studies were rated as good quality. Further, the review did not

| 3207 Medication Reconciliation on Admission |
|--|
| <p>discriminate whether the reconciliation occurred at admission, transfer between units, or at discharge. The developer stated that studying medication errors and measuring preventable adverse drug events can be challenging.</p> <ul style="list-style-type: none"> The Committee also noted that while national organizations may say medication reconciliation is important, they do not see clear evidence that specifically links each of the components of the measure with enhanced outcomes. The developer stated the measure is consistent with The Joint Commission’s National Patient Safety Goals, but the Committee noted these are not evidenced based recommendations. Further, Committee members noted that studies of the medication reconciliation process are usually conducted in acute care facilities, and not in inpatient psychiatric facilities. Committee members recommended providing more evidence about how each of the components will lead to improvements |
| <p>2. Scientific Acceptability of Measure Properties: (2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity) 2a. Reliability: N/A. Validity: N/A</p> |

| 3229 Patient Panel Adult Smoking Prevalence |
|---|
| <p>Submission</p> |
| <p>Description: Percentage of adults (age 18 years or older) who are tobacco smokers at time of most recent encounter during the measurement period.</p> <p>Numerator Statement: Patients age 18 years and older who had a qualifying encounter with a provider during the measurement period AND were indicated as smokers as of the most recent qualifying encounter during the measurement period.</p> <p>Denominator Statement: Patients age 18 years and older who had a qualifying encounter with a provider during the measurement period AND were screened for smoking within 24 months prior to the measurement period end date AND screening occurred during or prior to the patient’s mo</p> <p>Exclusions: Patients were excluded if they were <18 years old. Additionally, they were excluded from being screened for smoking status if they had limited life expectancy, had a medical reason, or had smoking status missing (details in exclusion analysis Section 2b3).</p> <p>Adjustment/Stratification: N/A</p> <p>Level of Analysis: Clinician : Individual</p> |

3229 Patient Panel Adult Smoking Prevalence

Setting of Care: Clinician Office/Clinic, Other, Behavioral Health : Outpatient

Type of Measure: Outcome

Data Source: Electronic Health Record (Only)

Measure Steward: Centers for Medicare & Medicaid Services

STANDING COMMITTEE MEETING 02/28/2017

1. Importance to Measure and Report: The measure meets the Importance criteria

(1a. Evidence: 1b. Performance Gap, 1c. High Priority)

1a. Evidence: **H-9; M-10; L-3; I-1**; 1b. Performance Gap: **H-13; M-9; L-0; I-1**

Rationale:

- The Committee recognized the measure focus has a strong evidence base in the form of clinical practice guidelines, USPSTF recommendations, and a systematic review showing the overall evidence to be of high quality, quantity, and consistency. The Committee also found evidence that there are interventions that can impact the desired outcome (e.g., association between advice to quit and smokers actually quitting).
- The Committee noted variation in provider-level prevalence rates, ranging from 0.0 percent to 69.2 percent, and a mean prevalence of 13.2 percent. (Lower values are better in that they reflect a lower prevalence of smoking.)

2. Scientific Acceptability of Measure Properties: Did not meet the Scientific Acceptability criteria

(2a. Reliability - precise specifications, testing; 2b. Validity - testing, threats to validity)

2a. Reliability: **H-3; M-10; L-10; I-0**; 2b. Validity: **H-1; M-2; L-18; I-2**

Rationale:

- The developer demonstrated high reliability in testing (average reliability 0.899) when tested among providers who reported smoking status for at least 10 patients and at least 50 percent of all their patients.
- The Committee was concerned about the potential for providers to “game” the system; the measure excludes all patients who do not have a smoking status recorded. The Committee noted that providers might score well on the measure by not reporting smoking status for their smokers. The Committee further noted that 26.5 percent of patients were excluded in testing due to missing smoking status, and expressed concern for how this affected the validity of the measure, since the missing data could skew the results. The developers noted that this would cause the provider to score poorly on other measures related to screening, and the Committee suggested the measures might be combined to avoid such “gaming.”
- The Committee also expressed concern that providers would be punished for their patients relapses in spite of their efforts to encourage their patients to quit. They also raised issues about a patient’s smoking status being attributed to the most recent physician, even though the patient may have recently changed physicians.
- Several Committee members suggested the measure be reconfigured as a measure of percent change in smoking status, and the developer agreed this could be a direction to go in the future.
- The Committee expressed their support for this type of measure, noting it was an important first step toward a population-based outcome measure for smoking, but that more work was needed on the specifications to ensure validity.

Appendix E: Measure Specifications

| | 0027 Medical Assistance With Smoking and Tobacco Use Cessation |
|---------------------|---|
| Status | Submitted |
| Steward | National Committee for Quality Assurance |
| Description | <p>The three components of this measure assess different facets of providing medical assistance with smoking and tobacco use cessation:</p> <p>Advising Smokers and Tobacco Users to Quit: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who received advice to quit during the measurement year.</p> <p>Discussing Cessation Medications: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were recommended cessation medications during the measurement year.</p> <p>Discussing Cessation Strategies: A rolling average represents the percentage of patients 18 years of age and older who are current smokers or tobacco users and who discussed or were provided cessation methods or strategies during the measurement year.</p> |

|-----------------------|---|
| | <p>The number of patients in the denominator who indicated that their doctor or health provider discussed or provided methods and strategies other than medication to assist with quitting smoking or using tobacco by answering “Sometimes” or “Usually” or “Always” to CAHPS question Q49: “In the last 12 months, how often did your doctor or health provider discuss or provide methods and strategies other than medication to assist you with quitting smoking or using tobacco? Examples of methods and strategies are: telephone helpline, individual or group counseling, or cessation program.”</p> <p>Response options for all questions: Never, Sometimes, Usually, Always</p> <p>---</p> <p>For the Medicaid product line:</p> <p>- Advising Smokers and Tobacco Users to Quit:</p> <p>The number of patients in the denominator who indicated that they received advice to quit smoking or tobacco use from a doctor or other health provider by answering “Sometimes” or “Usually” or “Always” to CAHPS question Q40: “In the last 6 months, how often were you advised to quit smoking or using tobacco by a doctor or other health provider in your plan?”</p> <p>- Discussing Smoking Cessation Medications:</p> <p>The number of patients in the denominator who indicated that their doctor or health provider recommended or discussed medication to assist with quitting smoking or using tobacco by answering “Sometimes” or “Usually” or “Always” to CAHPS question Q41: “In the last 6 months, how often was medication recommended or discussed by a doctor or health provider to assist you with quitting smoking or using tobacco? Examples of medication are: nicotine gum, patch, nasal spray, inhaler, or prescription medication.”</p> <p>- Discussing Cessation Strategies:</p> <p>The number of patients in the denominator who indicated that their doctor or health provider discussed or provided methods and strategies other than medication to assist with quitting smoking or using tobacco by answering “Sometimes” or “Usually” or “Always” to CAHPS question Q42: “In the last 6 months, how often did your doctor or health provider discuss or provide methods and strategies other than medication to assist you with quitting smoking or using tobacco? Examples of methods and strategies are: telephone helpline, individual or group counseling, or cessation program.”</p> <p>Response options for all questions: Never, Sometimes, Usually, Always</p> <p>---</p> <p>For the Medicare product line:</p> <p>- Advising Smokers or Tobacco Users to Quit</p> <p>The number of patients in the denominator who indicated that they received advice to quit smoking or using tobacco from a doctor or other health provider by answering “Sometimes” or “Usually” or “Always” to CAHPS question Q66 : “In the last 6 months, how often were you advised to quit smoking or using tobacco by a doctor or other health provider in your plan?”</p> <p>Response options for all questions: Never, Sometimes, Usually, Always, I had no visits in the last 6 months</p> |
| Denominator Statement | Patients 18 years and older who responded to the CAHPS survey and indicated that they were current smokers or tobacco users during the measurement year or in the last 6 months for Medicaid and Medicare. |
| Denominator Details | In order to be included in the denominator for each rate, patients must answer both the question about current cigarette/tobacco use and the relevant numerator question (eg, for the Advising Smokers and Tobacco Users to Quit rate, patients must answer the question |

0027 Medical Assistance With Smoking and Tobacco Use Cessation

about current cigarette/tobacco use and the question about how often they were advised to quit by a doctor or other health provider).

