### BRIEF MEASURE INFORMATION

| De.1 Measure Title: | Hemodialysis Vascular Access- Maximizing Placement of Arterial Venous Fistula (AVF) |
| Co.1.1 Measure Steward: | Centers for Medicare & Medicaid Services |
| De.2 Brief Description of Measure: | Percentage of patients on maintenance hemodialysis during the last HD treatment of month using an autogenous AV fistula with two needles |
| 2a1.1 Numerator Statement: | Patients who were on maintenance hemodialysis (HD) using an autogenous AV fistula with two needles at the last HD treatment of month |
| 2a1.4 Denominator Statement: | Patients on maintenance hemodialysis during the last HD treatment of month including patients on home hemodialysis |
| 2a1.8 Denominator Exclusions: | Patients on acute hemodialysis, peritoneal dialysis, or patients <18 years of age |
| 1.1 Measure Type: | Process |
| 2a1.25-26 Data Source: | Administrative claims, Electronic Clinical Data |
| 2a1.33 Level of Analysis: | Facility |

| 1.2-1.4 Is this measure paired with another measure? | No |

| De.3 If included in a composite, please identify the composite measure (title and NQF number if endorsed): | 0256: Vascular Access Clinical Performance Measure II: Minimizing Use of Catheters as Chronic Dialysis Access |

### STAFF NOTES (issues or questions regarding any criteria)

Comments on Conditions for Consideration:

| Is the measure untested? | Yes [ ] No [ ] |
| If untested, explain how it meets criteria for consideration for time-limited endorsement: |

1a. Specific national health goal/priority identified by DHHS or NPP addressed by the measure (check De.5): |
5. Similar/related endorsed or submitted measures (check 5.1): |

Other Criteria:

| Staff Reviewer Name(s): |

### 1. IMPACT, OPPORTUNITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence. Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)
1a. High Impact:  
(End Stage Renal Disease (ESRD) 

1a.1 Demonstrated High Impact Aspect of Healthcare: Affects large numbers, A leading cause of morbidity/mortality

1a.2 If “Other,” please describe:

1a.3 Summary of Evidence of High Impact (Provide epidemiologic or resource use data):

Numerous studies demonstrate that the use of AV fistulas have the best 5-year patency rates and require the fewest interventions compared with other access types. A study using data from the USRDS showed that patients receiving dialysis through catheters or AV grafts have greater mortality risk than patients dialyzed with fistula. Furthermore, infection-related deaths were significantly higher for catheters as compared to fistulas, in both diabetic and non-diabetic ESRD patients. Finally, the advantages of AV fistula over other accesses are clearly delineated in the NKF K/DOQI guidelines, summarized as follows: 1) AV fistulas have the lowest rate of thrombosis and require the fewest interventions, 2) cost of AV fistula use and maintenance is the lowest, 3) fistulas have the lowest rates of infection, and 4) Fistulas are associated with the highest survival and lowest hospitalization rates. Indeed, a number of epidemiologic studies consistently demonstrate the reduced morbidity and mortality associated with greater use of AV fistulas for vascular access in maintenance hemodialysis.

1a.4 Citations for Evidence of High Impact cited in 1a.3:

1b. Opportunity for Improvement:  

1b.1 Briefly explain the benefits (improvements in quality) envisioned by use of this measure:

As mentioned above the NKF K/DOQI guidelines state the following: 1) AV fistulas have the lowest rate of thrombosis and require the fewest interventions, 2) cost of AV fistula use and maintenance is the lowest, 3) fistulas have the lowest rates of infection, and 4) Fistulas are associated with the highest survival and lowest hospitalization rates. Indeed, a number of epidemiologic studies consistently demonstrate the reduced morbidity and mortality associated with greater use of AV fistulas for vascular access in maintenance hemodialysis.

1b.2 Summary of Data Demonstrating Performance Gap (Variation or overall less than optimal performance across providers):
[For Maintenance – Descriptive statistics for performance results for this measure - distribution of scores for measured entities by quartile/decile, mean, median, SD, min, max, etc.]
Analysis of CROWNWeb data from January 2010 indicated the mean percentage of patients with AV Fistula was 45% (SD=14%). Distribution: Min=0%, Max=100%, 1st quartile=38%, median=46%, 3rd quartile=54%. These results indicate that on average, less than half of patients at facilities are dialyzing with AV Fistulas.

