NQF #0345 Accidental Puncture or Laceration Rate (PSI 15)

**National Quality Forum**

*Measure Submission and Evaluation Worksheet 5.0*

This form contains the information submitted by measure developers/stewards, organized according to NQF’s measure evaluation criteria and process. The evaluation criteria, evaluation guidance documents, and a blank online submission form are available on the submitting standards web page.

**NQF #: 0345**  
**NQF Project:** Patient Safety Measures-Complications Project  
(for Endorsement Maintenance Review)  
**Original Endorsement Date:** May 15, 2008  
**Most Recent Endorsement Date:** May 15, 2008

### BRIEF MEASURE INFORMATION

**De.1 Measure Title:** Accidental Puncture or Laceration Rate (PSI 15)

**Co.1.1 Measure Steward:** Agency for Healthcare Research and Quality

**De.2 Brief Description of Measure:** Percent of discharges among cases meeting the inclusion and exclusion rules for the denominator with ICD-9-CM code denoting accidental cut, puncture, perforation, or laceration during a procedure in any secondary diagnosis field.

**2a1.1 Numerator Statement:** Discharges among cases meeting the inclusion and exclusion rules for the denominator with ICD-9-CM code denoting accidental cut, puncture, perforation, or laceration during a procedure in any secondary diagnosis field.

**2a1.4 Denominator Statement:** All surgical and medical discharges age 18 years and older defined by specific DRGs or MS-DRGs.

**2a1.8 Denominator Exclusions:** Exclude cases:
- with principal diagnosis denoting accidental cut, puncture, perforation, or laceration or secondary diagnosis present on admission
- MDC 14 (pregnancy, childbirth, and puerperium)
- with ICD-9-CM code for spine surgery
- with missing gender (SEX=missing), age (AGE=missing), quarter (DQTR=missing), year (YEAR=missing) or principal diagnosis (DX1=missing)

**1.1 Measure Type:** Outcome

**2a1.25-26 Data Source:** Administrative claims

**2a1.33 Level of Analysis:** Facility

**1.2-1.4 Is this measure paired with another measure?** No

**De.3 If included in a composite, please identify the composite measure (title and NQF number if endorsed):**

0531 Patient Safety for Selected Indicators (composite)

### STAFF NOTES (issues or questions regarding any criteria)

**Comments on Conditions for Consideration:**

**Is the measure untested?** Yes [ ] No [X]  
If untested, explain how it meets criteria for consideration for time-limited endorsement:

1a. Specific national health goal/priority identified by DHHS or NPP addressed by the measure (check De.5):

5. Similar/related endorsed or submitted measures (check 5.1):

**Other Criteria:**

**Staff Reviewer Name(s):**
**1. IMPACT, OPPORTUNITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT**

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriterias must be met to pass this criterion. See guidance on evidence. **Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.** (evaluation criteria)

### 1a. High Impact:

<table>
<thead>
<tr>
<th>H</th>
<th>M</th>
<th>L</th>
<th>I</th>
</tr>
</thead>
</table>

(The measure directly addresses a specific national health goal/priority identified by DHHS or NPP, or some other high impact aspect of healthcare.)

#### De.4 Subject/Topic Areas (Check all the areas that apply):
- Surgery: General Surgery

#### De.5 Cross Cutting Areas (Check all the areas that apply):
- Safety: Complications

#### 1a.1 Demonstrated High Impact Aspect of Healthcare:
- Affects large numbers, Patient/societal consequences of poor quality

#### 1a.2 If “Other,” please describe:

#### 1a.3 Summary of Evidence of High Impact (**Provide epidemiologic or resource use data**):

Compared to other PSI, the four year trend for this QI was consistent, and it was one of the most frequent QIs in a sample of Veteran’s Administration data, with risk-adjusted rate of 4.29 per 1,000 eligible patients in FY 2004.a Similar findings have been reported by community hospitals in the Healthcare Cost and Utilization Project, with a risk-adjusted rate of 2.83 per 1,000 eligible patients in 2008 (http://qualityindicators.ahrq.gov/Downloads/Software/SAS/V43/Comparative%20Data%20PSI%204.3.pdf). About 16,533 of these events are estimated to have occurred in US community hospitals in 2008. International data from the Organization for Economic Cooperation and Development show substantial variation across countries, with a maximum rate of 4.03 per 1,000 eligible patients from Canada.c