For the commercial product line:

- Advising Smokers and Tobacco Users to Quit

The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering "Every day" or "Some days" to CAHPS question Q46 and by answering Q47 with any response ("Never" or "Sometimes" or "Usually" or "Always").

Q46: "Do you now smoke cigarettes or use tobacco every day, some days, or not at all?"

Response options for Q46: "Every day", "Some days", "Not at all", "Don't know"

Q47: "In the last 12 months, how often were you advised to quit smoking or using tobacco by a doctor or other health provider in your plan?"

Response options for Q47: "Never", "Sometimes", "Usually", "Always"

- Discussing Cessation Medications

The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering "Every day" or "Some days" to CAHPS question Q46 and by answering Q48 with any response ("Never" or "Sometimes" or "Usually" or "Always").

Q46: "Do you now smoke cigarettes or use tobacco every day, some days, or not at all?"

Response options for Q46: "Every day", "Some days", "Not at all", "Don't know"

Q48: "In the last 12 months, how often was medication recommended or discussed by a doctor or health provider to assist you with quitting smoking or using tobacco? Examples of medication are: nicotine gum, patch, nasal spray, inhaler, or prescription medication."

Response options for Q48: "Never" OR "Sometimes" OR "Usually" OR "Always"

- Discussing Cessation Strategies

The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering "Every day" or "Some days" to CAHPS question Q46 and by answering Q49 with any response ("Never" or "Sometimes" or "Usually" or "Always").

Q46: "Do you now smoke cigarettes or use tobacco every day, some days, or not at all?"

Response options for Q46: "Every day", "Some days", "Not at all", "Don't know"

Q49: "In the last 12 months, how often did your doctor or health provider discuss or provide methods and strategies other than medication to assist you with quitting smoking or using tobacco? Examples of methods and strategies are: telephone helpline, individual or group counseling, or cessation program."

Response options for Q49: "Never", "Sometimes", "Usually", "Always"

For the Medicaid product line:

- Advising Smokers and Tobacco Users to Quit

The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering "Every day" or "Some days" to CAHPS question Q39 and by answering Q40 with any response ("Never" or "Sometimes" or "Usually" or "Always").

Q39: "Do you now smoke cigarettes or use tobacco every day, some days, or not at all?"

Response options for Q39: "Every day", "Some days", "Not at all", "Don't know"

Q40: "In the last 6 months, how often were you advised to quit smoking or using tobacco by a doctor or other health provider in your plan?"

Response options for Q40: "Never", "Sometimes", "Usually", "Always"

- Discussing Cessation Medications

The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering "Every day" or "Some days" to CAHPS question Q39

| 0027 Medical Assistance With Smoking and Tobacco Use Cessation | |
|---|---|
| | <p>and by answering Q41 with any response (“Never” or “Sometimes” or “Usually” or “Always”).</p> <p>Q39: “Do you now smoke cigarettes or use tobacco every day, some days, or not at all?”</p> <p>Response options for Q39: “Every day”, “Some days”, “Not at all”, “Don’t know”</p> <p>Q41: “In the last 6 months, how often was medication recommended or discussed by a doctor or health provider to assist you with quitting smoking or using tobacco? Examples of medication are: nicotine gum, patch, nasal spray, inhaler, or prescription medication.”</p> <p>Response options for Q41: “Never”, “Sometimes”, “Usually”, “Always”</p> <p>- Discussing Cessation Strategies</p> <p>The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering “Every day” or “Some days” to CAHPS question Q39 and by answering Q42 with any response (“Never” or “Sometimes” or “Usually” or “Always”).</p> <p>Q39: “Do you now smoke cigarettes or use tobacco every day, some days, or not at all?”</p> <p>Response options for Q39: “Every day”, “Some days”, “Not at all”, “Don’t know”</p> <p>Q42: “In the last 6 months, how often did your doctor or health provider discuss or provide methods and strategies other than medication to assist you with quitting smoking or using tobacco? Examples of methods and strategies are: telephone helpline, individual or group counseling, or cessation program.”</p> <p>Response options for Q42: “Never”, “Sometimes”, “Usually”, “Always”</p> <p>---</p> <p>For the Medicare product line:</p> <p>- Advising Smokers or Tobacco Users to Quit</p> <p>The number of patients who responded to the survey and indicated that they were current smokers or tobacco users by answering “Every day” or “Some days” to CAHPS question Q65, had one or more visits during the last 6 months, and by answering Q66 with any response (“Never” or “Sometimes” or “Usually” or “Always”).</p> <p>Q65: “Do you now smoke cigarettes or use tobacco every day, some days, or not at all?”</p> <p>Response options for Q65: “Not at all”, “Some days”, “Every day”, “Don’t know”</p> <p>Q66: “In the last 6 months, how often were you advised to quit smoking or using tobacco by a doctor or other health provider in your plan?”</p> <p>Response options for Q66: “Never”, “Sometimes”, “Usually”, “Always”, “I had no visits in the last 6 months”</p> <p>The Medicare results for the Advising Smokers and Tobacco Users to Quit Rate requires a minimum denominator of at least 30 responses.</p> |
| Exclusions | None |
| Exclusion details | N/A |
| Risk Adjustment | No risk adjustment or risk stratification 123834 140881 123834 140881 |
| Stratification | None |
| Type Score | Rate/proportion better quality = higher score |
| Algorithm | <p>Step 1: Identify the eligible population of commercial, Medicaid and Medicare CAHPS respondents</p> <p>Step 2: Identify the denominator for each component.</p> <p>Step 3: Identify the numerator for each component.</p> <p>Step 4: Calculate the rate as numerator/denominator.</p> <p>For the commercial and Medicaid product lines, rolling averages are calculated using the</p> |

| | |
|------------------------|--|
| | 0027 Medical Assistance With Smoking and Tobacco Use Cessation |
| | <p>formula below.</p> $\text{Rate} = (\text{Year 1 Numerator} + \text{Year 2 Numerator}) / (\text{Year 1 Denominator} + \text{Year 2 Denominator})$ <p>NCQA calculates a result when the denominator is 100 individuals or more.</p> <p>If the health plan did not report results in the prior year (Year 1), but reports results for the current year and achieves a denominator of 100 or more, NCQA calculates a rate.</p> <p>For the Medicare product line, this is collected by the Centers for Medicare & Medicaid Services through the Medicare CAHPS Survey. This is collected on an annual basis. 123834 140881</p> |
| Copyright / Disclaimer | <p>© 2012 by the National Committee for Quality Assurance</p> <p>1100 13th Street, NW, Suite 1000</p> <p>Washington, DC 20005</p> |

| | |
|---------------------|---|
| | 0576 Follow-Up After Hospitalization for Mental Illness (FUH) |
| Status | Submitted |
| Steward | National Committee for Quality Assurance |
| Description | <p>The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are reported:</p> <ul style="list-style-type: none"> - The percentage of discharges for which the patient received follow-up within 30 days of discharge - The percentage of discharges for which the patient received follow-up within 7 days of discharge. |
| Type | Process |
| Data Source | <p>Claims (Only) This measure is based on administrative claims collected in the course of providing care to health plan members. NCQA collects the Healthcare Effectiveness Data and Information Set (HEDIS) data for this measure directly from Health Management Organizations and Preferred Provider Organizations via NCQA's online data submission system.</p> <p>No data collection instrument provided Attachment 0576_FUH_Value_Sets.xlsx</p> |
| Level | Health Plan, Integrated Delivery System |
| Setting | Clinician Office/Clinic, Behavioral Health : Inpatient, Behavioral Health : Outpatient |
| Numerator Statement | <p>30-Day Follow-Up: A follow-up visit with a mental health practitioner within 30 days after discharge.</p> <p>7-Day Follow-Up: A follow-up visit with a mental health practitioner within 7 days after discharge.</p> |
| Numerator Details | <p>For both indicators, a follow-up visit includes outpatient visits, intensive outpatient visits or partial hospitalizations that occur on the date of discharge. Any of the following meet criteria for a follow-up visit:</p> <ul style="list-style-type: none"> - A visit (FUH Stand Alone Visits Value Set; FUH Visits Group 1 Value Set and FUH POS Group 1 Value Set; FUH Visits Group 2 Value Set and FUH POS Group 2 Value Set) with a mental health practitioner (see definition below). - A visit to a behavioral healthcare facility (FUH RevCodes Group 1 Value Set). - A visit to a non-behavioral healthcare facility (FUH RevCodes Group 2 Value Set) with a |

