This form contains the measure information submitted by stewards. Blank fields indicate no information was provided. Attachments also may have been submitted and are provided to reviewers. The subcriteria and most of the footnotes from the evaluation criteria are provided in Word comments within the form and will appear if your cursor is over the highlighted area. Hyperlinks to the evaluation criteria and ratings are provided in each section.

**TAP/Workgroup (if utilized):** Complete all yellow highlighted areas of the form. Evaluate the extent to which each subcriterion is met. Based on your evaluation, summarize the strengths and weaknesses in each section.

**Note:** If there is no TAP or workgroup, the SC also evaluates the subcriteria (yellow highlighted areas).

**Steering Committee:** Complete all pink highlighted areas of the form. Review the workgroup/TAP assessment of the subcriteria, noting any areas of disagreement; then evaluate the extent to which each major criterion is met; and finally, indicate your recommendation for the endorsement. Provide the rationale for your ratings.

**Evaluation ratings of the extent to which the criteria are met**

- **C** = Completely (unquestionably demonstrated to meet the criterion)
- **P** = Partially (demonstrated to partially meet the criterion)
- **M** = Minimally (addressed BUT demonstrated to only minimally meet the criterion)
- **N** = Not at all (NOT addressed; OR incorrectly addressed; OR demonstrated to NOT meet the criterion)
- **NA** = Not applicable (only an option for a few subcriteria as indicated)

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable
The intended use of the measure includes both public reporting and quality improvement.

**Purpose:** Public reporting, Internal quality improvement

---

**1. IMPORTANCE TO MEASURE AND REPORT**

Extent to which the specific measure focus is important to making significant gains in health care quality (safety, timeliness, effectiveness, efficiency, equity, patient-centeredness) and improving health outcomes for a specific high impact aspect of healthcare where there is variation in or overall poor performance. Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.

1a. High Impact

**Demonstrated High Impact Aspect of Healthcare:** Leading cause of morbidity/mortality

**Summary of Evidence of High Impact:** In the United States, a significant proportion of HD patients are subjected to the practice of sodium profiling in dialysis facilities to ensure stability of the HD session. While the practice tends to achieve this aim, it exposes the patient to a sodium load in the process, even though intent is to lower the serum sodium by the end of the treatment. Elimination of this practice over time in the vast majority of HD patients will prevent this repetitive sodium loading which has the potential for cumulative harm in the form of excessive thirst, interdialytic weight gain, hypertension, with worsening left ventricular hypertrophy, heart failure, etc. The recent European best practice guidelines do not recommend the use of sodium profiling for these reasons. The KDOQI (2006) panel had also cautioned against the potential deleterious effects of this practice.

**Citations for Evidence of High Impact:**
### 1b. Opportunity for Improvement

**1b.1 Benefits (improvements in quality) envisioned by use of this measure:** In the United States, a significant proportion of hemodialysis (HD) patients are subjected to the practice of sodium profiling in dialysis facilities to ensure stability of the HD session especially in those prone to intradialytic hypotension. While the practice tends to achieve this aim, it exposes the patient to a sodium load in the process, even though intent is lower the serum sodium by the end of the treatment. Elimination of this practice over time in the vast majority of HD patients will prevent this repetitive sodium loading which has the potential for cumulative harm in the form of excessive thirst, interdialytic weight gain, hypertension, worsening left ventricular hypertrophy, and heart failure.

**1b.2 Summary of data demonstrating performance gap (variation or overall poor performance) across providers:** There are no published nationally representative studies estimating the prevalence of this practice in the United States. A recent investigation of data from the Dialysis Outcomes and Practice Patterns Study (DOPPS) at the 2010 European Dialysis and Transplant Association meeting reported on the international prevalence of this practice (highest in United States and Canada) and its long term adverse consequences (Saran et al 2010).

**1b.3 Citations for data on performance gap:** N/A

**1b.4 Summary of Data on disparities by population group:** Disparities for sodium profiling by population group have not been reported in the literature.

**1b.5 Citations for data on Disparities:** N/A

### 1c. Outcome or Evidence to Support Measure Focus

**1c.1 Relationship to Outcomes (For non-outcome measures, briefly describe the relationship to desired outcome. For outcomes, describe why it is relevant to the target population):** Excess exposure to sodium by way of dietary intake or exposure to sodium in the dialysate is likely the most important contributor to excessive interdialytic fluid weight gain and hypertension among dialysis patients with potential for long term adverse outcomes.