Cases from the Nationwide Inpatient Sample that were flagged by this PSI had 2.2% excess mortality, 1.3 days of excess hospitalization, and $8,300 in excess hospital charges, relative to carefully matched controls that were not flagged.e This finding was confirmed in the Veterans Affairs hospital system, where cases that were flagged by this PSI had 3.2% excess mortality, 1.4-3.1 days of excess hospitalization, and $3,359-6,880 in excess hospital costs, relative to carefully matched controls that were not flagged.b In another study based on State Inpatient Databases from seven states that permit linkage of serial hospitalizations, this indicator was associated with relative risk ratios of 1.52 for inpatient death, 1.16 for readmission within three months, and 1.25 for readmission within one month (after adjusting for age, gender, payer, comorbidities, and specific surgical DRGs, and APR-DRG severity levels).d

#### 1a.4 Citations for Evidence of High Impact cited in 1a.3:

(c) Drösl er SE, Romano PS, Tancredi DJ, Klazinga NS. International comparability of Patient Safety Indicators in 15 OECD member countries: A methodological approach of adjustment by secondary diagnoses. Health Serv Res 2011; Jul 15. [Epub ahead of print].

### 1b. Opportunity for Improvement:

<table>
<thead>
<tr>
<th>H</th>
<th>M</th>
<th>L</th>
<th>I</th>
</tr>
</thead>
</table>

(There is a demonstrated performance gap - variability or overall less than optimal performance)

#### 1b.1 Briefly explain the benefits (improvements in quality) envisioned by use of this measure:

This indicator is intended to flag cases of complications that arise due to technical difficulties in medical care; specifically those involving an accidental puncture or laceration.

#### 1b.2 Summary of Data Demonstrating Performance Gap (**Variation or overall less than optimal performance across providers**):

**[For Maintenance – Descriptive statistics for performance results for this measure - distribution of scores for measured entities by**
In regard to figures below:

**Health outcome – rationale supports relationship to at least one healthcare structure, process, intervention, or service**

1c.1 **Structure-Process-Outcome Relationship** *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process-health outcome; intermediate clinical outcome-health outcome):* Accidental laceration or puncture is a health outcome measure. This measure captures an injury to an organ (e.g., bowel, bladder, liver, diaphragm) or blood vessel that was entirely unintended and was NOT due to an underlying disease process. This definition would be met if (for example) placement of a retractor underneath the symphysis pubis accidentally enters the bladder. Another example would be use of a cautery device or scissors to dissect a tissue plane that errantly causes an injury to underlying bowel. The rationale for this measure is that these injuries have adverse consequences for patients, and are often preventable. The exact proportion of PSI 15 events that is preventable, with optimal surgical technique, is unknown. However, in one series of 170 confirmed cases (based on earlier version of the indicator that did not exclude spinal surgery), 51 (30%) involved enterotomy or other perforation of the gastrointestinal tract, 33 (19%) involved a dural tear, 27 (16%) involved vascular injury, 7 involved the heart or coronary arteries, 5 involved the ureter or kidney, 3 involved the biliary tract, and 2 involved other structures (Utter GH, et al. Positive predictive value of the AHRQ accidental puncture or laceration patient safety indicator. Ann Surg 2009; 250(6):1041-5).

1c.2-3 **Type of Evidence** *(Check all that apply):*
Selected individual studies (rather than entire body of evidence)

1c.4 **Directness of Evidence to the Specified Measure** *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population):* Not applicable

1c.5 **Quantity of Studies in the Body of Evidence** *(Total number of studies, not articles):* Not applicable

1c.6 **Quality of Body of Evidence** *(Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* Not applicable

1c.7 **Consistency of Results across Studies** *(Summarize the consistency of the magnitude and direction of the effect):* Not applicable

1c.8 **Net Benefit** *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms):* Not applicable

1c.9 **Grading of Strength/Quality of the Body of Evidence.** Has the body of evidence been graded? No

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: Not applicable

1c.11 **System Used for Grading the Body of Evidence:** Other

See Guidance for Definitions of Rating Scale: H=High; M=Moderate; L=Low; I=Insufficient; NA=Not Applicable
### 1c.12 If other, identify and describe the grading scale with definitions:  
**Not applicable**

