This form contains the measure information submitted by stewards. Blank fields indicate no information was provided. Attachments also may have been submitted and are provided to reviewers. The subcriteria and most of the footnotes from the evaluation criteria are provided in Word comments within the form and will appear if your cursor is over the highlighted area. Hyperlinks to the evaluation criteria and ratings are provided in each section.

**TAP/Workgroup** (if utilized): Complete all yellow highlighted areas of the form. Evaluate the extent to which each subcriterion is met. Based on your evaluation, summarize the strengths and weaknesses in each section.

**Note:** If there is no TAP or workgroup, the SC also evaluates the subcriteria (yellow highlighted areas).

**Steering Committee:** Complete all pink highlighted areas of the form. Review the workgroup/TAP assessment of the subcriteria, noting any areas of disagreement; then evaluate the extent to which each major criterion is met; and finally, indicate your recommendation for the endorsement. Provide the rationale for your ratings.

**Evaluation ratings of the extent to which the criteria are met**

- **C** = Completely (unquestionably demonstrated to meet the criterion)
- **P** = Partially (demonstrated to partially meet the criterion)
- **M** = Minimally (addressed BUT demonstrated to only minimally meet the criterion)
- **N** = Not at all (NOT addressed; OR incorrectly addressed; OR demonstrated to NOT meet the criterion)
- **NA** = Not applicable (only an option for a few subcriteria as indicated)

---

**MEASURE DESCRIPTIVE INFORMATION**

- **Measure Title:** Use of Iron Therapy When Indicated
- **Brief description of measure:** Percentage of all adult (>= 18 years old) dialysis patients with a serum ferritin < 100 ng/mL and a transferrin saturation percentage (TSAT) < 50% on at least one simultaneous measurement who received IV iron in the following three months.

**CONDITIONS FOR CONSIDERATION BY NQF**

Four conditions must be met before proposed measures may be considered and evaluated for suitability as voluntary consensus standards:

A. The measure is in the public domain or an intellectual property (measure steward agreement) is signed. **Public domain only applies to governmental organizations. All non-government organizations must sign a measure steward agreement even if measures are made publicly and freely available.**

A.1 Do you attest that the measure steward holds intellectual property rights to the measure and the right to use aspects of the measure owned by another entity (e.g., risk model, code set)? **Yes**

A.2 Indicate if Proprietary Measure (as defined in measure steward agreement):

A.3 Measure Steward Agreement: Government entity and in the public domain - no agreement necessary

A.4 Measure Steward Agreement attached:

B. The measure owner/steward verifies there is an identified responsible entity and process to maintain and

Rating: **C**=Completely; **P**=Partially; **M**=Minimally; **N**=Not at all; **NA**=Not applicable
update the measure on a schedule that is commensurate with the rate of clinical innovation, but at least every 3 years. Yes, information provided in contact section

C. The intended use of the measure includes both public reporting and quality improvement.

► Purpose: Public reporting, Internal quality improvement

D. The requested measure submission information is complete. Generally, measures should be fully developed and tested so that all the evaluation criteria have been addressed and information needed to evaluate the measure is provided. Measures that have not been tested are only potentially eligible for a time-limited endorsement and in that case, measure owners must verify that testing will be completed within 12 months of endorsement.

D.1 Testing: Yes, fully developed and tested
D.2 Have NQF-endorsement measures been reviewed to identify if there are similar or related measures? Yes

(for NQF staff use) Have all conditions for consideration been met?

Staff Notes to Steward (if submission returned):

Staff Notes to Reviewers (issues or questions regarding any criteria):

1. IMPORTANCE TO MEASURE AND REPORT

Extent to which the specific measure focus is important to making significant gains in health care quality (safety, timeliness, effectiveness, efficiency, equity, patient-centeredness) and improving health outcomes for a specific high impact aspect of healthcare where there is variation in or overall poor performance. *Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.* (evaluation criteria)

1a. High Impact

(for NQF staff use) Specific NPP goal:

1a.1 Demonstrated High Impact Aspect of Healthcare: Affects large numbers, Frequently performed procedure, High resource use

1a.2

1a.3 Summary of Evidence of High Impact: The measure focus is important because prudent use of IV iron in dialysis patients improves management of anemia; lowers the dose of ESA needed to maintain the Hgb in the target range; avoids potential harm of excess iron administration; and encourages optimum utilization of pharmacologic and laboratory resources.

