This form contains the measure information submitted by stewards. Blank fields indicate no information was provided. Attachments also may have been submitted and are provided to reviewers. The subcriteria and most of the footnotes from the evaluation criteria are provided in Word comments within the form and will appear if your cursor is over the highlighted area. Hyperlinks to the evaluation criteria and ratings are provided in each section.

TAP/Workgroup (if utilized): Complete all yellow highlighted areas of the form. Evaluate the extent to which each subcriterion is met. Based on your evaluation, summarize the strengths and weaknesses in each section.

Note: If there is no TAP or workgroup, the SC also evaluates the subcriteria (yellow highlighted areas).

Steering Committee: Complete all pink highlighted areas of the form. Review the workgroup/TAP assessment of the subcriteria, noting any areas of disagreement; then evaluate the extent to which each major criterion is met; and finally, indicate your recommendation for the endorsement. Provide the rationale for your ratings.

Evaluation ratings of the extent to which the criteria are met
C = Completely (unquestionably demonstrated to meet the criterion)
P = Partially (demonstrated to partially meet the criterion)
M = Minimally (addressed BUT demonstrated to only minimally meet the criterion)
N = Not at all (NOT addressed; OR incorrectly addressed; OR demonstrated to NOT meet the criterion)
NA = Not applicable (only an option for a few subcriteria as indicated)

(for NQF staff use)

NQF Review #: 1496
NQF Project: Cardiovascular Endorsement Maintenance 2010

---

**MEASURE DESCRIPTIVE INFORMATION**

**De.1 Measure Title:** Cardiac Rehabilitation/Secondary Prevention (CR) Program Structure-Based Measurement Set to Set Safety Standards for CR Programming

**De.2 Brief description of measure:** Cardiac Rehabilitation/Secondary Prevention (CR) Program Measurement Set to assess the presence of 4 safety standards

**1.1-2 Type of Measure:** Structure/management

**De.3 If included in a composite or paired with another measure, please identify composite or paired measure**
This is one of a group of paired measures to promote and measure quality in cardiac rehabilitation/secondary prevention programs (CR) and is associated with two NQF endorsed measures related to referral to CR. During development of the referral measures and during that endorsement process, reviewers emphasized that it is important to assure quality CR programming and to encourage care coordination with other health care providers. Moreover, this set of measures both quantifies the infrastructure from which CR is provided and delineates specific aspects of care to incorporate into relevant dimensions. This measure and its paired measures are being submitted to fill those roles.

**De.4 National Priority Partners Priority Area:** Care coordination

**De.5 IOM Quality Domain:** Patient-centered

**De.6 Consumer Care Need:** Getting better, Staying healthy, Living with illness

---

**CONDITIONS FOR CONSIDERATION BY NQF**

Four conditions must be met before proposed measures may be considered and evaluated for suitability as voluntary consensus standards:

**NQF Staff**

A. The measure is in the public domain or an intellectual property (measure steward agreement) is signed. *Public domain only applies to governmental organizations. All non-governmental organizations must sign a measure steward agreement even if measures are made publicly and freely available.*

A.1 Do you attest that the measure steward holds intellectual property rights to the measure and the
### 1. IMPORTANCE TO MEASURE AND REPORT

<table>
<thead>
<tr>
<th>Extent to which the specific measure focus is important to making significant gains in health care quality (safety, timeliness, effectiveness, efficiency, equity, patient-centeredness) and improving health outcomes for a specific high impact aspect of healthcare where there is variation in or overall poor performance. Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1a. High Impact</td>
</tr>
</tbody>
</table>

#### (for NQF staff use) Specific NPP goal:

1a.1 Demonstrated High Impact Aspect of Healthcare: Patient/societal consequences of poor quality

1a.2

1a.3 Summary of Evidence of High Impact: The National Quality Forum recently endorsed performance measures to assess referral to cardiac rehabilitation/secondary prevention programs (CR) from inpatient and outpatient settings (0642 and 0643). These measures were developed to correct disparities in underutilization of CR, because CR has been shown to decrease morbidity and mortality following acute cardiac events, as well as improve functional capacity, cardiovascular risk factors, adherence with preventive medications, and psychosocial well-being. Moreover, CR programs promote care coordination, by facilitating communication about secondary prevention issues between patients and their healthcare providers. It is vital that CR programs are provided in a safe environment, assess individual patient risk for adverse events, and monitor patients’ response to therapy and program effectiveness, in order to provide appropriate individualized patient care and to promote continuous quality improvement.