### 1c.13 Grade Assigned to the Body of Evidence:  
**Not applicable**

### 1c.14 Summary of Controversy/Contradictory Evidence:  
**Not applicable**

### 1c.15 Citations for Evidence other than Guidelines (*Guidelines addressed below)*:  
**Not applicable**

### 1c.16 Quote verbatim, the specific guideline recommendation (Including guideline # and/or page #):

</tr>
</tbody>
</table>

**Was the threshold criterion, *Importance to Measure and Report*, met?**

(1a & 1b must be rated moderate or high and 1c yes)  
- **Yes**  
- **No**

Provide rationale based on specific subcriteria:  
**For a new measure if the Committee votes NO, then STOP.**  
**For a measure undergoing endorsement maintenance, if the Committee votes NO because of 1b. (no opportunity for improvement), it may be considered for continued endorsement and all criteria need to be evaluated.**

---

### 2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)  
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

**S.1 Measure Web Page** *(In the future, NQF will require measure stewards to provide a URL link to a web page where current detailed specifications can be obtained.)* Do you have a web page where current detailed specifications for this measure can be obtained?  
**Yes**

**S.2 If yes, provide web page URL:** [http://qualityindicators.ahrq.gov/modules/psi_resources.aspx](http://qualityindicators.ahrq.gov/modules/psi_resources.aspx)

<table>
<thead>

</thead>
</table>
### 2a1. Precise Measure Specifications. *(The measure specifications precise and unambiguous.)*

#### 2a1.1 Numerator Statement *(Brief, narrative description of the measure focus or what is being measured about the target population, e.g., cases from the target population with the target process, condition, event, or outcome):*

Discharges among cases meeting the inclusion and exclusion rules for the denominator with ICD-9-CM code denoting accidental cut, puncture, perforation, or laceration during a procedure in any secondary diagnosis field.

#### 2a1.2 Numerator Time Window *(The time period in which the target process, condition, event, or outcome is eligible for inclusion):*

User may specify the time window; generally one calendar year.

#### 2a1.3 Numerator Details *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, codes with descriptors, and/or specific data collection items/responses:)*

ICD-9-CM Accidental puncture or laceration diagnosis codes:

- E8700 SURGICAL OPERATION
- E8701 INFUSION OR TRANSFUSION
- E8702 KIDNEY DIALYSIS OR OTHER PERFUSION
- E8703 INJECTION OR VACCINATION
- E8704 ENDOSCOPIC EXAMINATION
- E8705 ASPIRATION OF FLUID OR TISSUE, PUNCTURE, AND CATHETERIZATION
- E8706 HEART CATHETERIZATION
- E8707 ADMINISTRATION OF ENEMA
- E8708 OTHER SPECIFIED MEDICAL CARE
- E8709 UNSPECIFIED MEDICAL CARE
- 9982 ACCIDENTAL PUNCTURE OR LACERATION DURING A PROCEDURE

#### 2a1.4 Denominator Statement *(Brief, narrative description of the target population being measured):*

All surgical and medical discharges age 18 years and older defined by specific DRGs or MS-DRGs.

#### 2a1.5 Target Population Category *(Check all the populations for which the measure is specified and tested if any):* Adult/Elderly Care

#### 2a1.6 Denominator Time Window *(The time period in which cases are eligible for inclusion):*

User may specify the time window; generally one calendar year.

#### 2a1.7 Denominator Details *(All information required to identify and calculate the target population/denominator such as definitions, codes with descriptors, and/or specific data collection items/responses):*

See Patient Safety Indicators Appendices:

- Appendix B – Medical Discharge DRGs
- Appendix C – Medical Discharge MS-DRGs
- Appendix D – Surgical Discharge DRGs
- Appendix E – Surgical Discharge MS-DRGs

Link to PSI appendices:

See Guidance for Definitions of Rating Scale: H=High; M=Moderate; L=Low; I=Insufficient; NA=Not Applicable
2a1.8 Denominator Exclusions *(Brief narrative description of exclusions from the target population)*:
Exclude cases:
- with principal diagnosis denoting accidental cut, puncture, perforation, or laceration or secondary diagnosis present on admission
- MDC 14 (pregnancy, childbirth, and puerperium)
- with ICD-9-CM code for spine surgery
- with missing gender (SEX=missing), age (AGE=missing), quarter (DQTR=missing), year (YEAR=missing) or principal diagnosis (DX1=missing)

2a1.9 Denominator Exclusion Details *(All information required to identify and calculate exclusions from the denominator such as definitions, codes with descriptors, and/or specific data collection items/responses)*:
ICD-9-CM Spine surgery procedure codes:
0301
REMOVAL OF FOREIGN BODY FROM SPINAL CANAL
0302
REOPENING OF LAMINECTOMY SITE
0309
OTHER EXPLORATION AND DECOMPRESSION OF SPINAL CANAL

(Select type. Provide specifications for risk stratification in 2a.1.10 and for statistical model in 2a.1.13):

Statistical risk model

#### 2a.1.12 If "Other," please describe:

#### 2a.1.13 Statistical Risk Model and Variables

(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development should be addressed in 2b4.):

The predicted value for each case is computed using a hierarchical model (logistic regression with hospital random effect) and covariates for gender, age, modified CMS DRG, transfer status, procedure day availability, and the AHRQ Comorbidity category.