Comment [KP1]: 1a. The measure focus addresses:
• a specific national health goal/priority identified by NQF’s National Priorities Partners; OR
• a demonstrated high impact aspect of healthcare (e.g., affects large numbers, leading cause of morbidity/mortality, high resource use (current and/or future), severity of illness, and patient/societal consequences of poor quality).
1c. Outcome or Evidence to Support Measure Focus

1c.1 Relationship to Outcomes (For non-outcome measures, briefly describe the relationship to desired outcome. For outcomes, describe why it is relevant to the target population): IV iron therapy can optimize the Hgb response to ESA therapy. The cut points for indicators of iron depletion are chosen because there is clear consensus that lower levels indicate iron depletion and the need for IV iron to optimize ESA effectiveness.

1c.2 Summary of Evidence (as described in the criteria; for outcomes, summarize any evidence that healthcare services/care processes influence the outcome): Recent clinical trials provide evidence that targeting higher Hgb levels when treating anemia in patients with chronic kidney disease (CKD) may increase the risk of adverse outcomes. The Trial to Reduce Cardiovascular Endpoints with Aranesp Therapy (TREAT) study found higher rates of stroke, thromboembolism, and cancer-related deaths in patients with CKD and diabetes who were treated to the higher Hgb target. The Correction of Hemoglobin and Outcomes in Renal Insufficiency (CHOIR) study [Singh AK, 2006] (CKD patients) and the Normal Hematocrit study [Besarab A, 1998] (dialysis patients at high

cardiovascular risk) both found higher rates of death and cardiovascular complications among patients treated to higher Hgb targets. Two meta-analyses, which included both dialysis and non-dialysis CKD studies, also supported these findings [Phrommintikul A, 2007; KDOQI, 2006]. Although the cause of higher event rates among patients randomized to higher Hgb targets remains incompletely understood, higher ESA doses have been implicated as a possible explanation, and recent opinion in the nephrology community has coalesced around strategies to limit ESA dose when possible. To this end, alternate methods to facilitate ESA-mediated erythropoiesis, and support Hgb levels with lower ESA doses, are increasingly recommended, and the judicious use of IV iron therapy remains central to this strategy [Kapoian T, 2008; Pizzi LT, 2008; Singh AK, 2010]. At the same time, the TEP recognizes evidence limitations with respect to long-term safety of IV iron therapy. As standard practice, IV iron dosing decisions are based on clinical measures of iron stores including ferritin and transferrin saturation (TSAT) levels. The proposed clinical performance measures (CPMs) leave most treatment decisions about IV iron dosing to the judgment of the practitioner, with the exception of values notably out of normal range. For example, no judgment is made about IV iron dosing to patients with ferritin in the 100 to 1200 ng/mL range or with TSAT <50%.

1c.5 Rating of strength/quality of evidence (also provide narrative description of the rating and by whom):
Overall, Grade B evidence. Randomized clinical trials were conducted in mainly in CKD patients not on dialysis.

1c.6 Method for rating evidence: United States Preventive Services Task Force (USPSTF)

1c.7 Summary of Controversy/Contradictory Evidence: There is no controversy over the importance of routine iron assessment in dialysis patients.

1c.9 Quote the Specific guideline recommendation (including guideline number and/or page number):
3.2.3 Targets of iron therapy
Sufficient iron should be administered to generally maintain the following indices of iron status during ESA treatment:

• 3.2.3.1 HD-CKD patients:
  • Serum ferritin > 200 ng/mL AND
  • TSAT > 20%, or CHr > 29 pg/cell

• 3.2.3.2 ND-CKD and PD-CKD patients:
  • Serum ferritin > 100 ng/mL AND
  • TSAT > 20%

3.2.4 Upper level of ferritin
There is insufficient evidence to recommend routine administration of IV iron if serum ferritin is greater than 500 ng/mL. When ferritin level is greater than 500 ng/mL, decisions regarding IV iron administration should weigh ESA responsiveness, Hgb and TSAT level, and the patient’s clinical status.

1c.11 National Guideline Clearinghouse or other URL: N/A

1c.12 Rating of strength of recommendation (also provide narrative description of the rating and by whom):
KDOQI Anemia Guidelines are opinion-based.