| | 0576 Follow-Up After Hospitalization for Mental Illness (FUH) |
|-----------------------|--|
| | <p>mental health practitioner.</p> <ul style="list-style-type: none"> - A visit to a non-behavioral healthcare facility (FUH RevCodes Group 2 Value Set) with a diagnosis of mental illness (Mental Illness Value Set). - Transitional care management services (TCM 7 Day Value Set). <p>The following meets criteria for only the 30-Day Follow-Up indicator:</p> <ul style="list-style-type: none"> - Transitional care management services (TCM 14 Day Value Set) <p>(See corresponding Excel document for the value sets referenced above)</p> <p>Mental Health Practitioner Definition:</p> <p>A practitioner who provides mental health services and meets any of the following criteria:</p> <ul style="list-style-type: none"> • An MD or doctor of osteopathy (DO) who is certified as a psychiatrist or child psychiatrist by the American Medical Specialties Board of Psychiatry and Neurology or by the American Osteopathic Board of Neurology and Psychiatry; or, if not certified, who successfully completed an accredited program of graduate medical or osteopathic education in psychiatry or child psychiatry and is licensed to practice patient care psychiatry or child psychiatry, if required by the state of practice. • An individual who is licensed as a psychologist in his/her state of practice, if required by the state of practice. • An individual who is certified in clinical social work by the American Board of Examiners; who is listed on the National Association of Social Worker’s Clinical Register; or who has a master’s degree in social work and is licensed or certified to practice as a social worker, if required by the state of practice. • A registered nurse (RN) who is certified by the American Nurses Credentialing Center (a subsidiary of the American Nurses Association) as a psychiatric nurse or mental health clinical nurse specialist, or who has a master’s degree in nursing with a specialization in psychiatric/mental health and two years of supervised clinical experience and is licensed to practice as a psychiatric or mental health nurse, if required by the state of practice. • An individual (normally with a master’s or a doctoral degree in marital and family therapy and at least two years of supervised clinical experience) who is practicing as a marital and family therapist and is licensed or a certified counselor by the state of practice, or if licensure or certification is not required by the state of practice, who is eligible for clinical membership in the American Association for Marriage and Family Therapy. • An individual (normally with a master’s or doctoral degree in counseling and at least two years of supervised clinical experience) who is practicing as a professional counselor and who is licensed or certified to do so by the state of practice, or if licensure or certification is not required by the state of practice, is a National Certified Counselor with a Specialty Certification in Clinical Mental Health Counseling from the National Board for Certified Counselors (NBCC). |
| Denominator Statement | Discharges from an acute inpatient setting (including acute care psychiatric facilities) with a principal diagnosis of mental illness during the first 11 months of the measurement year (i.e., January 1 to December 1) for patients 6 years and older. |
| Denominator Details | <p>An acute inpatient discharge with a principal diagnosis of mental illness (Mental Illness Value Set) on or between January 1 and December 1 of the measurement year.</p> <p>To identify acute inpatient discharges:</p> <ol style="list-style-type: none"> 1. Identify all acute and nonacute inpatient stays (Inpatient Stay Value Set). 2. Exclude nonacute inpatient stays (Nonacute Inpatient Stay Value Set). 3. Identify the discharge date for the stay. <p>The denominator for this measure is based on discharges, not on patients. If patients have more than one discharge, include all discharges on or between January 1 and December 1 of</p> |

| | 0576 Follow-Up After Hospitalization for Mental Illness (FUH) |
|-------------------|---|
| | <p>the measurement year.</p> <p>Acute facility readmission or direct transfer: If the discharge is followed by readmission or direct transfer to an acute inpatient care setting for a principal diagnosis of mental health (Mental Health Diagnosis Value Set) within the 30-day follow-up period, count only the last discharge.</p> <p>To identify readmissions to an acute inpatient care setting:</p> <ol style="list-style-type: none"> 1. Identify all acute and nonacute inpatient stays (Inpatient Stay Value Set). 2. Exclude nonacute inpatient stays (Nonacute Inpatient Stay Value Set). 3. Identify the admission date for the stay. <p>*Due to the extensive volume of codes associated with identifying the denominator for this measure, we are attaching a separate file with value sets. See value sets located in question S.2b.</p> |
| Exclusions | <p>Exclude from the denominator for both rates, patients who receive hospice services during the measurement year.</p> <p>Exclude both the initial discharge and the readmission/direct transfer discharge if the readmission/direct transfer discharge occurs after December 1 of the measurement year.</p> <p>Exclude discharges followed by readmission or direct transfer to a nonacute facility within the 30-day follow-up period regardless of principal diagnosis.</p> <p>Exclude discharges followed by readmission or direct transfer to an acute facility within the 30-day follow-up period if the principal diagnosis was for non-mental health.</p> <p>These discharges are excluded from the measure because rehospitalization or transfer may prevent an outpatient follow-up visit from taking place.</p> |
| Exclusion details | <p>Exclude patients who use hospice services or elect to use a hospice benefit any time during the measurement year, regardless of when the services began. These patients may be identified using various methods, which may include but are not limited to enrollment data, medical record or claims/encounter data (Hospice Value Set).</p> <p>Exclude both the initial discharge and the readmission/direct transfer discharge if the last discharge occurs after December 1 of the measurement year.</p> <p>Exclude discharges followed by readmission or direct transfer to a nonacute care setting within the 30-day follow-up period, regardless of principal diagnosis for the readmission. To identify readmissions to a nonacute inpatient care setting:</p> <ol style="list-style-type: none"> 1. Identify all acute and nonacute inpatient stays (Inpatient Stay Value Set). 2. Confirm the stay was for nonacute care based on the presence of a nonacute code (Nonacute Inpatient Stay Value Set) on the claim. 3. Identify the admission date for the stay. <p>Exclude discharges followed by readmission or direct transfer to an acute inpatient care setting within the 30-day follow-up period if the principal diagnosis was for non-mental health (any principal diagnosis code other than those included in the Mental Health Diagnosis Value Set). To identify readmissions to an acute inpatient care setting:</p> <ol style="list-style-type: none"> 1. Identify all acute and nonacute inpatient stays (Inpatient Stay Value Set). 2. Exclude nonacute inpatient stays (Nonacute Inpatient Stay Value Set). 3. Identify the admission date for the stay. <p>These discharges are excluded from the measure because rehospitalization or transfer may prevent an outpatient follow-up visit from taking place.</p> <p>- See corresponding Excel document for the Value Sets referenced above in S.2b.</p> |
| Risk Adjustment | No risk adjustment or risk stratification |

| | 3132 Preventive Care and Screening: Screening for Depression and Follow-Up Plan |
| Status | Submitted |
| Steward | Centers for Medicare & Medicaid Services |
| Description | Percentage of patients aged 12 years and older screened for depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen |
| Type | Process |
| Data Source | Electronic Health Record (Only) No specific data source/data collection instrument. No data collection instrument provided Attachment NQF_0418_Coding_Table_S2b_CMS_2.xlsx |
| Level | Clinician : Group/Practice, Clinician : Individual |
| Setting | Clinician Office/Clinic |
| Numerator Statement | Patients screened for depression on the date of the encounter using an age appropriate standardized tool AND if positive, a follow-up plan is documented on the date of the positive screen |
| Numerator Details | <p>Within the eMeasure specification, value sets contain various codes to indicate clinical quality actions. (See attached code table for S2.b)</p> <p>Definitions included in relation to the numerator include the following:</p> <p>Screening – Completion of a clinical or diagnostic tool used to identify people at risk of developing or having a certain disease or condition, even in the absence of symptoms.</p> <p>Standardized Depression Screening Tool – A normalized and validated depression screening tool developed for the patient population in which it is being utilized. Examples of adolescent depression screening tools (12 – 17 years) include but are not limited to: Patient Health Questionnaire for Adolescents (PHQ-A), Beck Depression Inventory-Primary Care Version (BDI-PC), Mood Feeling Questionnaire (MFQ), Center for Epidemiologic Studies Depression Scale (CES-D), Patient Health Questionnaire (PHQ-9), Pediatric Symptom Checklist (PSC-17), PRIME MD-PHQ2.</p> <p>Examples of adult depression screening tools (18 years and older) include but are not limited</p> |