1b.3 Citations for Data on Performance Gap: [For Maintenance – Description of the data or sample for measure results reported in 1b.2 including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included]
Performance gap analyses were performed using CROWNWeb data from January 2010. There were 3,436 facilities and a total of 293,694 patients in this reporting month. Mean number of patients per facility was 84 (SD=52).

1b.4 Summary of Data on Disparities by Population Group: [For Maintenance – Descriptive statistics for performance results for this measure by population group]
For each population group analysis, the percent of patients (e.g. percent of females) was divided into quintiles and the performance measure was calculated for each quintile. The range in percent of patients with monthly AV Fistula measurements across quintiles is presented below. The test for trend for these disparities in performance were statistically significant but the ranges are small for race, sex, ethnicity, or age.
Population Group (Range):
Females (43.5%-48.5%)
Black (42.7%-49.0%)
White (43.2%-49.0%)
Asian (46.1%-48.6%)
Native American (45.6%-49.6%)
Hispanic (45.1%-48.5%)
Age (45.2%-48.2%)

1b.5 Citations for Data on Disparities Cited in 1b.4: [For Maintenance – Description of the data or sample for measure results reported in 1b.4 including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included]
CROWNWeb data from July 2009-December 2009 were analyzed. The number of facilities ranged from 3398-3453 and the total number of patients per month ranged from 263,743 - 290,713.

1c. Evidence (Measure focus is a health outcome OR meets the criteria for quantity, quality, consistency of the body of evidence.)
Is the measure focus a health outcome? Yes [ ] No [ ] If not a health outcome, rate the body of evidence:
Quantity: H [ ] M [ ] L [ ] I [ ]
Quality: H [ ] M [ ] L [ ] I [ ]
Consistency: H [ ] M [ ] L [ ] I [ ]

Does the measure pass subcriterion 1c?
M-H [ ] L [ ]
M [ ] M-H [ ] L [ ]
M-H [ ] L [ ]
M-H [ ] L [ ]

Health outcome – rationale supports relationship to at least one healthcare structure, process, intervention, or service
Does the measure pass subcriterion 1c?
Yes [ ]
No [ ]

1c.1 Structure-Process-Outcome Relationship (Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process-health outcome; intermediate clinical outcome-health outcome):
The measure focus is the process of measuring AV Fistula use at facilities. This process leads to improvement in mortality as follows:
Measure AV Fistula Rate--> Assess value-->Identify problems-->Increase Fistula Rate-->Impact on mortality.

1c.2-3 Type of Evidence (Check all that apply):
Clinical Practice Guideline, Selected individual studies (rather than entire body of evidence)

1c.4 Directness of Evidence to the Specified Measure (State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population):
The body of evidence shows a relationship between high AV Fistula rate and improved mortality and morbidity. This measure focus is on the measuring AV Fistula use in ESRD patients on HD.

1c.5 Quantity of Studies in the Body of Evidence (Total number of studies, not articles): 41

1c.6 Quality of Body of Evidence (Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events): A large body of literature exists showing strong associations between central venous catheter use in hemodialysis patients with poorer survival and greater morbidity [1-40, 44]. The prevalence of numerous patient comorbidity indicators was similar in facilities with high versus low...
Lower mortality has been observed with reduction in catheter use and an increase in fistula use in facility- and patient-level access use studies [7, 10, 13, 40, 41]. Furthermore, much of the 30-40% higher case-mix adjusted mortality rate for US hemodialysis patients compared to those in several European countries appears to be explained by differences in vascular access use between these two regions [2]. In addition, per person per year “access event” costs were greatest for patients with a catheter or arteriovenous graft, at $5,960 and $7,451, respectively, in 2007 as indicated in the 2009 USRDS Annual Report. In contrast, among patients with an arteriovenous fistula these costs averaged $3,194 — 57 percent lower than the costs incurred by patients with an AV graft [42].

The overall quality of the body of evidence for this measure has not been evaluated. Furthermore, the quality of the individual studies referenced in 1c.15 has not been graded.