The reference population used in the regression is the universe of discharges for states that participate in the HCUP State Inpatient Data (SID) for the years 2008, a database consisting of 42 states and approximately 30 million adult discharges. The expected rate is computed as the sum of the predicted value for each case divided by the number of cases for the unit of analysis of interest (i.e., hospital). The risk adjusted rate is computed using indirect standardization as the observed rate divided by the expected rate, multiplied by the reference population rate.

Covariates used in this measures:

### 2a1.17-18. Type of Score: Rate/proportion

### 2a1.19 Interpretation of Score (Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score): Better quality = Lower score

### 2a1.20 Calculation Algorithm/Measure Logic (Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.):

Each indicator is expressed as a rate, is defined as outcome of interest / population at risk or numerator / denominator. The AHRQ Quality Indicators (AHRQ QI) software performs six steps to produce the rates. 1) Discharge-level data is used to mark inpatient records containing the outcome of interest and 2) the population at risk. For provider indicators, the population at risk is also derived from hospital discharge records; for area indicators, the population at risk is derived from U.S. Census data. 3) Calculate observed rates. Using output from steps 1 and 2, rates are calculated for user-specified combinations of stratifiers. 4) Calculate expected rates. Regression coefficients from a reference population database are applied to the discharge records and aggregated to the provider or area level. For indicators that are not risk-adjusted, this is the reference population rate. 5) Calculate risk-adjusted rate. Use the indirect standardization to account for case-mix. For indicators that are not risk-adjusted, this is the same as the observed rate. 6) Calculate smoothed rate. A Univariate shrinkage factor is applied to the risk-adjusted rates. The shrinkage estimate reflects a reliability adjustment unique to each indicator.

### 2a1.33 Level of Analysis

(Check the levels of analysis for which the measure is specified and tested):

- Facility

### 2a1.34-35 Care Setting

(Check all the settings for which the measure is specified and tested):

- Hospital/Acute Care Facility

### 2a2. Reliability Testing

(Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.)

#### 2a2.1 Data/Sample

(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

#### 2a2.2 Analytic Method

(Describe method of reliability testing & rationale):

The signal to noise ratio is the ratio of the between hospital variance (signal) to the within hospital variance (noise). The formula is \( \frac{\text{signal}}{\text{signal} + \text{noise}} \). The ratio itself is only a diagnostic for the degree of variance in the risk-adjusted rate systematically associated with the provider. Therefore, what matters is the magnitude of the variance in the “smoothed” rate (that is, the variance in the risk-adjusted rate after the application of the univariate shrinkage estimator based on the signal ratio).

#### 2a2.3 Testing Results

(Reliability statistics, assessment of adequacy in the context of norms for the test conducted):

What the data demonstrate is systematic variation in the provider level rate of 1.136 to 5.075 per 1,000 from the 5th to 95th percentile after a signal ratio of 0.818 is applied as the shrinkage estimator (that is, after accounting for variation due to random factors).

### 2b. VALIDITY

**Validity, Testing, including all Threats to Validity:**

- H = High
- M = Moderate
- L = Low
- I = Insufficient
- NA = Not Applicable

#### 2b1.1 Describe how the measure specifications (measure focus, target population, and exclusions) are consistent with the evidence cited in support of the measure focus (criterion 1c) and identify any differences from the evidence:

No identified differences

#### 2b2. Validity Testing

(Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)

#### 2b2.1 Data/Sample

(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

The first study (Kaafarani HMA, et al. Validity of selected Patient Safety Indicators: opportunities and concerns. J Am Coll Surg 2011; 212(6):924-34) examined the criterion validity, specifically the positive predictive value (PPV), of 12 selected PSIs using clinical data abstracted from the Veterans Health Administration (VA) electronic medical record (EMR) as the gold standard. The second study (Utter GH, et al. Positive predictive value of the AHRQ accidental puncture or laceration patient safety indicator. Ann Surg 2009; 250(6):1041-5) recruited hospitals for participation in the Validation Pilot Project through the AHRQ Quality Indicators (QI) technical support listserv and conducted web-based informational sessions to introduce the study and outline expectations of participants. Participation was voluntary and without compensation. We asked participants to commit to test the Accidental Puncture or Laceration indicator as well as four other PSIs included in Phase I of the Validation Pilot Project. The 47 participating hospitals from 29 states included a spectrum of different sizes, ownership types, and academic affiliations.

