MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 2870
Measure Title: Overuse of Opioid Containing Medications for Primary Headache Disorders
Measure Steward: American Academy of Neurology
Brief Description of Measure: Percentage of patients aged 12 years and older diagnosed with primary headache disorder, and taking an opioid containing medication who were assessed for opioid containing medication overuse within the 12-month measurement period, and treated or referred for treatment if identified as overusing opioid containing medication.
Developer Rationale: Triptans and ergots are considered first line acute treatments for migraine, not opioids or barbiturates by the US Headache Consortium Guideline. The use of barbituates or opioids increases the risk of chronic daily headache and drug induced hyperalgesia. In one study, any use of barbituates and opiates was associated with increased risk of transformed migraine after adjusting for covariates, while triptans were not. In a sample of 5, 796 people with headache, 4,076 (70.3%) were opioid nonusers, 798 (13.8%) were previous users, and 922(15.9%) were current opioid users.

Rates of headache-related health-care resource utilization were higher for all opioid-use groups for emergency department/urgent care, primary care, and specialty care visits compared to nonusers. Opioid use for migraine is associated with more severe headache-related disability, symptomology, comorbidities (depression, axiety, and cardiovascular disease and events), and greater health-care resource utilization for headache.
- Average headache frequency in days per month was higher among current opioid users
- Previous and current opioid users "had significantly higher average Migraine Disability Assessment (MIDAS) scores when compared to nonusers.
- Comorbidities tended to occur at higher rates among all opioid-use groups compared to nonusers, with depression significantly more common among opioid-use groups compared to nonusers.
- Health-care resource use was higher among previous and current opioid user

Numerator Statement: Patients assessed for opioid containing medication overuse within the 12-month measurement period and treated or referred for treatment if identified as overusing opioid containing medication which is defined as: Using opioid containing medication for greater than or equal to 10 days per month for more than 3 months.
Denominator Statement: All patients aged 12 years and older diagnosed with a primary headache disorder* and taking opioid containing medication.

*Define Primary Headache: A headache that is not caused by another disease or medical condition. For the purpose of this measure this includes the following types of headache:
Migraine - Migraine without aura, migraine with aura, childhood periodic syndromes that are commonly precursors of migraine, retinal migraine, complications of migraine, probable migraine.
Tension-Type Headache (TTH) - Infrequent episodic TTH, frequent episodic TTH headache, chronic TTH, probable TTH
Cluster Headache (CH) and Other Trigeminal Autonomic Cephalgias: Cluster headache, paraxysmal hemicrania, short-lasting unilateral neuralgia from headache attacks with conjuctival injection and tearing (SUNCT), probably trigeminal autonomic cephalgia
Other Primary Headaches: Primary stabbing headache, primary cough headache, primary exertional headache, primary

headache associated with sexual activity, hypnic headache, primary thunderclap headache, hemicrania continua, new daily-persistent headache.
Denominator Exclusions: No Exclusions.

Medical exceptions for not assessing, treating, or referring patient for treatment of opioid medication overuse include:
Patient already assessed and treated for opioid use disorder within the last year.
Patient has a documented failure of non-opioid options and is not identified as overusing opioid containing medication.
Patient has contraindications to all other medications for primary headache.

Measure Type: Process
Data Source: Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Registry
Level of Analysis: Clinician : Individual

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☐ **Yes** ☒ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☐ **Yes** ☒ **No**
- **Evidence graded?** ☐ **Yes** ☒ **No**

Evidence Summary

The developer cites four clinical practice guidelines that recommend against the use of opioids in primary headache disorders and one clinical guideline that suggests referral to a neurologist/specialist. One of the references listed as a clinical guideline is questionable regarding classification as a guideline and appears to be more of a summary of the evidence; despite this it does appear to support the harms of overutilization of opioids. An open area of question is if the guideline evidence supports the remaining measure concepts: assessed for overuse and treatment or referral.