1c.7 Consistency of Results across Studies  
(Summarize the consistency of the magnitude and direction of the effect): Results were consistent across all studies listed in body of evidence. For example, across 8 large observational studies of prevalent hemodialysis patients, the hazard ratio of case-mix adjusted all-cause mortality ranged from 1.32 to 1.75 (median HR~1.5, p<0.05 in all studies) for patients dialyzing with a catheter versus a native arteriovenous (AV) fistula [1-4, 8, 23, 26, 37, 44]. Catheter use in incident patients at the time of commencing hemodialysis was associated with a 1.5-2.5 fold higher HR of mortality. Furthermore, a 20% higher mortality rate was observed for every 20% greater facility percent catheter use (compared with AV fistula use[2]); conversion from a catheter to an AV access was associated with a 31% lower mortality rate whereas conversion from an AV access to a catheter was associated with a 80-138% higher mortality rate, in incident and prevalent patients respectively [7,10,13]. Native AV fistula use has also shown to be associated with longer survival in comparison to AV graft use. Case-mix adjusted mortality rates were 39% higher in 2 large cohort studies of incident patients initiating HD with an AV graft versus an AV fistula [3,44]. In three large cohort studies of HD patients dialyzing with an AV graft displayed a 5-20% higher mortality rate compared with patients dialyzing with an AV fistula, while in a fourth such study, patients dialyzing with AV graft versus an AV fistula displayed an 8% higher mortality rate among non-diabetic HD patients and a 41% higher mortality rate among diabetic HD patients. Furthermore, in a facility practice-based analysis, a 9% higher mortality rate was observed for every 20% greater facility percent AV graft use (compared with AV fistula use[2]). In addition, the number of access events is 3- to 7-fold greater in prosthetic grafts than in native AV fistulae and is an important factor in the higher annual access event costs observed for AV grafts compared with AV fistulae [43].

1c.8 Net Benefit  
(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms): Recent studies have shown a nearly 20% higher hazard of mortality for every 20% higher facility % catheter use [2]. Thus reducing catheter use and increase fistula use in facilities could lead to reduced mortality rates.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? No

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias:

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: The body of evidence was not graded.

1c.13 Grade Assigned to the Body of Evidence: An overall grade was not assigned.

1c.14 Summary of Controversy/Contradictory Evidence: No controversial or contradictory evidence was found.

1c.15 Citations for Evidence other than Guidelines(Guidelines addressed below):

30) Sands, J.J., Increasing AV fistulae and decreasing dialysis catheters: two aspects of improving patient outcomes. Blood Purif,
1c.16 Quote verbatim, the specific guideline recommendation (Including guideline # and/or page #):
The percent of all chronic hemodialysis patients who are dialyzed with an arteriovenous (AV) fistula (defined as the access in use with two needles) during their last hemodialysis treatment of the study period (Evidence Level B) National Kidney Foundation Kidney Disease Outcomes Quality Initiative (KDOQI) Guideline: KDOQI Vascular Access Guideline 8.1.2.1 (Evidence Level B): Prevalent functional AVF placement rate of greater than 65% of patients.

1c.18 National Guideline Clearinghouse or other URL:
http://www.kidney.org/Professionals/kdoqi/guideline_upHD_PD_VA/index.htm

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: KDOQI members. No information on representation of disclosures regrading bias.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: The rating system defined in the KDOQI Guidelines was used to grade the strength of the Guideline recommendation. KDOQI defined grades as follows:

Grade A: It is strongly recommended that clinicians routinely follow the guideline for eligible patients. There is strong evidence that the practice improves health outcomes.

Grade B: It is recommended that clinicians routinely follow the guideline for eligible patients. There is moderately strong evidence that the practice improves health outcomes.

Grade CPR: It is recommended that clinicians consider following the guideline for eligible patients. This recommendation is based...
on either weak evidence or on the opinions of the Work Group and reviewers that the practice might improve health outcomes.

1c.23 Grade Assigned to the Recommendation: KDOQI Guideline 8.1.2.1 was graded B.

1c.24 Rationale for Using this Guideline Over Others: No other guidelines available.

Based on the NQF descriptions for rating the evidence, what was the developer’s assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High  1c.26 Quality: High  1c.27 Consistency: High

Was the threshold criterion, Importance to Measure and Report, met? (1a & 1b must be rated moderate or high and 1c yes) Yes ☑️ No ☐

Provide rationale based on specific subcriteria:

For a new measure if the Committee votes NO, then STOP. For a measure undergoing endorsement maintenance, if the Committee votes NO because of 1b. (no opportunity for improvement), it may be considered for continued endorsement and all criteria need to be evaluated.