**1c.2 Type of Evidence:** Observational study, Evidence-based guideline, Expert opinion

**1c.4 Summary of Evidence (as described in the criteria; for outcomes, summarize any evidence that healthcare services/care processes influence the outcome):** Excess exposure to sodium by way of dietary intake or exposure to sodium in the dialysate is likely the most important contributor to excessive interdialytic fluid weight gain and hypertension among dialysis patients with potential for long term adverse outcomes.

**1c.5 Rating of strength/quality of evidence (also provide narrative description of the rating and by whom):**

---

**Citations for data on disparities:**

---

**Citations for data on performance gap:**

---

**Citation for data on disparities:**

- NQF #1434

---

**Citation for data on performance gap:**

---

**Citation for data on disparities:**

Observational studies (Level B evidence, as rated by the Fluid Weight Management Clinical Technical Expert Panel using an assessment scale similar to KDOQI).

1c.6 Method for rating evidence: The clinical TEP followed similar methods of evidence assessment as that used by the KDOQI clinical practice guidelines.

1c.7 Summary of Controversy/Contradictory Evidence: While short-term studies suggest that sodium profiling is relatively successful at preventing intradialytic hypotensive episodes, it has been associated with increased post-dialysis thirst and higher interdialytic weight gain. No large-scale randomized trials have been conducted to assess long-term benefits or adverse consequences of sodium profiling. There is also non-availability of large observational outcomes studies in this regard.

1c.8 Citations for Evidence (other than guidelines):

1c.9 Quote the Specific guideline recommendation (including guideline number and/or page number): This measure is related to the 2006 KDOQI guideline, which suggests that the practice of sodium profiling should be avoided: 5.3 - Increasing positive sodium balance by “sodium profiling” or using a high dialysate sodium concentration should be avoided. (Evidence Level B)

1c.11 National Guideline Clearinghouse or other URL: N/A

1c.12 Rating of strength of recommendation (also provide narrative description of the rating and by whom): The 2006 KDOQI guidelines were based on Work Group consensus.

1c.13 Method for rating strength of recommendation (if different from USPSTF system, also describe rating and how it relates to USPSTF): N/A

1c.14 Rationale for using this guideline over others: There are no other known guidelines pertaining to sodium profiling in dialysis patients.
### 2. SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ([evaluation criteria](#)).

### 2a. MEASURE SPECIFICATIONS

#### 2a. Precisely Specified

<table>
<thead>
<tr>

Comment [k11]: 8 Examples of reliability testing include, but are not limited to: inter-rater or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing may address the data items or final measure score.

Comment [KP12]: 2c. Validity testing demonstrates that the measure reflects the quality of care provided, adequately distinguishing good and poor quality. If face validity is the only validity addressed, it is systematically assessed.

Comment [k13]: 9 Examples of validity testing include, but are not limited to: determining if measure scores adequately distinguish between providers known to have good or poor quality assessed by another valid method; correlation of measure scores with another valid indicator of quality for the specific topic; ability of measure scores to predict scores on some other related valid measure; content validity for multi-item scales/tests. Face validity is a subjective assessment by experts of whether the measure reflects the quality of care (e.g., whether the proportion of patients with BP < 140/90 is a marker of quality). If face validity is the only validity addressed, it is systematically assessed (e.g., ratings by relevant stakeholders).

Comment [KP14]: 2d. Clinically necessary measure exclusions are identified and must be: supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; AND...

Comment [k15]: 10 Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, sensitivity analyses with and without the exclusion, and variability of exclusions across providers.

Comment [KP16]: 2e. For outcome measures and other measures (e.g., resource use) when indicated:

- an evidence-based risk-adjustment strategy (e.g., risk models, risk stratification) is specified and is based on patient clinical factors that influence the measured outcome.  

Comment [k17]: 13 Risk models should not obscure disparities in care for populations by including factors that are associated with differences/inequalities in care such as race, socioeconomic status, gender (e.g., poorer treatment outcomes of African American men with prostate cancer, inequalities in tree...)

Comment [KP18]: 2f. Data analysis demonstrates that methods for scoring and analysis of the specified measure allow for identification of statistically significant and practically/clinically meaningful differences in performance.

Comment [k19]: 14 With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage...
2g. Comparability of Multiple Data Sources/Methods

2g.1 Data/sample (description of data/sample and size): Multiple data sources are not allowed for this measure and therefore testing is not applicable.