This measure focus seems to be on the interventions of 1) assessing for overuse of opioid medications in a typical headache patient population and 2) for those patients identified as being over-users of opioid medications there should be evidence of treatment for that overuse or a documentation of referral for treatment. The evidence submitted substantiates the harms and clinical guideline recommendations against opioid use, but does not support the processes (interventions) of referral and treatment

Exception to evidence
N/A

Questions for the Committee:

- *Does the Committee agree there was no evidence submitted to support the full measure conceptual model? Assessment – identification – referral/treatment? Would the Committee rate the evidence as low? Or insufficient?*
- *Did the developer clearly state the relationship of the measure to patient outcomes?*
- *Is there evidence available to support the identification of opioid over-utilizers and the impact of*

referral/treatment on the intended outcomes?

- *For possible exception to the evidence criterion:*
  - *Are there, or could there be, performance measures of a related health outcome, OR evidence-based intermediate clinical outcomes, intervention/treatment?*
  - *Is there evidence of a systematic assessment of expert opinion beyond those involved in developing the measure?*
  - *Does the SC agree that it is acceptable (or beneficial) to hold providers accountable without empirical evidence?*

Guidance from the Evidence Algorithm

Process measure/systematic review (Box 3) No (evidence is about something other than what is being measured)→Empirical Evidence submitted but without systematic review and grading of the evidence (Box 7) No→performance measures of related health outcome or intermediate outcome or process (Box 10) Yes →Insufficient (premise of the measure may not be incorrect, the issue is that evidence was not provided that supports the interventions leading to decrease in outcome (reduced use of opioids in typical headaches).

Preliminary rating for evidence: ☐ **High** ☐ **Moderate** ☐ **Low** ☒ **Insufficient**

Preliminary rating for evidence: ☐ **Pass** ☒ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

Information on performance of measure, as specified, was not provided in the measure submission form. Data cited regarding the overuse of opioid use in migraine sufferers indicated that in one study, 13.8% of patients had evidence of previous use and 15.9% current use. The developers did provide 4 citations regarding the treatment and management of migraines/headaches, but a summary was not provided to assess impact, quality gap or opportunity for improvement. Prevalence and cost data support potential impact of improved management of migraine/headaches.

Disparities

Only general prevalence data was provided: In US population studies, the prevalence of migraine is approximately 18% in women and 6% in men. The prevalence of migraine in children is 7.7%.

Questions for the Committee:

- *In evaluating performance gap, the Committee should consider the demonstration of quality problems and opportunity for improvement. The developers provide some data on the prevalence of migraines and the use of opioids in the population, but very little additional data. Is there additional data that demonstrate opportunity for improvement or quality problems specific to the assessment, referral and treatment of overuse of opioids?*
- *Is there a gap in care that warrants a national performance measure?*
- *Are you aware of evidence that disparities exist in this area of healthcare?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☐ **Low** ☒ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **Insufficient evidence

**This a very important issue, but the data in support of the measure are very limited. As pointed out by Latana, the specific criterion has a somewhat arbitrary nature which will doubtless miss important over-prescriptions or inappropriate prescriptions. How does one deal with self-medication with now commonly available street drugs - opiates and otherwise? As a trial this may be worthy of support to promote further research but I would like to see some of the conceptual issues resolved or better supported by data before going there. The referral to treatment criterion, while measurable seems a very mushy test of overuse - especially with the potential for patients to find street drug substitutes or other analgesics.

**insufficient

1b. Performance Gap

Comments: **No data on performance

**No data presented - There is doubtless excessive opiate prescription for many things, including primary headache. My bias is to focus on the incidence of appropriate treatments of primary headache rather than on the overuse of inappropriate treatments with various potential adverse consequences.