---

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)

Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

S.1 Measure Web Page (In the future, NQF will require measure stewards to provide a URL link to a web page where current detailed specifications can be obtained). Do you have a web page where current detailed specifications for this measure can be obtained? Yes

S.2 If yes, provide web page URL: http://www.arborresearch.org/ESRD_QMS.aspx

2a. RELIABILITY. Precise Specifications and Reliability Testing: H ☑️ M ☐ L ☐ I ☐

2a1. Precise Measure Specifications. (The measure specifications precise and unambiguous.)

2a1.1 Numerator Statement (Brief, narrative description of the measure focus or what is being measured about the target population, e.g., cases from the target population with the target process, condition, event, or outcome):

Patients who were on maintenance hemodialysis (HD) using an autogenous AV fistula with two needles at the last HD treatment of month.

2a1.2 Numerator Time Window (The time period in which the target process, condition, event, or outcome is eligible for inclusion):

For the ESRD CPM, we propose a one month time period. However, if the measure is adapted by other organizations for other purposes, there is no technical problem with using longer evaluation periods.

2a1.3 Numerator Details (All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, codes with descriptors, and/or specific data collection items/responses:

The numerator will be determined by counting the patients in the denominator for whom “Access Type for Dialysis” = “autogenous AV fistula with two needles” at the last treatment of the month.

2a1.4 Denominator Statement (Brief, narrative description of the target population being measured):

Patients on maintenance hemodialysis during the last HD treatment of month including patients on home hemodialysis

2a1.5 Target Population Category (Check all the populations for which the measure is specified and tested if any): Adult/Elderly Care

2a1.6 Denominator Time Window (The time period in which cases are eligible for inclusion):

One Month. However, facilities implementing this measure may choose any time period.

Calculation of the numerator and denominator is described below.
The patient’s age will be determined by subtracting the patient’s date of birth from the first day of the reporting month.

Hemodialysis patients are defined as follows: "Admit Date" to the specified facility is prior or equal to the first day of the study period, AND the patient has not been discharged ("Discharge Date" is null or blank), OR "Discharge Date" from the facility is greater than or equal to the last day of the study period AND “Treatment Dialysis Broad Start Date” is prior or equal to the first day of the study period, AND "Dialysis Broad Type of Treatment" = ‘HD’, AND “Primary Dialysis Setting” = 'Dialysis Facility/Center' or ‘Home’ on the last day of the study period, AND “Date Regular Chronic Dialysis Began” is prior to the first day of the study period. The denominator will include all patients at least 18 years old who are determined to be in-center hemodialysis or home hemodialysis patients. The denominator will include all patients greater than or equal to 18 years old who are determined to be in-center hemodialysis, or home hemodialysis patients.

The numerator will be determined by counting the patients in the denominator for whom “Access Type for Dialysis” = “autogenous AV fistula with two needles” at the last treatment of the month.

2a1.24 Sampling (Survey) Methodology. If measure is based on a sample (or survey), provide instructions for obtaining the sample, conducting the survey and guidance on minimum sample size (response rate):
N/A

2a1.25 Data Source (Check all the sources for which the measure is specified and tested). If other, please describe:
Administrative claims, Electronic Clinical Data

2a1.26 Data Source/Data Collection Instrument (Identify the specific data source/data collection instrument, e.g. name of database, clinical registry, collection instrument, etc.): This measure is primarily designed for collection in CROWNWeb but can also be calculated from Fistula First and Medicare claims data.

2a1.27-29 Data Source/data Collection Instrument Reference Web Page URL or Attachment: URL
http://www.projectcrownweb.org/crown/index.php

2a1.30-32 Data Dictionary/Code Table Web Page URL or Attachment: URL

2a1.33 Level of Analysis (Check the levels of analysis for which the measure is specified and tested): Facility

2a1.34-35 Care Setting (Check all the settings for which the measure is specified and tested): Dialysis Facility

2a2. Reliability Testing. (Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.)

2a2.1 Data/Sample (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
CROWNWeb data from July 2009-December 2009 were analyzed. The number of facilities ranged from 3415-3453. The total number of patients per month ranged from 263,743 - 290,713.

2a2.2 Analytic Method (Describe method of reliability testing & rationale):
Reliability was assessed by calculating facility-level month-to-month correlations. Pearson correlation coefficients were calculated between the current performance month and previous month for reporting months August 2009 through October 2010.

In Response to Question:
What is the rationale for considering correlation of facility scores in two time periods as a demonstration of reliability of the data? NQF is asking for evidence of the reliability of either: 1) the data used in the measure (e.g., lab date, lab method, dialysis dose) or 2) the measure score (amount of variation due to true differences among providers vs. error/noise – signal-to-noise analysis). With the data available from CROWNWeb, is it possible to conduct signal-to-noise analysis?