2g.2 Analytic Method (type of analysis & rationale): N/A

2g.3 Testing Results (e.g., correlation statistics, comparison of rankings): N/A

2h. Disparities in Care

2h.1 If measure is stratified, provide stratified results (scores by stratified categories/cohorts): N/A

2h.2 If disparities have been reported/identified, but measure is not specified to detect disparities, provide follow-up plans: N/A

TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Scientific Acceptability of Measure Properties?

Steering Committee: Overall, to what extent was the criterion, Scientific Acceptability of Measure Properties, met? Rationale:

3. USABILITY

Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (evaluation criteria)

3a. Meaningful, Understandable, and Useful Information

3a.1 Current Use: Testing not yet completed

3a.2 Use in a public reporting initiative (disclosure of performance results to the public at large) (if used in a public reporting initiative, provide name of initiative(s), locations, Web page URL(s). If not publicly reported, state the plans to achieve public reporting within 3 years): This measure is currently not publically reported. This measure could be considered for public reporting on Medicare’s Dialysis Facility Compare (DFC) website in the future.

3a.3 If used in other programs/initiatives (if used in quality improvement or other programs/initiatives, name of initiative(s), locations, Web page URL(s). If not used for QI, state the plans to achieve use for QI within 3 years): None.

Testing of Interpretability (Testing that demonstrates the results are understood by the potential users for public reporting and quality improvement)

3a.4 Data/sample (description of data/sample and size): Testing of interpretability has not been performed.

3a.5 Methods (e.g., focus group, survey, QI project): N/A

3a.6 Results (qualitative and/or quantitative results and conclusions): N/A

3b/3c. Relation to other NQF-endorsed measures

3b.1 NQF # and Title of similar or related measures:

Comment [KP20]: 2g. If multiple data sources/methods are allowed, there is demonstration they produce comparable results.

Comment [KP21]: 2h. If disparities in care have been identified, measure specifications, scoring, and analysis allow for identification of disparities through stratification of results (e.g., by race, ethnicity, socioeconomic status, gender); OR rationale/data justifies why stratification is not necessary or not feasible.

Comment [KP22]: 3a. Demonstration that information produced by the measure is meaningful, understandable, and useful to the intended audience(s) for both public reporting (e.g., focus group, cognitive testing) and informing quality improvement (e.g., quality improvement initiatives). An important outcome that may not have an identified improvement strategy still can be useful for informing quality improvement by identifying the need for and stimulating new approaches to improvement.
### 3b. Harmonization

If this measure is related to measure(s) already endorsed by NQF (e.g., same topic, but different target population/setting/data source or different topic but same target population):

#### 3b.2 Are the measure specifications harmonized? If not, why?

<table>
<thead>

</tbody>
</table>

#### 4d. Susceptibility to Inaccuracies, Errors, or Unintended Consequences

Identify susceptibility to inaccuracies, errors, or unintended consequences of the measure and describe how these potential problems could be audited. If audited, provide results.

The D-TEP suggested that for true quantification of sodium profiling, data elements for minimum/maximum sodium concentration, profile type (step change, linear, or exponential), and the time over which modeling is performed would be required. Because these data are not collected, the use of sodium profiling must be abstracted from patient treatment records.

</tbody>
</table>
4e. Data Collection Strategy/Implementation

4e.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data/missing data, timing/frequency of data collection, patient confidentiality, time/cost of data collection, other feasibility/implementation issues:

The measure was evaluated by a C-TEP and D-TEP with representatives from both large and small dialysis organizations. Although the D-TEP suggested that facilities entering data manually into CROWNWeb may be subjected to data entry burden for this measure, the C-TEP felt that the importance of the measure justified the increased data burden.

4e.2 Costs to implement the measure (costs of data collection, fees associated with proprietary measures):

The estimated data collection burden and associated cost estimates for comparable measures are presented in Tables 1-3 in the Federal Register. Vol. 73, No. 73 page 20469. URL: http://www.cms.gov/CFCsAndCoPs/downloads/ESRDfinalrule0415.pdf

4e.3 Evidence for costs:

See above reference to Federal Register.

4e.4 Business case documentation: The gradual elimination of the practice of sodium profiling on the dialysis units will likely not result in significant increase in cost to the dialysis facilities, and in fact could turn out to be a cost effective intervention in view of its potential longer term benefits. In the short term, however, patients who would otherwise qualify for sodium profiling, may require longer dialysis sessions with slower ultrafiltration to ensure stability during the dialysis procedure and this could increase cost for the facility. This topic has not been subjected to formal cost effectiveness analysis.

TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Feasibility?