3132 Preventive Care and Screening: Screening for Depression and Follow-Up Plan

to Patient Health Questionnaire (PHQ9), Beck Depression Inventory (BDI or BDI-II), Center for Epidemiologic Studies Depression Scale (CES-D), Depression Scale (DEPS), Duke Anxiety-Depression Scale (DADS), Geriatric Depression Scale (GDS), Cornell Scale Screening, PRIME MD-PHQ2.

Follow-Up Plan - Documented follow-up for a positive depression screening must include one or more of the following:

- Additional evaluation for depression
- Suicide Risk Assessment
- Referral to a practitioner who is qualified to diagnose and treat depression
- Pharmacological interventions
- Other interventions or follow-up for the diagnosis or treatment of depression

The measure specification defines the numerator as:

AND:

- OR:
 - o AND: Most Recent: "Occurrence A of Risk Category Assessment: Adolescent Depression Screening (result)" during ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period")
 - o AND: "Occurrence A of Risk Category Assessment: Adolescent Depression Screening (result: Negative Depression Screening)"
 - o AND: Age < 18 year(s) at: "Measurement Period"
- OR:
 - o AND: Most Recent: "Occurrence A of Risk Category Assessment: Adolescent Depression Screening (result)" during ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period")
 - o AND: "Occurrence A of Risk Category Assessment: Adolescent Depression Screening (result: Positive Depression Screening)"
 - o AND: Union of:
 - "Intervention, Performed: Additional evaluation for depression - adolescent"
 - "Intervention, Order: Referral for Depression Adolescent"
 - "Medication, Order: Depression medications - adolescent"
 - "Intervention, Performed: Follow-up for depression - adolescent"
 - "Procedure, Performed: Suicide Risk Assessment"
 - <= 1 day(s) starts after or concurrent with start of "Occurrence A of Risk Category Assessment: Adolescent Depression Screening"
 - o AND: Age < 18 year(s) at: "Measurement Period"
- OR:
 - o AND: Most Recent: "Occurrence A of Risk Category Assessment: Adult Depression Screening (result)" during ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period")
 - o AND: "Occurrence A of Risk Category Assessment: Adult Depression Screening (result: Negative Depression Screening)"
 - o AND: Age >= 18 year(s) at: "Measurement Period"
- OR:
 - o AND: Most Recent: "Occurrence A of Risk Category Assessment: Adult Depression Screening (result)" during ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period")
 - o AND: "Occurrence A of Risk Category Assessment: Adult Depression Screening (result:

| | 3132 Preventive Care and Screening: Screening for Depression and Follow-Up Plan |
|-----------------------|---|
| | Positive Depression Screening)" <ul style="list-style-type: none"> o AND: Union of: <ul style="list-style-type: none"> "Intervention, Performed: Additional evaluation for depression - adult" "Intervention, Order: Referral for Depression Adult" "Medication, Order: Depression medications - adult" "Intervention, Performed: Follow-up for depression - adult" "Procedure, Performed: Suicide Risk Assessment" <= 1 day(s) starts after or concurrent with start of "Occurrence A of Risk Category Assessment: Adult Depression Screening" AND: Age >= 18 year(s) at: "Measurement Period" |
| Denominator Statement | All patients aged 12 years and older before the beginning of the measurement period with at least one eligible encounter during the measurement period |
| Denominator Details | Within the eMeasure, the denominator is defined as the initial patient population, which the specification defines as: "Patient Characteristic Birthdate: birth date" >= 12year(s) starts before start of "Measurement Period" AND: "Occurrence A of Encounter, Performed: Depression Screening Denominator Encounter Codes" (See attached code table for S2.b for specific value set codes included) |
| Exclusions | Patients with an active diagnosis for Depression or a diagnosis of Bipolar Disorder are excluded. Patients with any of the following are excepted: patient reason(s), patient refuses to participate, or medical reason(s); patient is in an urgent or emergent situation where time is of the essence and to delay treatment would jeopardize the patient's health status; or situations where the patient's functional capacity or motivation to improve may impact the accuracy of results of standardized depression assessment tools (for example: certain court appointed cases or cases of delirium). |
| Exclusion details | Within the eMeasure specification, value sets contain relevant codes to capture the exclusions. (See attached code table for S2.b for specific coding). The specification defines denominator exclusions as: OR "Diagnosis: Depression diagnosis" satisfies all: <ul style="list-style-type: none"> • starts before start of ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period") • overlaps ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period") OR "Diagnosis: Bipolar diagnosis" satisfies all: <ul style="list-style-type: none"> • starts before start of ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period") • overlaps ("Encounter, Performed: Depression Screening Encounter Codes" during "Measurement Period") The specification defines denominator exceptions as: OR: <ul style="list-style-type: none"> • AND: Union of: <ul style="list-style-type: none"> o "Risk Category Assessment not done: Medical or Other reason not done" for "Adolescent Depression Screening" o "Risk Category Assessment not done: Patient Reason refused" for "Adolescent Depression Screening" o during "Encounter, Performed: Depression Screening Encounter Codes" • AND NOT: "Risk Category Assessment: Adolescent Depression Screening" during |

| | 3175 Continuity of Pharmacotherapy for Opioid Use Disorder |
| Status | Submitted |
| Steward | RAND Corporation |
| Description | Percentage of adults 18-64 years of age with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment |
| Type | Process |
| Data Source | <p>Claims (Other), Pharmacy For measure calculation, the following files from the Truven MarketScan® Commercial Database were used:</p> <ul style="list-style-type: none"> • Enrollment data • Drug claims • Medical claims <p>We used data from these files (including data from Standard Quarterly Updates) for calendar years 2010-2015. This database has long been a commonly used data source to study patterns of commercially insured patients. The database contains fully adjudicated, patient-level claims. All records in these files were used as input to identify individuals that met the measure’s eligibility criteria. We present detailed results in the MIF for 2013-2014, as we have the most data for this time period, but we include measure scores for each of the two-year</p> |