The use of correlation across different time periods is a measure of reliability that applies to any type of measure (based on normal or binary data, for example) and we find it useful from this perspective. In the case of a mixed normal model with between and within variances, $sb2$ and $sw2$ respectively, it can be seen that this correlation would estimate the same quantity as $1 - 1/F$ in the one way analysis of variance applied to a single wave. That is, it would estimate $n \cdot sb2 / [ sw2 + n \cdot sb2]$ where $n$ is essentially an average facility size. So, it is again measuring the relative size of the between and within variation.

The NQF document “Guidance for Measure Testing and Evaluating Scientific Acceptability of Measure Properties” from January 2011 suggests using ANOVA to perform a signal-to-noise analysis. ANOVA was performed on patient level data from October 2010 using each measure as the independent variable and facility as the dependent variable. The intraclass correlation coefficients ranged from 0.02 to 0.34, the interunit reliability ranged from 0.57 to 0.97, and all measures had statistically significant F tests. Please see the attached document "ANOVASignaltoNoiseResults.pdf" for specific measure results.

For Maximizing Use of AV Fistula (AVF) the intraclass correlation was 0.07, the interunit reliability was 0.84, and the p-value for the F test was <0.0001.

2a2.3 Testing Results (Reliability statistics, assessment of adequacy in the context of norms for the test conducted):
Reliability of this measure has improved over time. Correlation coefficients ranged from 0.80 to 0.93. The lowest correlation was observed in the first two reporting months. In 2010, correlations from month-to-month were high (range: 0.82-0.92), thus indicating the data elements for this measure are reliable.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H M L I

2b1.1 Describe how the measure specifications (measure focus, target population, and exclusions) are consistent with the evidence cited in support of the measure focus (criterion 1c) and identify any differences from the evidence:
The target population in the validity analysis was all ESRD patients on HD who are reported in CROWNWeb in 2009. The population and results from the validity analyses performed were consistent with the evidence provided. The validity analyses showed that relative to facilities with the highest performance scores, the Standardized Mortality Ratio (SMR) increased as performance scores decreased.

2b2. Validity Testing. (Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)

2b2.1 Data/Sample (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
2009 CROWNWeb data (July - December) were used to calculate monthly performance scores, and the SMR was calculated using 2009 Medicare-paid dialysis claims and the Medical Evidence Form (Form CMS-2728).

2b2.2 Analytic Method (Describe method of validity testing and rationale; if face validity, describe systematic assessment):
Validity was assessed using Poisson regression models to measure the association between facility level quintiles of performance scores and the 2009 SMR (methodology on SMR calculations is attached). Facility-level performance scores were divided into quintiles and the relative risk (RR) of mortality was calculated for each quintile. The highest quintile was used as the reference group. Thus, a RR>1.0 for the lower performance score quintiles would indicate a higher relative risk of mortality.

2b2.3 Testing Results (Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment):
Quintiles of the performance scores were defined as follows:
Q1:0-<37%
Q2:37%-<44%
Q3:44%-<50%
Q4:50%-<57%
Q5:57%-100%
Results from the Poisson model indicated lower performance scores were significantly associated with SMR (p<0.0001). Relative risk of mortality was highest in the lowest performance measure quintile (RR=1.18;95% CI: 1.14,1.22). For quintiles 2, RR=1.15 (95% CI:1.11,1.19), quintile 3, RR=1.11 (95% CI:1.07-1.15) and was 1.08 for quintile 4 (95% CI:1.05,1.12). These findings confirm the association between AV fistula use and improved mortality.

POTENTIAL THREATS TO VALIDITY. (All potential threats to validity were appropriately tested with adequate results.)

2b3. Measure Exclusions. (Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.)

2b3.1 Data/Sample for analysis of exclusions (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
CROWNWeb data from July through December 2009 included up to 3495 facilities per month with an average of 80 patients per facility. The total number of patients per month ranged from 267,515 - 290,713. The number of exclusions per month ranged from 1,732 to 2,322. This measure was intended for adult hemodialysis patients; therefore, no further exclusions were made.

2b3.2 Analytic Method (Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference):
Not applicable

2b3.3 Results (Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):
Not applicable

2b4. Risk Adjustment Strategy. (For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.)

2b4.1 Data/Sample (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
No risk adjustment is performed for this measure.