1c.13 Method for rating strength of recommendation (if different from USPSTF system, also describe rating and how it relates to USPSTF): N/A

1c.14 Rationale for using this guideline over others:
The proposed measure is designed to assure that IV iron is administered to patients who are iron-depleted. The serum ferritin level at which patients should be receiving IV iron was set at 100 ng/mL for HD and PD patients, rather than 100 ng/mL for PD patients and 200 ng/mL for HD patients (as per the KDOQI recommendations and the prior CPM). Though many providers give replacement doses of IV iron to HD patients with ferritin < 200 ng/mL, the cut-point of 100 ng/mL was chosen because this is a level below which there is clear consensus about iron deficiency for all dialysis patients receiving an ESA, i.e. the need for IV iron therapy to optimize Hgb response to ESA dosing. Further, the TEP acknowledges that the long-term safety of IV iron remains incompletely known, due to limitations in the literature. To this end, IV iron dosing in the 100 to 200 ng/mL ferritin range is left to the discretion of the practitioner. The TSAT cut-point was increased from 20 to 50%. The TEP felt that TSAT (e.g. < 20%) should not be used independently to determine if a patient is iron deficient, due to high within-subject and between-assay variability, and the influence of inflammation on lowering TSAT levels. Rather, the cut-point of 50% was chosen because iron is typically withheld above this value due to concerns about iron overload. The TEP recognized that very few patients have both ferritin < 100 ng/mL and TSAT > 50%.

The revised measure evaluates IV iron use subsequent to a laboratory determination of iron deficiency, rather than at any time during the study period, to measure more accurately whether clinicians are responding appropriately to laboratory evidence of iron deficiency. CHr was dropped from the measure because the utility of measuring CHr instead of TSAT for the assessment of iron stores is uncertain. Furthermore, the practice of CHr measurement remains uncommon in United States (US) dialysis facilities.

2. SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable
### 2a. MEASURE SPECIFICATIONS

**S.1** Do you have a web page where current detailed measure specifications can be obtained?

2a. Precisely Specified

#### 2a.1 Numerator Statement (Brief, text description of the numerator - what is being measured about the target population, e.g. target condition, event, or outcome):

Number of patients in the denominator who received IV iron within three months following the first occurrence of serum ferritin < 100 ng/mL and TSAT < 50% during the study period.

#### 2a.2 Numerator Time Window (The time period in which cases are eligible for inclusion in the numerator):

Rolling three-month study period.

#### 2a.3 Numerator Details (All information required to collect/calculate the numerator, including all codes, logic, and definitions):

The numerator will be determined by counting the patients in the denominator who meet the following criteria: IV Iron Prescribed is equal to “Yes” in any of the three months following the first occurrence of Serum Ferritin <100 ng/mL and Iron Saturation Percentage < 50% on simultaneous measurements.

#### 2a.4 Denominator Statement (Brief, text description of the denominator - target population being measured):

All adult (>=18 years) hemodialysis (HD) and peritoneal dialysis (PD) patients in the facility for the entire three-month reporting period who had serum ferritin <100 ng/mL and TSAT <50% on at least one simultaneous measurement reported during the three-month study period. Simultaneous measurements are those reported with the same collection date.

#### 2a.5 Target population gender: Female, Male

#### 2a.6 Target population age range: Adults 18 years or older.

#### 2a.7 Denominator Time Window (The time period in which cases are eligible for inclusion in the denominator):

Rolling three-month study period.

#### 2a.8 Denominator Details (All information required to collect/calculate the denominator - the target population being measured - including all codes, logic, and definitions):

Patients are included in the denominator if they are >= 18 years old, on dialysis and in the facility for the entire study period, and had a serum ferritin value < 100 ng/mL and an iron saturation percentage value < 50% on a simultaneous measurement during the study period.

The patient’s age will be determined by subtracting the patient’s date of birth from the first day of the study period. Patients in a facility and on dialysis for the entire study period are defined as follows: Admit Date to the specified facility is prior or equal to the first day of the study period, AND the patient has not been discharged (Discharge Date is null or blank), OR Discharge Date from the facility is greater than or equal to the last day of the study period AND Primary Type of Treatment is HD, continuous ambulatory peritoneal dialysis (CAPD) or continuous cycling peritoneal dialysis (CCPD) in each month of the study period. In addition, the patient must have the following: Serum Ferritin < 100 ng/mL AND Iron Saturation Percentage <50% AND Serum Ferritin Collection Date is equal to Iron Saturation Percentage Collection Date.