| | 3175 Continuity of Pharmacotherapy for Opioid Use Disorder |
|---------------------|---|
| | <p>periods within 2010-2015. The final analytic file for 2013-2014 contained a total of 43,812 episodes.</p> <p>No data collection instrument provided Attachment NQF_3175_OUD_Code_Lists_1-12-17_To_NQF.xlsx</p> |
| Level | Health Plan, Population : Regional and State |
| Setting | Clinician Office/Clinic, Behavioral Health : Outpatient |
| Numerator Statement | Individuals in the denominator who have at least 180 days of continuous pharmacotherapy with a medication prescribed for OUD without a gap of more than seven days |
| Numerator Details | <p>The measure numerator is calculated based on commercial claims data for rolling two-year periods from 2010 to 2015: 2010-2011, 2011-2012, 2012-2013, 2013-2014, and 2014-2015. The measure numerator is defined as individuals in the denominator with at least 180 days of “continuous pharmacotherapy” with an OUD medication.</p> <p>Continuous pharmacotherapy for OUD is identified on the basis of the days covered by the days’ supply of all prescription claims for any OUD medication (see list below) or number of days for which the drug was dispensed in a physician office or treatment center with the exceptions noted in this paragraph. The period of continuous pharmacotherapy starts on the day the first claim for an OUD medication is filled/supplied (index date) and lasts through the days’ supply of the last claim for an OUD medication. To meet the 180-day requirement and be eligible for the measure, the date on the first claim for an OUD medication must fall at least 180 days before the end of the measurement period. For claims with a days’ supply that extends beyond the end of the measurement period, count only the days for which the drug was available to the individual during the measurement period. If two or more prescription claims occur on the same day or overlap, the surplus based on the days’ supplies accumulates over all prescriptions. However, if another claim is submitted after a claim for an injectable OUD medication or an oral OUD medication that is dispensed in an office or treatment center, the surplus from the day’s supply for the injectable or office-dispensed medication is not retained.</p> <p>An individual is considered to have continuous pharmacotherapy with OUD medication if there is no treatment gap of more than seven days. A gap is defined as a period during which the individual does not have oral OUD medication available based on the days’ supply, or is more than 7 days overdue for having an injection of an extended-release OUD medication.</p> <p>OUD medications were identified using National Drug Codes (NDCs) for the following:</p> <ul style="list-style-type: none"> • Buprenorphine • Naltrexone (oral) • Buprenorphine and Naloxone <p>And HCPCS codes for the following:</p> <ul style="list-style-type: none"> • Buprenorphine or Buprenorphine/naloxone, oral • Methadone administration • Naltrexone (extended-release injectable) <p>The National Drug Codes (NDCs) for the oral medications and the HCPCS codes for the injectable medications and office-dispensed oral medications (methadone and buprenorphine/naloxone) are contained in the sheets called “NDCs” and “HCPCS Codes”, respectively, in the Excel file called “NQF 3175 OUD Code Lists” which is attached to this form under Item S.2b. Note that the NDC code list DOES NOT include NDC codes for methadone, as it can legally only be dispensed as OUD pharmacotherapy in licensed treatment centers. Buprenorphine can be dispensed through a pharmacy or in an office and is therefore identified based on either NDC or HCPCS codes.</p> <p>Justification of Measure Definition: We define treatment continuity as (1) receiving at least</p> |

3175 Continuity of Pharmacotherapy for Opioid Use Disorder

180 days of treatment and (2) no gaps in medication use of more than 7 days.

Our definition of minimum duration is based on the fact that the FDA registration trials for OUD drugs studied the effect of treatment over three to six months (US FDAa, undated; US FDAb, undated), and we have no evidence for effectiveness of shorter durations. In addition, several recommendations support a minimum six-month treatment period as the risk of relapse is the highest in the first 6-12 months after start of opioid abstinence (US FDAa, undated; US FDAb, undated; US DHHS, 2015). Longer treatment duration is associated with better outcomes compared to shorter treatments and the best outcomes have been observed among patients in long-term methadone maintenance programs (“Effective medical treatment of opiate addiction”, 1998; Gruber et al., 2008; Moos et al., 1999; NIDA, 1999; Ouimette et al., 1998; Peles et al., 2013). Studies with long-term follow-up suggest that ongoing pharmacotherapy is associated with improved odds of opioid abstinence (Hser et al., 2015; Weiss et al., 2015). We did not specify a maximum duration of treatment, as no upper limit for duration of treatment has been empirically established (US DHHS, 2015).

We opted for using a treatment gap of more than seven days in our definition, given that the measure includes three active ingredients with different pharmacological profiles. There is substantial evidence for an elevated mortality risk immediately after treatment cessation (Cornish et al., 2010; Cousins et al., 2016; Davoli et al, 2007; Degenhardt et al., 2009; Gibson & Degenhardt, 2007; Pierce et al., 2016). Research suggests that methadone tolerance is lost after three days and this three-day threshold has been used in other observational methadone studies and in developing a United Kingdom treatment guideline which recommends reevaluating patients for intoxication and withdrawal after a three-day methadone treatment gap (Cousins et al., 2016; Cousins et al., 2011; “Drug Misuse and Dependence—Guidelines on Clinical Management”, 1999). Across all the medications, the mortality risk is highest in the first four weeks out of treatment, with many studies showing an increase in mortality in days 1-14 after treatment cessation.

| Denominator Statement | Individuals 18-64 years of age who had a diagnosis of OUD and at least one claim for an OUD medication |
| Denominator Details | <p>The measure denominator is calculated for rolling two-year periods from 2010 to 2015: 2010-2011, 2011-2012, 2012-2013, 2013-2014, and 2014-2015. The denominator includes individuals 18-64 years of age during their treatment period who had a diagnosis code of OUD during an inpatient, intensive outpatient, partial hospitalization, outpatient, detoxification or emergency department encounter at any time during the measurement period. To meet the 180-day requirement and be eligible for the measure, the date on the first claim for an OUD medication must fall at least 180 days before the end of the measurement period.</p> <p>The diagnosis codes used to identify individuals with OUD included:</p> <ul style="list-style-type: none"> • ICD-9: 304.0x, 305.5x • ICD-10: F11.xxx <p>These codes and descriptions are contained in the sheets called "ICD-9 Diagnosis Codes" and "ICD-10 Diagnosis Codes" in the Excel file called "NQF 3175 OUD Code Lists" which is attached to this form under Item S.2b.</p> <p>OUD medications were identified using National Drug Codes (NDCs) for the following:</p> |

| | 3175 Continuity of Pharmacotherapy for Opioid Use Disorder |
|-------------------|--|
| | <ul style="list-style-type: none"> • Buprenorphine • Naltrexone (oral) • Buprenorphine and Naloxone <p>And HCPCS codes for the following:</p> <ul style="list-style-type: none"> • Buprenorphine or Buprenorphine/naloxone, oral • Methadone administration • Naltrexone (extended-release injectable) <p>The National Drug Codes (NDCs) for the oral medications and the HCPCS codes for the injectable medications and office-or treatment-center dispensed oral medications (methadone and buprenorphine) are contained in the sheets called “NDCs” and “HCPCS Codes”, respectively, in the Excel file called “NQF 3175 OUD Code Lists” which is attached to this form under Item S.2b. Note that the NDC code list DOES NOT include NDC codes for methadone, as it can legally only be dispensed as OUD pharmacotherapy in licensed treatment centers. Buprenorphine can be dispensed through a pharmacy or in an office/treatment center and is therefore identified based on either NDC or HCPCS codes.</p> |
| Exclusions | There are no denominator exclusions. |
| Exclusion details | There are no denominator exclusions. |
| Risk Adjustment | No risk adjustment or risk stratification 123001 123001 |
| Stratification | Measure results may be stratified by: <ul style="list-style-type: none"> • Age – Divided into four categories: 18-34, 35-44, 45-54, 55-64 years • Gender: Male, Female • State • Health plan |
| Type Score | Rate/proportion better quality = higher score |
| Algorithm | <p>The measure score is calculated for rolling two-year periods from 2010 to 2015. The steps described below are repeated for five rolling two-year periods: 2010-2011, 2011-2012, 2012-2013, 2013-2014, and 2014-2015. We present detailed results in the MIF for 2013-2014, as we have the most data for this time period, but we include measure scores for each of the two-year periods within 2010-2015.</p> <p>DENOMINATOR: Individuals 18-64 years of age who had a diagnosis of OUD and at least one claim for an OUD medication</p> <p>CREATE DENOMINATOR:</p> <ol style="list-style-type: none"> 1. For each two-year period, identify individuals who are 18-64 years of age for the duration of the first year during which they appear in the period. 2. Of individuals identified in Step 1, keep those who had at least one encounter with any diagnosis (primary or secondary) of OUD in an outpatient setting, acute inpatient setting, or emergency department setting at any time during the two-year measurement period. The OUD diagnosis codes with descriptions are contained in the sheets called “ICD-9 Diagnosis Codes” and “ICD-10 Diagnosis Codes” in the Excel file called “NQF 3175 OUD Code Lists”, which is attached to this form under Item S.2b. 3. Of individuals identified in Step 2, keep those who have at least one claim with a National Drug Code (NDC) for any of the following oral OUD medications during the two-year period with a date at least 180 days before the end of the final calendar year of the measurement period: |

3175 Continuity of Pharmacotherapy for Opioid Use Disorder

- Buprenorphine
- Naltrexone (oral)
- Buprenorphine and Naloxone

Or a HCPCS code for any of the following OUD medications:

- Buprenorphine or Buprenorphine/naloxone, oral
- Methadone administration
- Naltrexone (extended-release injectable)

Claims for oral medications with negative, missing, or zero days' supply were not included. The NDCs for the oral medications and the HCPCS codes for the injectable and office- or treatment center-dispensed medications are contained in the sheets called "NDCs" and "HCPCS Codes", respectively, in the Excel file called "NQF 3175 OUD Code Lists," which is attached to this form under Item S.2b.