2b4.2 Analytic Method (Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables):
Not applicable

2b4.3 Testing Results (Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata):
Not applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment: Disparities by population group were not observed (see results in Section 1b.4). Furthermore, there is no evidence suggesting this measure should be risk adjusted.

2b5. Identification of Meaningful Differences in Performance. (The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.)

2b5.1 Data/Sample (Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
Analyses were performed using CROWNWeb data from January 2010. There were 3436 facilities and a total of 293,694 patients in this reporting month. Mean number of patients per facility was 84 (SD=52).

2b5.2 Analytic Method (Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance):
Facility-level percents of patients with AV fistula measured were calculated as the number of patients within the facility with AV...
fistula reported divided by the total number of HD patients in the facility. The mean, SD, and quartiles also were calculated.

2b5.3 Results (Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance):

Analysis of CROWNWeb data from January 2010 indicated the mean percentage of patients with AV Fistula was 45% (SD=14%). Distribution: Min=0%, Max=100%, 1st quartile=38%, median=46%, 3rd quartile=54%. These results indicate that on average, less than half of patients at facilities are dialyzing with AV Fistulas.

2b6. Comparability of Multiple Data Sources/Methods. (If specified for more than one data source, the various approaches result in comparable scores.)

2b6.1 Data/Sample (Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):
Multiple data sources were not used.

2b6.2 Analytic Method (Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure):
Not applicable.

2b6.3 Testing Results (Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted):
Not applicable.

2c. Disparities in Care: □ □ □ □ □ (If applicable, the measure specifications allow identification of disparities.)

2c.1 If measure is stratified for disparities, provide stratified results (Scores by stratified categories/cohorts): This measure is not stratified.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:
No disparities have been identified.

2.1-2.3 Supplemental Testing Methodology Information:
Attachment ANOVASignaltoNoiseResults.pdf

Steering Committee: Overall, was the criterion, Scientific Acceptability of Measure Properties, met? (Reliability and Validity must be rated moderate or high) Yes□ No□
Provide rationale based on specific subcriteria:
If the Committee votes No, STOP

3. USABILITY

Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (evaluation criteria)

C.1 Intended Purpose/ Use (Check all the purposes and/or uses for which the measure is intended): Public Reporting, Quality Improvement (Internal to the specific organization), Quality Improvement with Benchmarking (external benchmarking to multiple organizations)

3.1 Current Use (Check all that apply; for any that are checked, provide the specific program information in the following questions): Public Reporting, Quality Improvement (Internal to the specific organization)

3a. Usefulness for Public Reporting: □ □ □ □ □
(The measure is meaningful, understandable and useful for public reporting.)
3a. Use in Public Reporting - disclosure of performance results to the public at large (If used in a public reporting program, provide name of program(s), locations, Web page URL(s)). If not publicly reported in a national or community program, state the reason AND plans to achieve public reporting, potential reporting programs or commitments, and timeline, e.g., within 3 years of endorsement: [For Maintenance – If not publicly reported, describe progress made toward achieving disclosure of performance results to the public at large and expected date for public reporting; provide rationale why continued endorsement should be considered.]

Quality measure results will be evaluated for future public reporting on Medicare’s Dialysis Facility Compare website.

3a.2. Provide a rationale for why the measure performance results are meaningful, understandable, and useful for public reporting. If usefulness was demonstrated (e.g., focus group, cognitive testing), describe the data, method, and results: This measure has been reported in previous ESRD CPM Annual Reports. Healthcare providers and patients can easily understand the meaning of this measure.

3.2 Use for other Accountability Functions (payment, certification, accreditation). If used in a public accountability program, provide name of program(s), locations, Web page URL(s): This measure is not used for other Accountability Functions.

3b. Usefulness for Quality Improvement: H M L I

(The measure is meaningful, understandable and useful for quality improvement.)

3b.1. Use in QI. If used in quality improvement program, provide name of program(s), locations, Web page URL(s): [For Maintenance – If not used for QI, indicate the reasons and describe progress toward using performance results for improvement].

This measure is not currently used in a quality improvement program. However, in previous years, this measure was reported in ESRD CPM Annual Reports. The ESRD CPM Project was a national effort designed to assist dialysis providers to improve patient care and outcomes.

3b.2. Provide rationale for why the measure performance results are meaningful, understandable, and useful for quality improvement. If usefulness was demonstrated (e.g., QI initiative), describe the data, method and results: See response in 3a.2.