#### 2b2.2 Analytic Method

(Describe method of validity testing and rationale; if face validity, describe systematic assessment):
Calculation of the positive predictive value, which is defined as the percentage of reported events that are confirmed as true events based upon application of a “criterion (gold) standard.” Sensitivity is defined as the percentage of all eligible events (based upon the same criterion standard) that are reported by hospitals in the administrative data set used for validation. In the cited studies, the criterion standard was based on review of randomly sampled medical records by a trained nurse abstractor, using a standard data collection tool and guidelines, with secondary review of clinical details by an academic surgeon. Confidence intervals (95%) were estimated with adjustment for clustering of observations within hospitals, as appropriate.

A structured review of each indicator was undertaken to evaluate the face validity (from a clinical perspective) of the indicators. Specifically, the panels approach sought to establish consensual validity, which “extends face validity from one expert to a panel of experts who examine and rate the appropriateness of each item….” The methodology for the structured review was adapted from the RAND/UCLA Appropriateness Method and consisted of an initial independent assessment of each indicator by clinician panelists using an initial questionnaire, a conference call among all panelists, followed by a final independent assessment by clinician panelists using the same questionnaire. The panel process served to refine definitions of some indicators, add new measures, and dismiss indicators with major concerns from further consideration.

Twenty-one professional clinical organizations were invited to submit nominations. These organizations were selected based on the applicability of the specialty or subspecialty to our quality indicators. Organizations that represented general practitioners (e.g., general surgeons, internists, critical care physicians, perioperative nurses, and critical care nurses) were asked to nominate more panelists than those representing sub-specialties. Fifteen organizations submitted nominations: American Association of Critical-Care Nurses; American Academy of Family Physicians; American College of Cardiology; American College of Nurse-Midwives; American College of Obstetricians and Gynecologists; American College of Physicians/American Society of Internal Medicine; American College of Radiology; American College of Surgeons; American Geriatric Society; Association of Perioperative Nurses; American Society of Anesthesiologists; American Society of Health-system Pharmacists; American Thoracic Society; Association of Women’s Health Obstetric and Neonatal Nurses; and National Association of Inpatient Physicians.

These professional organizations nominated a total of 162 clinicians. Each nominee was invited to participate in the evaluation. In order to be eligible to participate, nominees were required to spend at least 30% of their work time on patient care, including hospitalized patients. Ninety-two nominees accepted this invitation. Five nominees were ineligible to participate. Nominees were asked to provide information regarding their practice characteristics, including specialty and subspeciality and setting (i.e., urban vs. rural location, region of country, and service to underserved populations), information regarding primary hospital of practice (i.e., funding source) and personal information (i.e., clinical education history, academic affiliation).

For assignments to each panel, a list of applicable specialties was identified for the indicators to be evaluated by a given panel. Panelists were selected so that each panel had diverse membership in terms of practice characteristics and setting. Thus, when a specific area was over-represented by the pool of eligible nominees, randomly drawn members from that specific sub-group were contacted first to fill the panels. In addition, conference call scheduling logistics influenced assignments. Fifty-seven of the eligible panelists accepted the invitation to participate on specific panels. Four did not participate in the conference call, and thus were removed from the panels. All other panelists (53) completed the evaluation in full.

Eight panels were formed. Complications of medical care indicators were examined by two panels. Surgical complications indicators were reviewed by three panels. Another panel assessed indicators related to procedural complications. Finally, two panels examined obstetric complications indicators. All panels had diversity in the geographic location of panelists, and the type of practice.

2b2.3 Testing Results (Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment):

The two studies estimated a nominal PPV—i.e., considering even minor complications that did not require repair as true events—of 85% (95% CI, 77-91%) and 91% (95% CI, 88-94%), respectively. The VA study (Kaafarani HMA et al.) assessed the interrater reliability between chart abstractors and reported an estimate of 97%. However, if such minor complications were classified as false positive cases, the estimated PPV of the indicator in the two studies decreased to 79% and 68%, respectively. A large proportion of all flagged cases (76%) in the second study involved some form of repair of the unintentionally damaged structure. A smaller percentage (4%) required a separate return to the operating room because the injury was not recognized during the initial procedure. Although precise proportions were difficult to estimate, many of the true-positive cases may not have been preventable because scar tissue or adhesions were associated with 25-40% of cases and because the goals of the operation in some cases (e.g., tumor-free margin of excision of a malignant lesion or emergency control of hemorrhage) may have warranted an increased risk of unintentional damage to other structures.