Cardiac rehabilitation/secondary prevention (CR) services reduce morbidity and mortality in patients with

---

Comment [KP1]: 1a. The measure focus addresses:
- a specific national health goal/priority identified by NQF’s National Priorities Partners; OR
- a demonstrated high impact aspect of healthcare (e.g., affects large numbers, leading cause of morbidity/mortality, high resource use (current and/or future), severity of illness, and patient/societal consequences of poor quality).
cardiovascular disease. (1,2,3) These patients are at relatively high risk for cardiovascular emergencies and recurrent cardiovascular events, which is why safety precautions are very important for CR service delivery. There is a growing trend among patients referred to and completing early outpatient CR to be older, at higher risk, and have more chronic comorbidities (4). Medical supervision is the most important day-to-day safety factor in CR (5). Personnel and equipment for ACLS are essential to the adequate delivery of emergency care for patients who experience cardiac arrest or other life-threatening events during CR sessions. The delivery of CR services is physician-directed and provided by a multidisciplinary staff of health care professionals. A system for communication between a physician-director with expertise in cardiovascular disease (CVD) management and a referring or primary physician enhances the program’s success in helping that patients achieve individualized target goals. It is the responsibility of the physician-director to assure that the information and instruction given to patients in CR is consistent with the most current clinical practice guidelines. Although rare, cardiovascular emergencies can occur during exercise training in CR programs. Studies suggest that the incidence of cardiac arrest requiring defibrillation is approximately 1 arrest every 100,000 patient-hours (6). Practice guidelines for management of cardiac arrest include the use of BLS and ACLS strategies, such as early defibrillation (5,7). Such strategies have been shown to help improve outcomes in persons who experience cardiac arrest (8).

1b. Opportunity for Improvement

1b.1 Benefits (improvements in quality) envisioned by use of this measure: This measure delineates criteria related to medical direction and emergency preparedness for CR. This is intended to assure that cardiac rehabilitation/secondary prevention programs have processes in place to identify high risk patients, monitor and treat them appropriately, and communicate with physicians and other health care providers to improve clinical outcomes. It is part of a set of measures related to CR, and those measures are designed to assure high quality coordinated secondary prevention programs for patients with cardiovascular disease.

1b.2 Summary of data demonstrating performance gap (variation or overall poor performance) across providers: The American Association of Cardiovascular and Pulmonary Rehabilitation (AACVPR) sponsors a Certification and Recertification process to help Cardiac Rehabilitation/Secondary Prevention Programs (CR) engage in quality improvement. (1) This process is linked to the American Heart Association/AACVPR Core Components.
of CR scientific statement (2), as well as to AACVPR CR Program Guidelines (3).

Requirements for program certification currently include submission of staff competency records, lists of emergency equipment and supplies, Policy and Procedure Manual table of contents, written policies addressing medical emergency care, evidence of verification of operational readiness for emergency care, and documentation of emergency inservices. These elements reflect a program’s compliance with the safety standards required in this performance measure. However, less than 40% of CR programs operating in the United States are currently AACVPR certified, demonstrating significant opportunity for improvement with implementation of this measure. (4)

Recent data from the AACVPR Certification/Recertification process also confirms variability in performance across providers, even among those CR professionals who are motivated to apply for voluntary certification for performance improvement reasons. From a total of 607 applications received in 2007-2009, 467 required remediation efforts and resubmission prior to approval, 39 were not approved and were placed into a provisional category, and 12 were denied certification or recertification. In 2010, out of 105 applications for certification, four were denied, and from 247 applications for re-certification, 2 were denied. (4)

1b.3 Citations for data on performance gap:
4. Personal communication from Abagail Lynn, AACVPR staff

1b.4 Summary of Data on disparities by population group:
There is no published evidence demonstrating that there are disparities in care among populations who are enrolled in CR programs related to this measure focus. In fact, during a recent national AACVPR survey of CR Program Directors (n=173), who treat patients in a variety of settings ranging from rural to suburban to urban, 98.8% included the medical and emergency standards in this measure in their operations policies and procedures. This is consistent with the low rate of recertification denial (<1%) in 2010.

1b.5 Citations for data on Disparities:
http://www.surveymonkey.com/sr.aspx?sm=551wJfUe5_2f8auJvT5mypJGlp1YqAKyp09ARIj_2bWXQ_3d

1c. Outcome or Evidence to Support Measure Focus

1c.1 Relationship to Outcomes (For non-outcome measures, briefly describe the relationship to desired outcome. For outcomes, describe why it is relevant to the target population): While not an outcome, this measure is designed to help health care groups identify potentially correctable and actionable “upstream” sources of suboptimal care. This measure quantifies the infrastructure from which CR is provided and is based on the provision of appropriate personnel and equipment to satisfy high-quality standards of care for CR services. Cardiac rehabilitation/secondary prevention (CR) services reduce morbidity and mortality in patients with cardiovascular disease. These patients are at relatively high risk for cardiovascular emergencies and recurrent cardiovascular events, which is why safety precautions are very important for CR service delivery.

1c.2-3. Type of Evidence: Other Scientific Statements

1c.4 Summary of Evidence (as described in the criteria; for outcomes, summarize any evidence that healthcare services/care processes influence the outcome):
The position papers and guidelines from the AACVPR and the American Heart Association listed below were written to help CR professionals provide high quality CR programs, and these documents clearly support this performance measure. The provisions of this measure support safe, effective CR programming. There is a consistent body of strong evidence to show that CR decreases mortality and improves modifiable CVD risk factors, adherence to preventive medications, and quality of life, and this measure was developed to assure safety measures for CR programs.