4. Of individuals identified in Step 3, keep individuals who were continuously enrolled in a commercial health plan captured by our data for at least 6 months after the month with the first OUD medication claim in the measurement period, with no gap in enrollment. Individuals who are not enrolled for 6 months, including those who die during the period, are not eligible and are not included in the analysis. This is the denominator.

NUMERATOR: Individuals in the denominator who have at least 180 days of continuous pharmacotherapy with a medication prescribed for OUD without a gap of more than seven days

CREATE NUMERATOR:

For the individuals in the denominator, identify those who have at least 180 days of continuous pharmacotherapy with an OUD medication without a gap of more than seven days using the following method:

1. Determine the number of days for the PDC denominator. The start date is the service date (fill date) of the first prescription or injection/dispensing claim for an OUD medication in the two-year measurement period. The end date is defined as the earliest of:

- The date on which the individual exhausts their days' supply, including any pre-existing surplus, following their final claim (assuming daily use).
- The individual's death date.
- December 31st of the second year in the two-year period.

2. For each individual: Count the days during the observation period for which the individual was covered by at least one OUD medication based on the prescription drug or injection/dispensing claim service dates and days' supply.

2a. Sort OUD medication claims by individual's ID and service date. Scan the claims in order, calculating a rolling surplus which accumulates any remaining days' supply from other prior or same-day fills.

2b. Naltrexone injections contribute 30 days' supply unless another claim is found sooner, in which case the Naltrexone injection covers only the days up to the next claim.

2c. Methadone and buprenorphine/naloxone supply is determined by the start and end dates on the outpatient claims with the codes for in-office/treatment center dispensation of methadone (H0020) and buprenorphine/naloxone (J0571-J0575).

2d. Claims for Naltrexone injections and for licensed treatment center-dispensed methadone and office-dispensed buprenorphine/naloxone are not added to the surplus supply and only one such claim per day is counted.

2e. For claims with a days' supply that extends beyond the end of the measurement period, count only the days for which the drug was available to the individual during the measurement period.

| | |
|------------------------|--|
| | 3175 Continuity of Pharmacotherapy for Opioid Use Disorder |
| | <p>3. Determine treatment gaps as periods, in which the individual has exhausted his/her available supply, defined as the days' supply from the most recent previous fill/dispensing and any pre-existing surplus available before that fill/dispensing.</p> <p>4. Of the individuals in Step 2, count the number of individuals who have a period of 180 days or greater from the start date of the first claim for OUD medication to the end date of the last claim for OUD medication within the two-year period and who do not have a gap of more than seven days without OUD medication available. This is the numerator.</p> <p>CALCULATE MEASURE SCORE:</p> <p>1. Calculate the measure score by dividing the numerator by the denominator.</p> <p>2. Calculate the measure score for each state. The state code on the claim record is used to identify individuals in each state. The measure score is then reported for each state that has at least 20 individuals in the denominator.</p> <p>3. Calculate the measure score for each health plan. Health plan membership is approximated based on a combination of two variables found on the claim record, industry type and Metropolitan Statistical Area (MSA). A health plan identifier is assigned based on each unique combination of industry and MSA. The health plan identifier is used to group individuals into health plans. The measure score is then reported for each health plan that has at least 20 individuals in the denominator. 123001</p> |

| | |
|---------------------|---|
| | 3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention |
| Status | Submitted |
| Steward | PCPI Foundation |
| Description | Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation intervention if identified as a tobacco user |
| Type | Process |
| Data Source | Electronic Health Record (Only) Not applicable. No data collection instrument provided Attachment EP_CMS138v5_NQF0028_ValueSets_20160401.xlsx |
| Level | Clinician : Group/Practice, Clinician : Individual |
| Setting | Clinician Office/Clinic, Home Health, Other, Behavioral Health : Outpatient Occupational therapy evaluation, speech and hearing evaluation, ophthalmological services visit |
| Numerator Statement | Patients who were screened for tobacco use at least once within 24 months AND who received tobacco cessation intervention if identified as a tobacco user |

| | 3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention |
|-----------------------|---|
| Numerator Details | <p>Time Period for Data Collection: At least once during the 24 month period</p> <p>Definitions:</p> <p>Tobacco Use – Includes any type of tobacco</p> <p>Tobacco Cessation Intervention – Includes brief counseling (3 minutes or less), and/or pharmacotherapy</p> <p>For EHR:</p> <p>HQMF eMeasure developed and is attached to this submission in fields S.2a and S.2b.</p> <p>NUMERATOR GUIDANCE:</p> <p>If a patient uses any type of tobacco (ie, smokes or uses smokeless tobacco), the expectation is that they should receive tobacco cessation intervention: either counseling and/or pharmacotherapy.</p> <p>If tobacco use status of a patient is unknown, the patient does not meet the screening component required to be counted in the numerator and should be considered a measure failure. Instances where tobacco use status of "unknown" is recorded include: 1) the patient was not screened; or 2) the patient was screened and the patient (or caregiver) was unable to provide a definitive answer. If the patient does not meet the screening component of the numerator but has an allowable medical exception, then the patient should be removed from the denominator of the measure and reported as a valid exception.</p> <p>As noted above in a recommendation statement from the USPSTF, the current evidence is insufficient to recommend electronic nicotine delivery systems (ENDS) including electronic cigarettes for tobacco cessation. Additionally, ENDS are not currently classified as tobacco in the recent evidence review to support the update of the USPSTF recommendation given that the devices do not burn or use tobacco leaves. In light of the current lack of evidence, the measure does not currently capture e-cigarette usage as either tobacco use or a cessation aid.</p> |
| Denominator Statement | All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period |
| Denominator Details | <p>Time Period for Data Collection: 12 consecutive months</p> <p>For EHR:</p> <p>HQMF eMeasure developed and is attached to this submission in fields S.2a and S.2b.</p> |
| Exclusions | Documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason) |
| Exclusion details | <p>Time Period for Data Collection: At least once during the 24 month period</p> <p>Exceptions are used to remove a patient from the denominator of a performance measure when the patient does not receive a therapy or service AND that therapy or service would not be appropriate due to patient-specific reasons. The patient would otherwise meet the denominator criteria. Exceptions are not absolute, and are based on clinical judgment, individual patient characteristics, or patient preferences. The PCPI exception methodology uses three categories of reasons for which a patient may be removed from the denominator of an individual measure. These measure exception categories are not uniformly relevant across all measures; for each measure, there must be a clear rationale to permit an exception for a medical, patient, or system reason. Examples are provided in the measure exception language of instances that may constitute an exception and are intended to serve as a guide to clinicians. For measure Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention, exceptions may include documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason). Where examples of exceptions are included in the measure language, value sets for these examples are developed and included in the eMeasure. Although this methodology does not require the external reporting</p> |