False positive rates were low in both of these studies. Some false positives were due to complications that were actually present on admission (i.e., 6 of 17 false positives in the VA study, 5 of 23 false positives in the AHRQ study), which would automatically be
excluded by users with “present on admission” (POA) data. Adjusting for the availability of POA data, estimated PPVs are 90% from the VA and 93% from the AHRQ study. The remaining false positives were either non-accidental injuries (e.g., deliberate disruption of tissue to achieve surgical goals) or injuries unrelated to a puncture or laceration (e.g., bleeding, dislodgement of a tube or device).

We have very limited evidence about the sensitivity of this indicator. Investigators in New York systematically searched their hospital administrative data for procedure codes suggesting repair of iatrogenic injuries, and reported that this PSI may have missed 27% of bladder injuries from hysterectomy, 21% of bowel injuries from cholecystectomy, 47% of abdominal injuries from lysis of adhesions, 54% of abdominal injuries from nephroureterectomy, and 20% of spinal injuries from lumbar surgery (Gallagher B, Cen L, Hannan EL. Validation of AHRQ’s Patient Safety Indicator for Accidental Puncture or Laceration. In: Henriksen K, Battles JB, Marks ES, Lewin DI, editors. Advances in Patient Safety: From Research to Implementation [Volume 2: Concepts and Methodology]. Rockville, MD: Agency for Healthcare Research and Quality; 2005). In a separate study, the authors (Romano PS, Schembri ME, Rainwater JA. Can administrative data be used to ascertain clinically significant postoperative complications? Am J Med Qual 2002;17:145-154) identified 19 of 45 chart-confirmed episodes of accidental puncture or laceration using discharge abstracts of disectomy patients at 30 California hospitals in 1990-91, with only one false positive. This latter study provided part of the justification for removing spine surgery from the denominator of PSI 15.

An alternative validation approach, based on the principle of construct validity, is to establish a correlation at the provider level between performance on this indicator and performance on an alternative measure of surgical care quality. In a study using an implicit process measure of quality (Miller MR, et al., Am J Med Qual 2005; 20:239-252), smoothed rates of this PSI among 2,116 hospitals surveyed by The Joint Commission were significantly (p=0.004) associated with summary evaluation scores, in the expected direction.

**POTENTIAL THREATS TO VALIDITY.** (All potential threats to validity were appropriately tested with adequate results.)

**2b3. Measure Exclusions.** (Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.)

**2b3.1 Data/sample for analysis of exclusions** (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

**2b3.2 Analytic Method** (Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference):

We conducted an analysis of each exclusion to determine whether the exclusion was still necessary given the availability of present on admission data. Only those exclusion that are "related to POA" were evaluated.

<table>

If the user’s data lacks present on admission information, then the likelihood that the outcome of interest and the covariates are present on admission is estimated using a Markov Chain Monte Carlo (MCMC) estimation procedure. That likelihood is then used to adjust the observed and expected rates.

**2b3.3 Results** (Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):

Based on the analysis, we have made the following recommendations for future revisions of this indicator:

No changes are recommended for PSI #15.

Exclusion 1 should be retained for reasons related to preventability.

Retain exclusion 2; the MDC 14 exclusions are not candidates to be dropped in this work.

**2b4. Risk Adjustment Strategy.** (For outcome measures, adjustment for differences in case mix (severity) across measured

See Guidance for Definitions of Rating Scale: H=High; M=Moderate; L=Low; I=Insufficient; NA=Not Applicable
## NQF #0345 Accidental Puncture or Laceration Rate (PSI 15)

**2b4.1 Data/Sample** (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

**2b4.2 Analytic Method** (Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables):

Risk-adjustment models use a standard set of categories based on readily available classification systems for demographics, severity of illness and comorbidities. Within each category, covariates are initially selected based on a minimum of 30 cases in the outcome of interest. Then a stepwise regression process on a development sample is used to select a parsimonious set of covariates where $p<.05$. Model is then tested on a validation sample.