Relevant statements from AHA and AACVPR scientific statements and guidelines:
See the above recommendations from AHA/AACVPR Scientific Statements and AACVPR guidelines. (1) Medical Director Responsibilities for Outpatient Cardiac Rehabilitation/Secondary Prevention Programs: A Scientific Statement from the American Heart Association/American Association for Cardiovascular and Pulmonary Rehabilitation

There is a physician-director responsible for program oversight and to ensure that policies and procedures are consistent with evidence-based guidelines, safety standards, and regulatory standards.

(2) AACVPR Guidelines for Cardiac Rehabilitation and Secondary Prevention Programs: All professional staff have completed BLS training: at least 1 staff member is present who has successfully completed ACLS training in AHA curriculum for ACLS and has met state and hospital or facility medico-legal requirements for defibrillation and other related practices.

(3) Exercise Standards for Testing and Training: A Statement for Health Professionals From the American Heart Association. AHA Scientific Statement: An emergency response team is immediately available to respond to medical emergencies.

1c.5 Rating of strength/quality of evidence (also provide narrative description of the rating and by whom):

N/A

1c.6 Method for rating evidence: Scientific Statements

1c.7 Summary of Controversy/Contradictory Evidence: There is some controversy about this measure, especially for the conditions listed in the second and fourth bullets under this measure, due to the fact that the rate of emergencies during CR sessions is low. However, please note that one of the paired measures for CR programming is related to assessing risk for adverse cardiovascular events. As non-traditional cardiac rehabilitation programming is developed in order to improve access to currently underserved populations, it is anticipated that CR programs, in conjunction with their Medical Director, will develop policies and protocols to assure safety for low-risk patients during exercise in non-traditional settings. The conditions required in #2 and #4 (emergency response team, functional emergency resuscitation equipment) may not be appropriate for non-traditional exercise settings such as community or home based exercise programs that are supplemented by nurse-led secondary prevention education. Measure development and publication followed standard ACC/AHA performance measure methodology. After this measure was developed, a survey of CR experts revealed that some were concerned about unintended consequences of this measure on non-traditional programming in future. However, this measure does recognize that non-traditional programming is needed for under-served populations and encourages CR Medical Directors to develop policies and procedures for alternative programming, such as home-based CR.

1c.9 Quote the Specific guideline recommendation (including guideline number and/or page number):
See the above recommendations from AHA/AACVPR Scientific Statements and AACVPR guidelines

1c.10 Clinical Practice Guideline Citation: See above

1c.11 National Guideline Clearinghouse or other URL: N/A

1c.12 Rating of strength of recommendation (also provide narrative description of the rating and by whom):

N/A
### 1c.13 Method for rating strength of recommendation (if different from USPSTF system, also describe rating and how it relates to USPSTF):

N/A

### 1c.14 Rationale for using this guideline over others:

This guideline was the major source document for development of this performance measure because it provides guidance about target goals for the majority of the modifiable cardiovascular risk factors. The core components of cardiac rehabilitation are based on this guideline.

### TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Importance to Measure and Report?

### Steering Committee: Was the threshold criterion, Importance to Measure and Report, met?

#### Rationale:

Y

### 2. SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)

Clinicians: Group, Facility/Agency, Integrated delivery system, Other  Interdisciplinary teams of cardiac rehabilitation/secondary prevention professionals providing CR services

2a.36-37 Care Settings (Check the setting(s) for which the measure is specified and tested)
Ambulatory Care: Office, Ambulatory Care: Clinic, Ambulatory Care: Hospital Outpatient, Rehabilitation Facility, Other Community Healthcare

2a.38-41 Clinical Services (Healthcare services being measured, check all that apply)
Clinicians: Dietician/Nutritional professional, Clinicians: Nurses, Clinicians: PA/NP/Advanced Practice Nurse, Clinicians: Physicians (MD/DO), Clinicians: Psychologist/LCSW, Clinicians: PT/OT/Speech, Other exercise specialists