#### 2a.9 Denominator Exclusions (Brief text description of exclusions from the target population):

1. Patients with mean hemoglobin (Hgb) > 12g/dl who did not receive an erythropoietin stimulating agent (ESA) during the 3 month study period. The last recorded Hgb value of each month of the study period will be used in calculating the mean.

**Comment [KP0]:** 2a. The measure is well defined and precisely specified so that it can be implemented consistently within and across organizations and allow for comparability. The required data elements are of high quality as defined by NQF’s Health Information Technology Expert Panel (HITEP).

**Comment [k9]:** 11 Risk factors that influence outcomes should not be specified as exclusions.

12 Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.
2. Patients with documented history of anaphylaxis to IV iron products.

2a.10 Denominator Exclusion Details (All information required to collect exclusions to the denominator, including all codes, logic, and definitions):
Patients are excluded from the measure if they have a documented history of anaphylaxis, which would be determined from a new CROWNWeb data element. Patients are also excluded if they have a mean Hgb > 12 g/dL and ESA prescribed equals ‘No’ for all three months of the study period. The mean Hgb is calculated from the last recorded Hgb value for each of the three study months.

2a.11 Stratification Details/Variables (All information required to stratify the measure including the stratification variables, all codes, logic, and definitions):
N/A

2a.12-13 Risk Adjustment Type: No risk adjustment necessary

2a.14 Risk Adjustment Methodology/Variables (List risk adjustment variables and describe conceptual models, statistical models, or other aspects of model or method):
N/A

2a.15-17 Detailed risk model available Web page URL or attachment:

2a.18-19 Type of Score: Rate/proportion
2a.20 Interpretation of Score: Better quality = Higher score
2a.21 Calculation Algorithm (Describe the calculation of the measure as a flowchart or series of steps):
Patients are included in the denominator if they are >= 18 years old, are on dialysis, and in the facility for the entire study period, and had a serum ferritin value < 100 ng/mL and an iron saturation percentage value < 50% on a simultaneous measurement during the study period.

The patient's age will be determined by subtracting the patient’s date of birth from the first day of the study period. Patients in a facility and on dialysis for the entire study period are defined as follows: Admit Date to the specified facility is prior or equal to the first day of the study period, AND the patient has not been discharged (Discharge Date is null or blank), OR Discharge Date from the facility is greater than or equal to the last day of the study period AND Primary Type of Treatment is Hemodialysis, CAPD or CCPD in each month of the study period. In addition, the patient must have the following: Serum Ferritin < 100 ng/mL AND Iron Saturation Percentage < 50% AND Serum Ferritin Collection Date is equal to Iron Saturation Percentage Collection Date.

The numerator will be determined by counting the patients in the denominator who meet the following criteria: IV Iron Prescribed is equal to 'Yes' in any of the three months following the first occurrence of Serum Ferritin <100 ng/mL and Iron Saturation Percentage < 50% on simultaneous measurements.

2a.22 Describe the method for discriminating performance (e.g., significance testing):
The performance of the facility will be compared to state, Network and national performance.

2a.23 Sampling (Survey) Methodology If measure is based on a sample (or survey), provide instructions for obtaining the sample, conducting the survey and guidance on minimum sample size (response rate):
N/A

2a.24 Data Source (Check the source(s) for which the measure is specified and tested)
Electronic clinical data

2a.25 Data source/data collection instrument (identify the specific data source/data collection instrument, e.g. name of database, clinical registry, collection instrument, etc.):
CROWNWeb

2a.26-28 Data source/data collection instrument reference web page URL or attachment: URL
http://www.projectcrownweb.org/crown/index.php

2a.29-31 Data dictionary/code table web page URL or attachment: URL

2a.32-35 Level of Measurement/Analysis (Check the level(s) for which the measure is specified and
2b. Reliability testing

2b.1 Data/sample (description of data/sample and size): The measure has not been tested for reliability.