If the user’s data lacks present on admission information, then the likelihood that the outcome of interest and the covariates are present on admission is estimated using a Markov Chain Monte Carlo (MCMC) estimation procedure. That likelihood is then used to adjust the observed and expected rates.

Specifically, the risk-adjustment model for PSI 15 includes female sex, three age categories, about 68 modified surgical DRG categories representing different types of procedures, 16 body system categories, transfer from another hospital, and comorbidities including peripheral vascular disease, diabetes with and without complications, renal failure, obesity, weight loss, blood loss, and deficiency anemia.

**2b4.3 Testing Results** (Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata):

C-statistic 0.892

**2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:** Not applicable

**2b5. Identification of Meaningful Differences in Performance.** (The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.)

**2b5.1 Data/Sample** (Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

**2b5.2 Analytic Method** (Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance):

Posterior probability distribution parameterized using the Gamma distribution

**2b5.3 Results** (Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance):

3a.2. Provide a rationale for why the measure performance results are meaningful, understandable, and useful for public reporting. If usefulness was demonstrated (e.g., focus group, cognitive testing), describe the data, method, and results: A research team from the School of Public Affairs, Baruch College, under contracts with the Department of Public Health, Weill Medical College and Battelle, Inc., has developed a pair of Hospital Quality Model Reports at the request of the Agency for Healthcare Research & Quality (AHRQ). These reports are designed specifically to report comparative information on hospital performance based on the AHRQ Quality Indicators (QIs). The work was done in close collaboration with AHRQ staff and the AHRQ Quality Indicators team.

The Model Reports (discussed immediately above) are based on:
• Extensive search and analysis of the literature on hospital quality measurement and reporting, as well as public reporting on health care quality more broadly;
• Interviews with quality measurement and reporting experts, purchasers, staff of purchasing coalitions, and executives of integrated health care delivery systems who are responsible for quality in their facilities;
• Two focus groups with chief medical officers of hospitals and/or systems and two focus groups with quality managers from a broad mix of hospitals;
• Four focus groups with members of the public who had recently experienced a hospital admission; and
• Four rounds of cognitive interviews (a total of 62 interviews) to test draft versions of the two Model Reports with members of the public with recent hospital experience, basic computer literacy but widely varying levels of education

3.2 Use for other Accountability Functions (payment, certification, accreditation). If used in a public accountability program,
The Patient Safety Indicators (PSIs) are a set of indicators providing information on potential in hospital complications and adverse events following surgeries, procedures, and childbirth. The PSIs were developed after a comprehensive literature review, analysis of ICD-9-CM codes, review by a clinician panel, implementation of risk adjustment, and empirical analyses.

The PSIs can be used to help hospitals identify potential adverse events that might need further study; provide the opportunity to assess the incidence of adverse events and in hospital complications using administrative data found in the typical discharge record; include indicators for complications occurring in hospital that may represent patient safety events; and, indicators also have area level analogs designed to detect patient safety events on a regional level.

http://qualityindicators.ahrq.gov/modules/psi_overview.aspx

The following are several entities that use the measure in quality improvement:

1) University Healthcare Consortium (UHC)
   UHC is an alliance of 103 academic medical centers and 219 of their affiliated hospitals. UHC reports this and other AHRQ QIs to their member hospitals for their internal quality improvement purposes.

2) Minnesota Hospital Association

3) Ministry
   Ministry is a 14 hospital system in WI, which includes the Marshfield Clinic in its system.

4) Premier
   Premier uses the measure in their "QUEST" tool, which is used by hundreds of hospitals in their quality assurance and improvement work.

3b.2. Provide rationale for why the measure performance results are meaningful, understandable, and useful for quality improvement. If usefulness was demonstrated (e.g., QI initiative), describe the data, method and results:

The AHRQ QI support line receives approximately 150 user queries per month and almost 50 user per month download the AHRQ QI PSI software. Users have used the PSI since the release in 2003.

Users can readily use the risk-adjusted rate and the observed to expected results to identify opportunities for improvement for specific patient populations based on default stratifiers or risk adjustment model covariates. In addition, comparative data from the AHRQ SID and NIS databases provides relative performance information.

Overall, to what extent was the criterion, Usability, met? H M L I

Provide rationale based on specific subcriteria:

4. FEASIBILITY

Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. (evaluation criteria)

4a. Data Generated as a Byproduct of Care Processes: H M L I

4a.1-2 How are the data elements needed to compute measure scores generated? (Check all that apply).