2b. Reliability testing

2b.1 Data/sample (description of data/sample and size): Because the AACVPR cardiac rehabilitation program certification and recertification process requires documentation that programs are compliant with this measure, inter-rater reliability testing was performed for a subset of records submitted for program certification in 2010. AACVPR certification is a process that helps programs improve care and meet essential standards via application of performance measures and guidelines. Currently, there are 1,147 AACVPR certified programs in the United States. In 2009, specific steps were taken to improve Inter-Rater Reliability related to the certification and recertification process. These steps were as follows: 1) Pre-examination training for all examiners completed by interactive webinar, 2) Limit response of examiners to pre-approved text unless approved by committee chair, 3) Applications not meeting full certification requirements must be presented to and approved by the Chair prior to determination being finalized, 4) Examiners will use the period between first and second review of applications (April to July) to remediate with applicants who have outstanding issues, 5) Chairs will be issued fewer applications for review to enable them to support the examiners in their remediation efforts, 6) the Appeals Task Force will be required to complete the interactive webinar-based examiner training prior to reviewing and scoring appeals, 7) Chairs will meet after the examination process to abstract and review a limited sampling from each examiner to ensure consistency in scoring and standards interpretation, 8) identified inter-examiner variances will be addressed on an individual basis by the respective chair (Certification or Recertification) who will provide direct one on one or group (if indicated) training regarding the observed variances, and said variance will be highlighted in the next annual training program, and 9) considerable time and expense have and will continue to be applied to the annual review of application questions to refine the validity and clarity of each component of the application. Subsequently, during 2010, a subset of 30 program applications was tested for inter-rater reliability.

2b.2 Analytic Method (type of reliability & rationale, method for testing):
Inter-Rater Reliability: Inter-rater reliability testing was performed by 6 experienced AACVPR certification reviewers on a total of 30 records submitted for program certification in 2010. Each reviewer re-reviewed each application to determine acceptance or denial of certification, blinded to the original decision and name of the facility. In addition, no reviewer was given a program he/she had initially reviewed. Certification is an all or none phenomenon - there must be evidence for compliance with all measures in order for a program to be certified. Therefore, agreement about whether to certify or deny also confirms agreement about compliance with this particular measure related to program safety. Cohen’s Unweighted Kappa testing was used to determine degree of inter-rater agreement.

2b.3 Testing Results (reliability statistics, assessment of adequacy in the context of norms for the test conducted):
INTER-RATER RELIABILITY: 24 of the applications that were initially approved for certification were also approved on second review (approved/approved). 4 of the applications that were initially denied certification were also denied on second review (denied/denied). 2 of the applications that were initially
approved for certification were scored as denied second review (approved/denied). There were no applications that were initially denied that were then scored as approved on second review (denied/approved). Analysis for Cohen’s Unweighted Kappa was performed and revealed a coefficient of 0.7619. According to the scale for agreement established by Landis and Koch in 1977 (0.41 – 0.60 “moderate agreement”; 0.61 – 0.80 “substantial agreement”; and 0.81 – 1.00 “almost perfect agreement”) a kappa coefficient of 0.7619 places the inter-rater reliability of the measure set firmly in the high end of “substantial agreement”.

<table>
<thead>
<tr>
<th>NQF #1496</th>
</tr>
</thead>
</table>

2c. Validity testing

2c.1 Data/sample (description of data/sample and size): CONTENT/CONTEXT VALIDITY: To determine the content/context validity of the measures, a Delphi like peer review process was utilized. An explicit part of all ACCF/AHA performance measures development is conducting a formal 30 day public comment period. Reviewers were asked to provide comments on the document on the basis of the rating form and guide shown on page 1432 at http://content.onlinejacc.org/cgi/reprint/j.jacc.2007.04.033v1.pdf

Content/context validity of the measures were established by virtue of the specialized expertise of the Performance Measures Work Group members who were involved in identifying and drafting the performance measures (all leaders and experts in the field of cardiac rehabilitation as chosen by the American Association of Cardiovascular and Pulmonary Rehabilitation (AACVPR), the American College of Cardiology (ACC), and the American Heart Association (AHA), as well as the structured discussions that the work group conducted, in addition to rigorous peer review and public comment.

FACE VALIDITY: In addition to determination by the sample experts listed for content and context validity, face validity was also determined through rigorous peer review. A panel of 15 experts in the field of cardiac rehabilitation were contacted through an online survey tool and were asked to rate each measure according to the following statement: “In my expert opinion, the details of the measure xx describe high quality safety standards for a cardiac rehabilitation program.” Reviewers were aware that they were rating the performance measure set, but were blinded to information that these results were to be made available to NQF as part of the performance measure submission process. A four-point forced choice Likert scale was utilized to eliminate the possibility of a reviewer scoring “not applicable” as it was believed that experts at this level should have an opinion as to the standards applicable to each measure (4 strongly agree; 3 agree; 2 disagree; 1 strongly disagree).

Face validity testing was done in 2010, using a standardized survey available at http://www.surveymonkey.com/sr.aspx?sm=p35w25AivjYawuENNS_2flBUs57c5T_2fBgpio619Ywq57NIE_3d. The Wisconsin Cardiac Rehabilitation Outcomes Registry (WiCORE) is an online database designed to collect individual patient-level data collected at cardiac rehabilitation admission and discharge from diverse programs from around the country (not limited to the state of Wisconsin). It is the most extensive, non-commercial, patient-level database of cardiac rehabilitation outcomes available in the United States. WiCORE is the product of collaboration between WISCPHR (The Wisconsin Society for Cardiovascular and Pulmonary Health and Rehabilitation), HDSP (The State of Wisconsin Heart Disease and Stroke Prevention Program), and DoIT (The University of Wisconsin Department of Information Technology, Office of Collaborative Applications). WiCORE currently has data on over 17,000 patients, with discharge data available for over 12,000 of these records.