| | |
|-------------------------------|---|
| | <p>3185 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention</p> |
| | <p>of more detailed exception data, the PCPI recommends that physicians document the specific reasons for exception in patients’ medical records for purposes of optimal patient management and audit-readiness. The PCPI also advocates the systematic review and analysis of each physician’s exceptions data to identify practice patterns and opportunities for quality improvement.</p> <p>For EHR: HQMF eMeasure developed and is attached to this submission in fields S.2a and S.2b. DENOMINATOR EXCEPTION GUIDANCE: The medical reason exception only applies to the screening data element of the measure; once a patient has been screened, there are no allowable medical reason exceptions for not providing the intervention. If a patient has a diagnosis of limited life expectancy, that patient has a valid denominator exception for not being screened for tobacco use or for not receiving tobacco use cessation intervention (counseling and/or pharmacotherapy) if identified as a tobacco user.</p> |
| <p>Risk Adjustment</p> | <p>No risk adjustment or risk stratification 113780 140560 113780 140560</p> |
| <p>Stratification</p> | <p>Consistent with CMS’ Measures Management System Blueprint and national recommendations put forth by the IOM and NQF to standardize the collection of race and ethnicity data, we encourage the results of this measure to be stratified by race, ethnicity, administrative sex, and payer and have included these variables as recommended data elements to be collected.</p> |
| <p>Type Score</p> | <p>Rate/proportion better quality = higher score</p> |
| <p>Algorithm</p> | <p>To calculate performance rates:</p> <ol style="list-style-type: none"> 1. Find the patients who meet the initial population (ie, the general group of patients that a set of performance measures is designed to address). 2. From the patients within the initial population criteria, find the patients who qualify for the denominator (ie, the specific group of patients for inclusion in a specific performance measure based on defined criteria). Note: in some cases the initial population and denominator are identical. 3. From the patients within the denominator, find the patients who meet the numerator criteria (ie, the group of patients in the denominator for whom a process or outcome of care occurs). Validate that the number of patients in the numerator is less than or equal to the number of patients in the denominator 4. From the patients who did not meet the numerator criteria, determine if the provider has documented that the patient meets any criteria for exception when denominator exceptions have been specified [for this measure: documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason). If the patient meets any exception criteria, they should be removed from the denominator for performance calculation. --Although the exception cases are removed from the denominator population for the performance calculation, the exception rate (ie, percentage with valid exceptions) should be calculated and reported along with performance rates to track variations in care and highlight possible areas of focus for QI. <p>If the patient does not meet the numerator and a valid exception is not present, this case represents a quality failure. 113780 140560</p> |

| | <p>295.6, 295.60, 295.61, 295.62, 295.63, 295.64, 295.65, 295.7, 295.70, 295.71, 295.72, 295.73, 295.74, 295.75, 295.8, 295.80, 295.81, 295.82, 295.83, 295.84, 295.85, 295.9, 295.90, 295.91, 295.92, 295.93, 295.94, 295.95</p> <p>ICD-10-CM: F20.0, F20.1, F20.2, F20.3, F20.5, F20.81, F20.89, F20.9, F25.0, F25.1, F25.8, F25.9</p> <p>Bipolar disorder</p> <p>ICD-9-CM: 296.00, 296.01, 296.02, 296.03, 296.04, 296.05, 296.06, 296.10, 296.11, 296.12, 296.13, 296.14, 296.15, 296.16, 296.40, 296.41, 296.42, 296.43, 296.44, 296.45, 296.46, 296.50, 296.51, 296.52, 296.53, 296.54, 296.55, 296.56, 296.60, 296.61, 296.62, 296.63, 296.64, 296.65, 296.66, 296.7, 296.80, 296.81, 296.82, 296.89</p> <p>ICD-10-CM: F30.10, F30.11, F30.12, F30.13, F30.2, F30.3, F30.4, F30.8, F30.9, F31.0, F31.10, F31.11, F31.12, F31.13, F31.2, F31.30, F31.31, F31.32, F31.4, F31.5, F31.60, F31.61, F31.62, F31.63, F31.64, F31.70, F31.71, F31.72, F31.73, F31.74, F31.75, F31.76, F31.77, F31.78, F31.81, F31.89, F31.9, F32.8</p> |
| Exclusions | <p>The denominator for this measure excludes discharged patients who:</p> <ol style="list-style-type: none"> 1. Received Electroconvulsive Therapy (ECT) during the inpatient stay or follow-up period. 2. Received Transcranial Magnetic Stimulation (TMS) during the inpatient stay or follow-up period. 3. Were pregnant during the inpatient stay. 4. Had a secondary diagnosis of delirium. 5. Had a principal diagnosis of schizophrenia with a secondary diagnosis of dementia. |
| Exclusion details | <p>1. ECT During Inpatient Stay or Follow-Up Period Rationale: Some patients who receive ECT during the inpatient stay or follow-up period may have failed pharmacotherapy and would not fill an evidence-based prescription post-discharge. Source: Identified from Part A and Part B claims data if treatment occurred on a date between the admission date and 30 days post-discharge.</p> <p>2. TMS During Inpatient Stay or Follow-Up Period Rationale: Some patients who receive TMS during the inpatient stay or follow-up period may have failed pharmacotherapy and would not fill an evidence-based prescription post-discharge. Source: Identified from Part A and Part B claims data if treatment occurred on a date between the admission date and 30 days post-discharge.</p> <p>3. Pregnant During Inpatient Stay Rationale: Some of the evidence-based medications for the treatment of MDD, schizophrenia, and bipolar disorder are contraindicated during pregnancy. Source: Identified from Part A claims data from the index admission.</p> |

| | 3205 Medication Continuation Following Inpatient Psychiatric Discharge |
|-----------------|--|
| | <p>4. Secondary Diagnosis of Delirium Rationale: Some of the evidence-based medications for the treatment of MDD, schizophrenia, and bipolar disorder are contraindicated for patients with delirium. Source: Identified from Part A claims data from the index admission.</p> <p>5. Principal Diagnosis of Schizophrenia with Secondary Diagnosis of Dementia Rationale: APA Practice guidelines suggest caution in the use of antipsychotics in dementia patients so not all dementia patients would fill an evidence-based medication (antipsychotic) following discharge for schizophrenia. Source: Identified from Part A claims data from the index admission.</p> |
| Risk Adjustment | No risk adjustment or risk stratification 126054 126054 |
| Stratification | The measure is not stratified. |
| Type Score | Rate/proportion better quality = higher score |
| Algorithm | <p>Denominator:</p> <ol style="list-style-type: none"> 1. Pull all IPF discharges from the Part A data. 2. Include IPF discharges for patients who were at least 18 years of age at admission. 3. Identify interim claims having the same beneficiary, provider, admission dates or having an admission date within 1 day of the discharge date of the previous claim, and having a discharge status code of "Still patient." Collapse or combine the interim claims into one hospital stay using the admission date from the earliest claim and the discharge date from the latest claim. The data values from the latest claim are used for the newly combined hospital stay. 4. De-duplicate the IPF inpatient discharges dataset by Patient ID, Sex, Provider ID, Admission Date, and Discharge Date. 5. Remove the IPF inpatient discharges for patients who do not have Part A and Part B coverage at admission, during the entire stay, at discharge, and during the 30 days post-discharge. 6. Remove the IPF inpatient discharges that do not have a principal diagnosis of MDD, bipolar disorder, or schizophrenia using value sets containing ICD-9 codes for each of the disease conditions. 7. Remove the IPF inpatient discharges for patients who expired during the hospital stay or within 30 days of discharge. 8. Remove the IPF inpatient discharges for patients who do not have Part D coverage during the 30 days post-discharge. 9. Remove the IPF inpatient discharges for patients who were not discharged to home or home health. 10. Exclude IPF inpatient discharges with a secondary diagnosis of pregnancy or delirium. 11. Exclude IPF inpatient discharges having schizophrenia as the principal diagnosis with a secondary diagnosis of dementia. 12. Exclude IPF inpatient discharges with ECT or TMS during the hospital stay or within 30 days post-discharge. <p>Numerator:</p> <ol style="list-style-type: none"> 1. Pull all Part D claims for the evidence-based medications used for the treatment of MDD, schizophrenia, and bipolar disorder. 2. Pull all Part A and Part B claims for antipsychotic long-acting injectables (LAIs) and add them to the Part D medication claims for schizophrenia and bipolar disorder. |