Data used in the measure are:
   Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims)
### 4b. Electronic Sources

**4b.1** Are the data elements needed for the measure as specified available electronically (Elements that are needed to compute measure scores are in defined, computer-readable fields): ALL data elements in electronic claims

**4b.2** If ALL data elements are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources:

### 4c. Susceptibility to Inaccuracies, Errors, or Unintended Consequences

**4c.1** Identify susceptibility to inaccuracies, errors, or unintended consequences of the measurement identified during testing and/or operational use and strategies to prevent, minimize, or detect. If audited, provide results:

Coding professionals follow detail guidelines, are subject to training and credentialing requirements, peer review and audit.

### 4d. Data Collection Strategy/Implementation

**A.2** Please check if either of the following apply (regarding proprietary measures):

**4d.1** Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues (e.g., fees for use of proprietary measures):

The AHRQ QI software has been publicly available at no cost since 2001; Users have over ten years of experience using the AHRQ QI software in SAS and Windows.

Overall, to what extent was the criterion, Feasibility, met? Provide rationale based on specific subcriteria:

### OVERALL SUITABILITY FOR ENDORSEMENT

**Does the measure meet all the NQF criteria for endorsement?** Yes ☐ No ☑

**Rationale:**

If the Committee votes No, STOP.
If the Committee votes Yes, the final recommendation is contingent on comparison to related and competing measures.

### 5. COMPARISON TO RELATED AND COMPETING MEASURES

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure before a final recommendation is made.

#### 5.1 If there are related measures (either same measure focus or target population) or competing measures (both the same measure focus and same target population), list the NQF # and title of all related and/or competing measures:

### 5a. Harmonization

**5a.1** If this measure has EITHER the same measure focus OR the same target population as NQF-endorsed measure(s): Are the measure specifications completely harmonized?

**5a.2** If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden:

### 5b. Competing Measure(s)

**5b.1** If this measure has both the same measure focus and the same target population as NQF-endorsed measure(s): Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible):
CONTACT INFORMATION

Co.1 Measure Steward (Intellectual Property Owner): Agency for Healthcare Research and Quality, 540 Gaither Road, Rockville, Maryland, 20850

Co.2 Point of Contact: John, Bott, Contractor, AHRQ Quality Indicators Measure Expert Center for Delivery, Organization and Markets, John.Bott@ahrq.hhs.gov, 301-427-1317-

Co.3 Measure Developer if different from Measure Steward: Agency for Healthcare Research and Quality, 540 Gaither Road, Rockville, Maryland, 20850

Co.4 Point of Contact: John, Bott, Contractor, AHRQ Quality Indicators Measure Expert Center for Delivery, Organization and Markets, John.Bott@ahrq.hhs.gov, 301-427-1317-

Co.5 Submitter: John, Bott, Contractor, AHRQ Quality Indicators Measure Expert Center for Delivery, Organization and Markets, John.Bott@ahrq.hhs.gov, 301-427-1317-, Agency for Healthcare Research and Quality

Co.6 Additional organizations that sponsored/participated in measure development:
University of California-Davis
Stanford University
Battelle Memorial Institute

Co.7 Public Contact: John, Bott, Contractor, AHRQ Quality Indicators Measure Expert Center for Delivery, Organization and Markets, John.Bott@ahrq.hhs.gov, 301-427-1317-, Agency for Healthcare Research and Quality

ADDITIONAL INFORMATION

Workgroup/Expert Panel involved in measure development
Ad.1 Provide a list of sponsoring organizations and workgroup/panel members’ names and organizations. Describe the members’ role in measure development.
Multi-specialty Panel and Surgical Panel members are listed in the technical report:
http://qualityindicators.ahrq.gov/Downloads/Modules_Non_Software/Modules%20Development%20Bullet/psi_development.zip

Ad.2 If adapted, provide title of original measure, NQF # if endorsed, and measure steward. Briefly describe the reasons for adapting the original measure and any work with the original measure steward: This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP “sentinel events”)

Measure Developer/Steward Updates and Ongoing Maintenance
Ad.3 Year the measure was first released: 2003
Ad.4 Month and Year of most recent revision: 08, 2011
Ad.5 What is your frequency for review/update of this measure? Annual
Ad.6 When is the next scheduled review/update for this measure? 12, 2011

Ad.7 Copyright statement: Not applicable
Ad.8 Disclaimers: Not applicable
Ad.9 Additional Information/Comments: Not applicable

Date of Submission (MM/DD/YY): 09/14/2011