2c.2 Analytic Method (type of validity & rationale, method for testing): CONTENT/CONTEXT VALIDITY: Determined by structured work group discussions, in addition to rigorous peer review and public comment. The steps in the analytic method were: 1. Formation of the Development Committee: This measure was developed by the AACVPR/ACC/AHA Cardiac Rehabilitation/Secondary Prevention Performance Measures Writing Committee, which was initially convened in 2005. The Writing Committee was composed of appointed representatives from the American Association of Cardiovascular and Pulmonary Rehabilitation (AACVPR), the American College of Cardiology (ACC), and the American Heart Association (AHA), including past and current presidents of AACVPR, and clinicians with expertise in general clinical cardiology, heart failure, cardiovascular disease, and cardiac rehabilitation. 2. Identification of Potential Factors for Inclusion: The Writing Committee initially identified 39 factors from various practice guidelines and other reports that were considered potential performance measures for the Cardiac Rehabilitation/Secondary Prevention Performance Measurement Sets based on level of evidence and strength of recommendation from the peer reviewed literature. These 39 measures were then evaluated for inclusion in the initial draft of the measures according to guidelines established by the ACC/AHA Task Force on Performance Measures. Those measures that were deemed to be most evidence-based, interpretable,
actionable, clinically meaningful, valid, reliable, and feasible were included in the final performance measurement sets. Once these measures were identified, the Writing Committee then discussed and refined, over a series of months, the definition, content, and other details of each of the selected measures. 3. Scoring of the Factors/Expert Opinion: Utilizing the ACC/AHA system for classification of recommendations and level of evidence for guidelines and clinical recommendations system those measures that were deemed to be most evidence-based, interpretable, actionable, clinically meaningful, valid, reliable, and feasible were included in the final performance measurement sets. 4. Number of Factors Kept: 20 factors were included in the final draft of the performance measures. 5. Refinement of the PM by the Development Committee: After the measures were identified, the Writing Committee discussed and refined these measures, developing the definition, content, and other details during 2006. 6. Public Comment Period/Peer Review: The measurement set underwent a public comment period from December 11, 2006 until January 11, 2007. Peer reviewers were asked to provide comments on the document on the basis of a Likert like rating form assessing the evidence-base for each measure, the interpretability for practitioners of each measure, if the measure were actionable for practitioners, and design elements of each measure including the denominator and numerator. 7. Further Refinement: After the public comment period the measures were identified, the Writing Committee discussed and refined these measures, developing the definition, content, and other details during 2007. The final measure set was approved by the American Association of Cardiovascular and Pulmonary Rehabilitation Board of Directors in May, 2007, the American College of Cardiology Foundation Board of Trustees in April 2007, and by the American Heart Association Science Advisory and Coordinating Committee in April 2007. The performance measure set was also reviewed via AHA and ACC processes as well as by the AACVPR Program Oversight Committee. 8. Peer Review Publication/Endorsement: The final document was submitted to the Journal of the American College of Cardiology (the official journal of the American College of Cardiology), the Journal of Cardiopulmonary Rehabilitation and Prevention (the official journal of the American Association of Cardiovascular and Pulmonary Rehabilitation) and Circulation (the official journal of the American Heart Association) for peer review and publication.

FACE VALIDITY: The face validity of the measure set was determined via a four step process. 1. Standards of Care: Determined through the process listed for content and context validity. It was determined by this process that this measure has a high face validity, because the standards in this measure are well established as standards of care, including individualized patient assessment for cardiovascular risk and communication with other health care providers about adverse events. 2. Public Comment Period: Face validity assessment is available for this measure, based on data from the public comment period of the AACVPR/ACCF/AHA performance measures that were published in 2007. 3. Testing Via Certification/ Recertification Process: Currently, compliance with this measure is determined through the AACVPR Program Certification/ Re-certification. AACVPR has developed a national Outcomes Data Registry which allows correlation of compliance with this measure to meaningful clinical outcomes. 4. Peer Review: Face validity was also determined through rigorous peer review. A panel of 15 experts in the field of cardiac rehabilitation were contacted through an online survey tool and were asked to rate each measure according to the following statement: “In my expert opinion, the details of the measure xx describe high quality safety standards for a cardiac rehabilitation program.” Reviewers were aware that they were rating the performance measure set, but were blinded to information that these results were to be made available to NQF as part of the performance measure submission process. A four-point forced choice Likert scale was utilized to eliminate the possibility of a reviewer scoring “not applicable” as it was believed that experts at this level should have an opinion as to the standards applicable to each measure (4 strongly agree; 3 agree; 2 disagree; 1 strongly disagree). PREDICTIVE VALIDITY: An analysis has been conducted to examine programmatic structures, utilization and outcomes of the WiCORE dataset. To test the predictive ability of the measure set, outcomes for patients enrolled in cardiac rehabilitation programs that were AACVPR-certified (approximately 40% of the programs currently enrolled in WiCore) have been compared to outcomes for patient enrolled in programs that were not AACVPR certified in the WiCORE dataset. The analysis tests the hypothesis that AACVPR-certified programs had superior outcomes compared to those that were not certified. Outcomes included in the analysis will be: changes in lifestyle habits (exercise, nutrition, smoking); treatment with and adherence to preventive medications; functional capacity; quality of life; psychological health; re-hospitalization rates; recurrent CVD events and mortality. All data would be adjusted for potential confounders (age, comorbid conditions and program characteristics.).