2b.2 Analytic Method (type of reliability & rationale, method for testing): Since the data are submitted electronically, we anticipate highly reliable measures. No elements for the measure would be abstracted from records, and no elements would be susceptible to inter-rater variability. Reliability testing of the CROWNweb data has not yet been performed although monthly reports are currently being distributed to facilities participating in Phase 1 and 2 to compare the metrics to their own data.

2b.3 Testing Results (reliability statistics, assessment of adequacy in the context of norms for the test conducted): N/A

2c. Validity testing

2c.1 Data/sample (description of data/sample and size): N/A

2c.2 Analytic Method (type of validity & rationale, method for testing): Face validity is the only validity assessed, therefore testing is not applicable.

2c.3 Testing Results (statistical results, assessment of adequacy in the context of norms for the test conducted): N/A

2d. Exclusions Justified

2d.1 Summary of Evidence supporting exclusion(s): Patients are excluded from the measure if they have Hgb greater than 12 g/dL (i.e., Hgb above target range) without treatment with an ESA, or if they have a documented history of anaphylaxis to IV iron products. The two exclusions from the measure are expected to include a small number of patients. However, at each facility, the denominator for the measure is likely to be small and therefore if patients are not excluded but should not be receiving IV iron for a valid reason then the lack of exclusion could have a large impact on the measure for the facility.

2d.2 Citations for Evidence: N/A

2d.3 Data/sample (description of data/sample and size): N/A

2d.4 Analytic Method (type analysis & rationale): N/A

2d.5 Testing Results (e.g., frequency, variability, sensitivity analyses): N/A

2e. Risk Adjustment for Outcomes/ Resource Use Measures

2e.1 Data/sample (description of data/sample and size): N/A

2e.2 Analytic Method (type of analysis & rationale): N/A

2e.3 Testing Results (e.g., frequency, variability, sensitivity analyses): N/A

2e.4 Risk Adjustment for Outcomes/ Resource Use Measures: N/A
### 2f. Identification of Meaningful Differences in Performance

#### 2f.1 Data/sample from Testing or Current Use (description of data/sample and size): A test calculation of the measure was performed using CROWNWeb Phase II data from July-September 2009. The calculation included data for 2568 facilities.

#### 2f.2 Methods to identify statistically significant and practically/meaningfully differences in performance (type of analysis & rationale): The distribution of percent of patients meeting measure criteria by facility was examined.

#### 2f.3 Provide Measure Scores from Testing or Current Use (description of scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance): In the test calculation of the measure using July-September 2009 CROWNWeb data, the facility-level mean was 64%. The median, 25th, and 75th percentiles were 67%, 40% and 100%, respectively.

### 2g. Comparability of Multiple Data Sources/Methods

#### 2g.1 Data/sample (description of data/sample and size): N/A

#### 2g.2 Analytic Method (type of analysis & rationale): N/A

#### 2g.3 Testing Results (risk model performance metrics): N/A

#### 2g.4 If outcome or resource use measure is not risk adjusted, provide rationale: N/A

### 3a. Meaningful, Understandable, and Useful Information

#### 3a.1 Current Use: Not in use but testing completed

Clinical care processes typically include multiple steps: assess → identify problem/potential problem → choose/plan intervention (with patient input) → provide intervention → evaluate impact on health status. If the measure focus is one step in such a multi-step process, the step with the greatest effect on the desired outcome should be selected as the focus of measurement. For example, although assessment of immunization status and recommending immunization are necessary steps, they are not sufficient to achieve the desired impact on health status - patients must be vaccinated to achieve immunity. This does not preclude consideration of measures of preventive screening interventions where there is a strong link with desired outcomes (e.g., mammography) or measures for multiple care processes that affect a single outcome.

Clinically necessary measure exclusions are identified and must be:
• supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; AND
• a clinically appropriate exception (e.g., contraindication) to eligibility for the measure focus; AND
• precisely defined and specified:
  – if there is substantial variability in exclusions across providers, the measure is specified so that exclusions are computable and the effect on the measure is transparent (i.e., impact clearly delineated, such as number of cases excluded, exclusion rates by type of exclusion);
if patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that it strongly impacts performance on the measure and the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately).

For outcome measures and other measures (e.g., resource use) when indicated:
• an evidence-based risk-adjustment strategy (e.g., risk models, risk stratification) is specified and is based on patient clinical factors that influence the measured outcome (but not disparities in care) and are present at start of care; OR rationale/data support no risk adjustment.