Steering Committee: Overall, to what extent was the criterion, Feasibility, met?

Rationale:

RECOMMENDATION

(for NQF staff use) Check if measure is untested and only eligible for time-limited endorsement.

Steering Committee: Do you recommend for endorsement?

1c. The measure focus is:

- an outcome (e.g., morbidity, mortality, function, health-related quality of life) that is relevant to, or associated with, a national health goal/priority, the condition, population, and/or care being addressed;

OR

- if an intermediate outcome, process, structure, etc., there is evidence that supports the specific measure focus as follows:
  - Intermediate outcome - evidence that the measured intermediate outcome (e.g., blood pressure, Hba1c) leads to improved health/avoidance of harm or cost/benefit.
  - Process - evidence that the measured clinical or administrative process leads to improved health/avoidance of harm and if the measure focus is on one step in a multi-step care process, it measures the step that has the greatest effect on improving the specified desired outcome(s).
  - Structure - evidence that the measured structure supports the consistent delivery of effective processes or access that lead to improved health/avoidance of harm or cost/benefit.
  - Patient experience - evidence that an association exists between the measure of patient experience of health care and the outcomes, values and preferences of individuals/ the public.
  - Access - evidence that an association exists between access to a health service and the outcomes of, or experience with, care.
  - Efficiency - demonstration of an association between the measured resource use and level of performance with respect to one or more of the other five IOM aims of quality.

4 Clinical care processes typically include multiple steps: assess → identify problem/potential problem → choose/plan intervention (with patient input) → provide intervention → evaluate impact on health status. If the measure focus is one step in such a multi-step process, the step with the greatest effect on the desired outcome should be selected as the focus of measurement. For example, although assessment of immunization status and recommending immunization are necessary steps, they are not sufficient to achieve the desired impact on health status - patients must be vaccinated to achieve immunity. This does not preclude consideration of measures of preventive screening interventions where there is a strong link with desired outcomes (e.g., mammography) or measures for multiple care processes that affect a single outcome.

3 The strength of the body of evidence for the specific measure focus should be systematically assessed and rated (e.g., USPSTF grading system http://www.ahrq.gov/clinic/uspsf07/methods/benefit.htm). If the USPSTF grading system was not used, the grading system is explained including how it relates to the USPSTF grades or why it does not. However, evidence is not limited to quantitative studies and the best type of evidence depends upon the question being studied (e.g., randomized controlled trials appropriate for studying drug efficacy are not well suited for complex system changes). When qualitative studies are used, appropriate qualitative research criteria are used to judge the strength of the evidence.

9 Examples of validity testing include, but are not limited to: determining if measure scores adequately distinguish between providers known to have good or poor quality assessed by another valid method; correlation of measure scores with another valid indicator of quality for the specific topic; ability of measure scores to predict scores on some other related valid measure; content validity for multi-item scales/tests. Face validity is a subjective assessment by experts of whether the measure reflects the quality of care (e.g., whether the proportion of patients with BP < 140/90 is a marker of quality). If face validity is the only validity addressed, it is systematically assessed (e.g., ratings by relevant stakeholders) and the measure is judged to represent quality care for the specific topic and that the measure focus is the most important aspect of quality for the specific topic.

2d. Clinically necessary measure exclusions are identified and must be:

- supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; AND
- a clinically appropriate exception (e.g., contraindication) to eligibility for the measure focus; AND
if patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that it
strongly impacts performance on the measure and the measure must be specified so that the information about
patient preference and the effect on the measure is transparent (e.g., numerator category computed separately,
denominator exclusion category computed separately).

2e. For outcome measures and other measures (e.g., resource use) when indicated:
• an evidence-based risk-adjustment strategy (e.g., risk models, risk stratification) is specified and is based on
  patient clinical factors that influence the measured outcome (but not disparities in care) and are present at
  start of care;** OR
  rationale/data support no risk adjustment.

13 Risk models should not obscure disparities in care for populations by including factors that are associated with
differences/inequalities in care such as race, socioeconomic status, gender (e.g., poorer treatment outcomes of
African American men with prostate cancer, inequalities in treatment for CVD risk factors between men and
women). It is preferable to stratify measures by race and socioeconomic status rather than adjusting out
differences.

14 With large enough sample sizes, small differences that are statistically significant may or may not be practically
or clinically meaningful. The substantive question may be, for example, whether a statistically significant
difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g.,
74% v. 75%) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of
care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall poor performance may not
demonstrate much variability across providers.