2c.3 Testing Results (statistical results, assessment of adequacy in the context of norms for the test)
the details of the measure describe high quality safety standards for a cardiac rehabilitation program.

survey tool and asked to rate each measure according to the following statement: “In my expert opinion, FACE VALIDITY: A panel of 15 experts in the field of cardiac rehabilitation was contacted through an online http://content.onlinejacc.org/cgi/reprint/j.jacc.2007.04.033v1.pdf.

CONTENT/CONTEXT VALIDITY: In May 2007 the final peer reviewed publication of the performance measures in February 2011.

Additional testing will be made available by the time the NQF Cardiovascular Steering Committee convenes in February 2011.

2d.4 Analytic Method (type analysis & rationale):
N/A

2d.5 Testing Results (e.g., frequency, variability, sensitivity analyses):
N/A

2e. Risk Adjustment for Outcomes/ Resource Use Measures

2e.1 Data/sample (description of data/sample and size): N/A

2e.2 Analytic Method (type risk adjustment, analysis, & rationale):
N/A

2e.3 Testing Results (risk model performance metrics):
N/A

2e.4 If outcome or resource use measure is not risk adjusted, provide rationale: N/A

2f. Identification of Meaningful Differences in Performance

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable
In the year 2007, 247 cardiac rehabilitation programs applied for AACVPR certification or recertification. In 2009, 168 programs applied for certification. These 353 programs form the data set for the analysis.

2f.3 Methods to identify statistically significant and practically/meaningfully differences in performance

Please refer to section 2b for details about training and inter-rater reliability testing of AACVPR program certification reviewers. Elements of this performance measure are currently used as required standards for program certification. Reviewers determine compliance with this measure by evaluating materials submitted for the questions on pages 2, 3, 4, 8, and 9 of the Certification application. Programs must submit evidence for compliance with all application questions in order to be recommended for certification or recertification. The final decision for certification, recertification or denial is made by the AACVPR Board of Directors and specific information about the reason for denial is provided to the Board by the review committee. The reasons for denial during 2007 and 2009 are included in 2f.3.

In 2007, 62 programs cardiac rehabilitation programs applied for AACVPR certification and in 2009 168 applied. Of these, 163 were approved (97%) and 5 were denied (3%). Programs that apply for certification represent a skewed sample of all cardiac rehabilitation programs in the country as they clearly have already been endorsed by NQF (0642 and 0643). See section 3b1 for details.

In 2009, the program that was denied certification in 2007 was accepted. This demonstrates that the self-study initiated by the certification review process can be successful in remediation of programs to follow the performance measures proposed.

Additionally, in 2007, 185 programs applied for re-certification and 184 were approved (99.5%) thus demonstrating the consistency of the measures. Finally, the one program denied re-certification in 2007, was approved in 2009 after remediation.

2g. Comparability of Multiple Data Sources/Methods

2g.1 Data/sample (description of data/sample and size): We are not currently aware of any other data sources beyond what has been specified for the proposed 4 measures and the referral measures that have already been endorsed by NQF (0642 and 0643). See section 3b1 for details.

2g.2 Analytic Method (type of analysis & rationale):
N/A

2g.3 Testing Results (e.g., correlation statistics, comparison of rankings):
N/A

2h. Disparities in Care

2h.1 If measure is stratified, provide stratified results (scores by stratified categories/cohorts): N/A

2h.2 If disparities have been reported/identified, but measure is not specified to detect disparities, provide follow-up plans:

TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Scientific Acceptability of Measure Properties?

Steering Committee: Overall, to what extent was the criterion, Scientific Acceptability of Measure Properties, met?