Overall, to what extent was the criterion, Usability, met? H M L I

Provide rationale based on specific subcriteria:

4. FEASIBILITY

Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. (evaluation criteria)

4a. Data Generated as a Byproduct of Care Processes: H M L I

4a.1-2 How are the data elements needed to compute measure scores generated? (Check all that apply).

Data used in the measure are: generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry)

4b. Electronic Sources: H M L I

4b.1 Are the data elements needed for the measure as specified available electronically (Elements that are needed to compute measure scores are in defined, computer-readable fields): ALL data elements in electronic health records (EHRs)

4b.2 If ALL data elements are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources:

4c. Susceptibility to Inaccuracies, Errors, or Unintended Consequences: H M L I
4c.1 Identify susceptibility to inaccuracies, errors, or unintended consequences of the measurement identified during testing and/or operational use and strategies to prevent, minimize, or detect. If audited, provide results. There are no potential barriers to retrieving data necessary for the measure, and there are no data availability issues.

4d. Data Collection Strategy/Implementation: H M L I

A.2 Please check if either of the following apply (regarding proprietary measures):

4d.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues (e.g., fees for use of proprietary measures):

Since this measure has been collected for several years as part of the CPM project, facilities are familiar with the data required for this measure, and data are readily available. It is unlikely that data elements will be susceptible to inaccuracies, errors, or unintended consequences.

Overall, to what extent was the criterion, Feasibility, met? H M L I

Provide rationale based on specific subcriteria:

OVERALL SUITABILITY FOR ENDORSEMENT

Does the measure meet all the NQF criteria for endorsement? Yes No

Rationale:

If the Committee votes No, STOP.
If the Committee votes Yes, the final recommendation is contingent on comparison to related and competing measures.

5. COMPARISON TO RELATED AND COMPETING MEASURES

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure before a final recommendation is made.

5.1 If there are related measures (either same measure focus or target population) or competing measures (both the same measure focus and same target population), list the NQF # and title of all related and/or competing measures:

0251 : Vascular Access—Functional Arteriovenous Fistula (AVF) or AV Graft or Evaluation by Vascular Surgeon for Placement
0256 : Hemodialysis Vascular Access—Minimizing use of catheters as Chronic Dialysis Access

5a. Harmonization

5a.1 If this measure has EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):

Are the measure specifications completely harmonized?

5a.2 If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden:

5b. Competing Measure(s)

5b.1 If this measure has both the same measure focus and the same target population as NQF-endorsed measure(s):

Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible):

ADDITIONAL INFORMATION

Workgroup/Expert Panel involved in measure development
Ad.1 Provide a list of sponsoring organizations and workgroup/panel members' names and organizations. Describe the members' role in measure development.
Clinical and data technical expert panels (TEP) were held in September and October 2006, respectively. Since 2006, no TEPs have been held for adult hemodialysis adequacy measures.

Ad.2 If adapted, provide title of original measure, NQF # if endorsed, and measure steward. Briefly describe the reasons for adapting the original measure and any work with the original measure steward: No changes to this measure title are requested.

Measure Developer/Steward Updates and Ongoing Maintenance
Ad.3 Year the measure was first released: 2007
Ad.4 Month and Year of most recent revision: 11, 2007
Ad.5 What is your frequency for review/update of this measure? Every 3 years
Ad.6 When is the next scheduled review/update for this measure? 06, 2013

Ad.7 Copyright statement:

Ad.8 Disclaimers:

Ad.9 Additional Information/Comments: This measure was revised on October 4, 2011. The items revised/edited were 1c.1, 1c.7, 1c.15, 1c.21, 1c.22, 1c.23, 2a2.2, 2a1.3, 2a1.7, 2a1.9, and 2a1.20.

Specific CROWNWeb data fields/numbers and the relevant response options were identified in the measure specifications. Additional information regarding the quality of the body of evidence and consistency of results across studies was added. Rationale for our reliability testing and a signal-to-noise analysis was also added.

Date of Submission (MM/DD/YY): 06/23/2011
Vascular Access
CPM I: Maximizing Use of Arteriovenous Fistula (AVF) in Maintenance Hemodialysis (HD) Patients
Numerator: All patients dialyzed using an autogenous AVF with two needles during the last HD treatment of the month.
Denominator: All adult patients (≥ 18 years old) on maintenance HD during last HD treatment of the month. Including home hemodialysis patients.