| Level | Clinician : Group/Practice, Clinician : Individual |
| Setting | Clinician Office/Clinic, Home Health, Other, Behavioral Health : Outpatient Occupational therapy evaluation, speech and hearing evaluation, ophthalmological services visit |
| Numerator Statement | Patients who were screened for tobacco use at least once within 24 months AND who received tobacco cessation intervention if identified as a tobacco user |
| Numerator Details | <p>Time Period for Data Collection: At least once during the 24 month period</p> <p>Definitions:</p> <p>Tobacco Use – Includes any type of tobacco</p> <p>Tobacco Cessation Intervention – Includes brief counseling (3 minutes or less), and/or pharmacotherapy</p> <p>For Administrative Claims/Registry:</p> <p>CPT Category II code 4004F: Patient screened for tobacco use AND received tobacco cessation intervention (counseling, pharmacotherapy, or both), if identified as a tobacco user</p> <p>OR</p> <p>CPT Category II code 1036F: Current tobacco non-user</p> <p>OR</p> <p>CPT Category I code- Smoking and tobacco use cessation counseling</p> <p>*The following codes are applicable if the patient screened positive for smoking/tobacco use and counseling was provided.</p> <p>99406: Smoking/tobacco counseling 3-10 minutes</p> <p>99407: Smoking/tobacco counseling greater than 10 minutes</p> |
| Denominator Statement | All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period |

| | 3225 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention |
|---------------------|--|
| Denominator Details | <p>Time Period for Data Collection: 12 consecutive months</p> <p>For Administrative Claims/Registry: Patient age >= 18 years AND At least two visits during the measurement period (CPT): 90791, 90792, 90832, 90834, 90837, 90845, 92002, 92004, 92012, 92014, 96150, 96151, 96152, 97165, 97166, 97167, 97168, 99201, 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350</p> <p>OR At least one visit during the measurement period (CPT/HCPCS): 92521, 92522, 92523, 92524, 92540, 92557, 96160, 96161, 92625, 99385, 99386, 99387, 99395, 99396, 99397, 99401, 99402, 99403, 99404, 99411, 99412, 99420, 99429, G0438, G0439</p> |
| Exclusions | Documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason) |
| Exclusion details | <p>Exceptions are used to remove a patient from the denominator of a performance measure when the patient does not receive a therapy or service AND that therapy or service would not be appropriate due to patient-specific reasons. The patient would otherwise meet the denominator criteria. Exceptions are not absolute, and are based on clinical judgment, individual patient characteristics, or patient preferences. The PCPI exception methodology uses three categories of reasons for which a patient may be removed from the denominator of an individual measure. These measure exception categories are not uniformly relevant across all measures; for each measure, there must be a clear rationale to permit an exception for a medical, patient, or system reason. Examples are provided in the measure exception language of instances that may constitute an exception and are intended to serve as a guide to clinicians. For measure 0028, exceptions may include medical reasons for not screening for tobacco use (eg, limited life expectancy, other medical reason). Although this methodology does not require the external reporting of more detailed exception data, the PCPI recommends that physicians document the specific reasons for exception in patients' medical records for purposes of optimal patient management and audit-readiness. The PCPI also advocates the systematic review and analysis of each physician's exceptions data to identify practice patterns and opportunities for quality improvement.</p> <p>For Administrative Claims/Registry: CPT Category II code with modifier 4004F-1P: Documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason)</p> |
| Risk Adjustment | <p>No risk adjustment or risk stratification</p> <p>113780 140560 113780 140560</p> |
| Stratification | Consistent with CMS' Measures Management System Blueprint and national recommendations put forth by the IOM and NQF to standardize the collection of race and ethnicity data, PCPI encourages the results of this measure to be stratified by race, ethnicity, administrative sex, and payer and have included these variables as recommended data elements to be collected. |
| Type Score | Rate/proportion better quality = higher score |
| Algorithm | <p>To calculate performance rates:</p> <ol style="list-style-type: none"> 1. Find the patients who meet the initial population (ie, the general group of patients |

| | |
|-------------------------------|---|
| | <p>3225 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention</p> |
| | <p>that a set of performance measures is designed to address).</p> <p>2. From the patients within the initial population criteria, find the patients who qualify for the denominator (ie, the specific group of patients for inclusion in a specific performance measure based on defined criteria). Note: in some cases the initial population and denominator are identical.</p> <p>3. From the patients within the denominator, find the patients who meet the numerator criteria (ie, the group of patients in the denominator for whom a process or outcome of care occurs). Validate that the number of patients in the numerator is less than or equal to the number of patients in the denominator</p> <p>4. From the patients who did not meet the numerator criteria, determine if the provider has documented that the patient meets any criteria for exception when denominator exceptions have been specified [for this measure: documentation of medical reason(s) for not screening for tobacco use (eg, limited life expectancy, other medical reason). If the patient meets any exception criteria, they should be removed from the denominator for performance calculation. --Although the exception cases are removed from the denominator population for the performance calculation, the exception rate (ie, percentage with valid exceptions) should be calculated and reported along with performance rates to track variations in care and highlight possible areas of focus for QI.</p> <p>If the patient does not meet the numerator and a valid exception is not present, this case represents a quality failure. 113780 140560</p> |

|--|-------------------------------|---|
| 0008: Experience of Care and Health Outcomes (ECHO) Survey | Submitted by D.E.B. Potter | <p>I am speaking to you today as an individual, not as a representative of HHS or ASPE. Since 2011, I have also been an Ex-Officio Member of the Measure Applications Partnership (MAP) Duals Eligible Beneficiary Workgroup. I would like to talk today about the first measure on the Agenda for tomorrow’s Behavioral Health (BH) Standing Committee meeting.</p> <p>The CAHPS® behavioral health experience with care measure – ECHO—(NQF 0008) is (like several other CAHPS® measures) included in the MAP Dual Eligible Beneficiary Family of Measures. In 2015 the MAP Duals Workgroup undertook a measure alignment exercise to identify the users of measures in the Duals Family of measures. Based upon the 6/25/15 version of the MAP tool (no longer on MAP site) several of the states involved in the Medicare/Medicaid Financial Alignment Demonstration use the ECHO to assess performance. NQF obtained data on ECHO’s use by abstracting information from the Memorandums of Understanding signed between CMS and the states. In 2015 the following states were using the ECHO.</p> <ul style="list-style-type: none"> • California Capitated State Demo • Illinois Capitated State Demo • Massachusetts Capitated State Demo • Michigan Capitated State Demo • New York Capitated State Demo • Ohio Capitated State Demo • South Carolina Capitated State Demo • Texas Capitated State Demo • Virginia Capitated State Demo <p>As of 2017 all of these Demos were on-going (although VA’s will end this year).</p> <p>Zainulbhai et al, (Commonwealth Issue Brief, March 2014, pub 1734, Vol 2) further identified the ECHO (and the CAHPS® Plan measure) as CMS Core Measures for the Demonstration (capitated plans).</p> <p>In the Worksheet provided on the ECHO (NQF 0008) for this</p> |

| Topic | Commenter | Comment |
|-------|-----------|---|
| | | <p>meeting it is noted that “no recent data on performance results were provided for the 17 PRO-PMs included.” Based upon ECHO’s required use in CMS funded programs (that involved multiple health plans) I suggest that perhaps some recent data (for multiple years) do exist for the ECHO items, just not easily seen/obtainable by the public and/or the research community. Given the importance of having NQF endorsed PRO measures for the BH population, I (as an individual, not a representative of HHS or ASPE) urge the BH Standing Committee members, the ECHO Measure Steward and/or the NQF BH staff reach out (if not already done so) to CMS MMCO, these States and their health plans to determine if more recent PRO item data does exist and to request that data be submitted for Committee evaluation. NQF could begin that conversation with Alice Lind (member, and former Co- Chair, of the MAPS Dual Workgroup).</p> |