Rationale:
### 3a. Meaningful, Understandable, and Useful Information

**3a.1 Current Use:** In use

**3a.2 Use in a public reporting initiative (disclosure of performance results to the public at large) (if used in a public reporting initiative, provide name of initiative(s), locations, Web page URL(s). If not publicly reported, state the plans to achieve public reporting within 3 years):**

This measure is incorporated into the AACVPR Certification and Recertification program and certified CR programs are identified in the AACVPR Program Directory, which is publicly available on several websites, including those listed below:

- AACVPR Certified Program Directory - Searchable Program Directory for patients and healthcare practitioners:

- AHA cardiac rehabilitation education web site:
  - [http://www.heart.org/HEARTORG/Conditions/More/CardiacRehab/What-is-Cardiac-Rehabilitation_UCM_307049_Article.jsp](http://www.heart.org/HEARTORG/Conditions/More/CardiacRehab/What-is-Cardiac-Rehabilitation_UCM_307049_Article.jsp)

- Society for Cardiovascular Angiography and Interventions (SCAI) Seconds-Count cardiac rehabilitation education webpage:
  - [http://www.scai.org/SecondsCount/Treatment/cardiacrehab.aspx](http://www.scai.org/SecondsCount/Treatment/cardiacrehab.aspx)

**3a.3 If used in other programs/initiatives (if used in quality improvement or other programs/initiatives, name of initiative(s), locations, Web page URL(s). If not used for QI, state the plans to achieve use for QI within 3 years):**

Although this measure is not currently publicly reported, its components are included in the AACVPR Certification and Recertification application. Currently, there are a total of 1,146 AACVPR certified cardiac rehabilitation/secondary prevention programs in the United States, which is less than 40% of eligible programs. A link to AACVPR Certified programs is found at:

Attainment of AACVPR certification is a quality improvement initiative for an individual CR program. During the certification and recertification process, programs are required to provide evidence that they meet safety standards related to physician direction, emergency preparedness, patient assessment and communication with physicians, as well as other quality measures related to individualization of programming and use of outcomes data to do local quality improvement projects.

CR performance measures are also used for regional quality improvement initiatives. For example, the Montana Outcomes project has used information from CR reporting of modifiable risk factors such as functional capacity, dietary fat consumption, and BP pressure measurement to develop three multi-state outcomes projects. Data reported from CR programs showed variation in functional capacity outcomes. Research into why some programs were under-performers revealed conservative exercise prescription and failure to encourage exercise on days that patients were not attending CR sessions. After intervention, which consisted of a webinar about appropriate exercise prescription and home walking programs, aggregate data revealed an increase in functional capacity from 28% improvement after CR to 39% improvement, compared to baseline. The Montana Outcomes project also helped underperforming CR programs improve outcomes related to dietary fat intake. The intervention program consisted of a webinar by a registered dietitian to CR staff, including access to patient education slides and handouts. After intervention, aggregate outcomes data related to reported dietary fat intake improved from 24% improvement in fat intake prior to intervention to 29% improvement. Finally, this registry was used to identify disparities related to blood pressure measurement in CR and to correct these disparities.

Interventions included institution of JNC guidelines, patient education related to sodium, weight loss, medication compliance, physician communication, and encouraging exercise. Prior to the intervention (April to June, 2009), 81% met goal criteria for blood pressure control. Post intervention (July to September, 2009), 97% met goal criteria for BP control.
### Testing of Interpretability

**Testing that demonstrates the results are understood by the potential users for public reporting and quality improvement**

#### 3a.4 Data/sample (description of data/sample and size): characteristics of the entities included

No specific testing is needed, as there is already evidence that this measure is understood by providers and health policy makers. In fact, during a recent national AACVPR survey of CR Program Directors (n=173), who treat patients in a variety of settings ranging from rural to suburban to urban, 98.8% included medical and emergency standards in their operations policies and procedures. In addition, elements of the measure are included in the National Coverage Determination Policy issued by the Centers for Medicare and Medicaid Services for Cardiac Rehabilitation in 2006 and in the AACVPR Certification/Recertification process, which is used by many CR professionals. Lastly, both the AHA and SCAI patient education websites includes a link to the AACVPR Certified Program Directory.

#### 3a.5 Methods (e.g., focus group, survey, QI project):

- [http://www.heart.org/HEARTORG/Conditions/More/CardiacRehab/What-is-Cardiac-Rehabilitation_UCM_307049_Article.jsp](http://www.heart.org/HEARTORG/Conditions/More/CardiacRehab/What-is-Cardiac-Rehabilitation_UCM_307049_Article.jsp)
- [http://www.scai.org/SecondsCount/Treatment/cardiacrehab.aspx](http://www.scai.org/SecondsCount/Treatment/cardiacrehab.aspx)

#### 3a.6 Results (qualitative and/or quantitative results and conclusions):

See above.

#### 3b/3c. Relation to other NQF-endorsed measures

**3b.1 NQF # and Title of similar or related measures:**

- 0642: Cardiac Rehabilitation Referral from inpatient setting
- 0643: Cardiac Rehabilitation Referral from outpatient setting

**Notes on similar/related endorsed or submitted measures:**

**3b. Harmonization**

If this measure is related to measure(s) already **endorsed by NQF** (e.g., same topic, but different target population/setting/data source or different topic but same target population):

Yes, fully harmonized. This measure is harmonized with the recently NQF endorsed referral to cardiac rehabilitation/secondary prevention programs from inpatient and outpatient setting measures. It was developed to assure minimum safety standards for these programs.

**3c. Distinctive or Additive Value**

If this measure is similar to measure(s) already **endorsed by NQF** (i.e., on the same topic and the same target population), **Describe why it is a more valid or efficient way to measure quality:**

This measure, and other submitted paired measures, provide performance measures to encourage continuous quality improvement within multidisciplinary, team based cardiac rehabilitation/secondary prevention programs. This measure should be paired with 2 already endorsed ACCF/AHA Task Force on Performance Measures:

- 0642: Cardiac Rehabilitation Referral from inpatient setting
- 0643: Cardiac Rehabilitation Referral from outpatient setting

Competing Measure(s)

**TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Usability?**

**Steering Committee: Overall, to what extent was the criterion, Usability, met?**

**Rationale:**

#### 4. FEASIBILITY

Comment [KP23]: 3b. The measure specifications are harmonized with other measures, and are applicable to multiple levels and settings.

Comment [KP24]: 16 Measure harmonization refers to the standardization of specifications for similar measures on the same topic (e.g., influenza immunization of patients in hospitals or nursing homes), or related measures for the same target population (e.g., eye exam and HbA1c for patients with diabetes), or definitions applicable to many measures (e.g., age designation for children) so that they are uniform or compatible, unless differences are dictated by the evidence. The dimensions of harmonization can include numerator, denominator, exclusions, and data source and collection instructions. The extent of harmonization depends on the relationship of the measures, the evidence for the specific measure focus, and differences in data sources.

Comment [KP25]: 3c. Review of existing endorsed measures and measure sets demonstrates that the measure provides a distinctive or additive value to existing NQF-endorsed measures (e.g., provides a more complete picture of quality for a particular condition or aspect of healthcare, is a more valid or efficient way to measure).
4a. Data Generated as a Byproduct of Care Processes

4a.1-2 How are the data elements that are needed to compute measure scores generated?
Other Data elements are generated by collecting and reviewing Program Policies and supporting documentation from departmental and medical records.

4b. Electronic Sources

4b.1 Are all the data elements available electronically? (elements that are needed to compute measure scores are in defined, computer-readable fields, e.g., electronic health record, electronic claims)
Yes

4b.2 If not, specify the near-term path to achieve electronic capture by most providers.

4c. Exclusions

4c.1 Do the specified exclusions require additional data sources beyond what is required for the numerator and denominator specifications?
No

4c.2 If yes, provide justification.

4d. Susceptibility to Inaccuracies, Errors, or Unintended Consequences

4d.1 Identify susceptibility to inaccuracies, errors, or unintended consequences of the measure and describe how these potential problems could be audited. If audited, provide results.
Because data collection involves review of program policies and submitted records, there is the possibility that programs are not being conducted in a manner consistent with their policies. In the future, site visits will be used to confirm compliance with policy, integrated into performance improvement for the AACVPR Certification/Recertification process.

4e. Data Collection Strategy/Implementation

4e.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data/missing data, timing/frequency of data collection, patient confidentiality, time/cost of data collection, other feasibility/implementation issues:
The AACVPR Program Certification process has been in place since 1999, and there are currently 1,147 certified cardiac rehabilitation programs in the United States. The certification process has evolved from a paper based system with subjective review by peers, including a level of state affiliate review, to an electronic based system with separate volunteer review, process/oversight, and contents groups. Over the past several years, process improvements have included using state volunteer groups as mentors to assure that data and elements are not missing, returning submitted material that does not meet HIPAA criteria, timing, frequency, sampling, patient confidentiality, etc.) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use).

4e.2 Costs to implement the measure (costs of data collection, fees associated with proprietary measures):
There is no significant cost to implementing this measure. In general, CR Program Directors already include these measures in their operational policies and procedures, and the additional cost would be to electronically submit the policies that support these measures for AACVPR certification, if that is the way that these measures are implemented. The cost of Certification in 2010 was $600 and Recertification was $500. The price will be raised to $650 and $550 respectively for 2011.

4e.3 Evidence for costs:
 AACVPR is a not-for-profit organization and the cost of certification and recertification is used to support the electronic submission process, staff time, and volunteer travel expenses needed to support the Certification/Recertification program.

**4e.4 Business case documentation:** See above for details. This is a relatively low-cost process, linked to a large body of evidence that CR can significantly improve patient outcomes.

**TAP/Workgroup:** What are the strengths and weaknesses in relation to the subcriteria for Feasibility?

| Steering Committee: Overall, to what extent was the criterion, Feasibility, met? |
|-----------------------------|-----------------------------|-----------------------------|
| **Rationale:** | | |

**RECOMMENDATION**

(for NQF staff use) Check if measure is untested and only eligible for time-limited endorsement.

| Steering Committee: Do you recommend for endorsement? |
|-----------------------------|-----------------------------|