**insufficient

1c. High Priority (previously referred to as High Impact)

Comments: **NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic clinical data, EHR

Specifications: Patients assessed for opioid containing medication overuse within the 12-month measurement period and treated or referred for treatment if identified as overusing opioid containing medication which is defined as: Using opioid containing medication for greater than or equal to 10 days per month for more than 3 months. The denominator is All patients aged 12 years and older diagnosed with a primary headache disorder* and taking opioid containing medication. There are no exclusions, but there are medical exceptions that could be found in the EHR. The measure is not risk adjusted.

This is a new eMeasure – HQMF specification are included. See eMeasure Technical Review below

Questions for the Committee :

- *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No** **eMeasure Trial Approval Technical Review has found that:** • The submitted eMeasure specification captures the data elements and measure logic needed for automated measure calculation
Documentation of HQMF or QDM	All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM;

limitations	
Value Sets	Value sets used in the submitted eMeasure are published in the NLM Value Set Authority Center.
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously
Feasibility Testing	The feasibility analysis submitted by the measure developer meets the requirements to be considered for eMeasure Trial Approval.

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Method(s) of reliability testing This is an emeasure being considered for Trial approval, as such reliability and validity testing results are not needed for submission. The developer has indicated they are partnering with Minnesota Community Measurement to test this measure at the individual clinician level. See notes about emeasure technical review above.

The Committee will not be asked to vote on Reliability

Questions for the Committee:

- *The developer provides a brief summary of testing plans, do you have specific questions on the planned method of reliability testing?*

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☐ **Yes** ☐ **Somewhat** ☒ **No**
Specification not completely consistent with evidence

The specifications for this measure report if patients are assessed for overuse of opioids, and then if referral or treatment occurred. The evidence provided supports that opioids may be commonly overused in the headache population and should not be; but evidence was not provided on the relationship between assessment, and treatment or referral to the actual outcome – which is assumed to be better headache management.

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

Validity will be tested by both Minnesota Community measurement and in the future through the AAN's Axon

Registry. The Committee will not be asked to vote on Validity for this emeasure under consideration for trial approval.

Questions for the Committee:

- *Other specific question of the validity testing?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

Exclusions and the burden of exclusions included in the measures are evaluated not only as the e-measures are developed but on an ongoing basis. The AAN has a system in place to garner user feedback from those members participating in the AAN's Axon Registry, burden of exclusions is an issue the AAN will continue to assess participants of the registry.

The currently specified exclusions are:

Medical exceptions for not assessing, treating, or referring patient for treatment of opioid medication overuse include:

Patient already assessed and treated for opioid use disorder within the last year.

Patient has a documented failure of non-opioid options and is not identified as overusing opioid containing medication.

Patient has contraindications to all other medications for primary headache.

Questions for the Committee:

- *Are there any exclusions you would expect to see in this measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

N/A

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods:

N/A

2b7. Missing Data

N/A

Preliminary rating for validity: ☐ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **No

**Not voting here. I see major difficulties in establishing a good clean validity measure.

2a2. Reliability Testing

Comments: **NA

**Not voting here.

**Validity is limited by variability of patients and settings.

Re. Patients

-- comorbidities may be significant factor in opioid decision

--acute versus chronic h/o headache may be different populations

Re. Settings

--Differences underlying opioid decision between ER versus Outpatient Care versus Inpatient Care may require additional supporting evidence

2b2. Validity Testing

Comments: **NA

**As mentioned above, data on alternative treatments (including self-medications, and "alternative" therapies) are a problem that needs to be address - though I suspect with considerable difficulty

**variability of patients and settings limits broad application of this measure until more is known about homogeneity/heterogeneity of headache opioid-treatment population.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **NA

**Not voting here.

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

This measure is proposed as an eMeasure for trial use, as such, it underwent an feasibility assessment by an eMeasure technical advisor. The developer also provided information from testing conducted by a contractor (Lantana) regarding feasibility:

- The Lantana team shared potential challenges in the measure related to data standards:
  - Non-use codes for treatment—Currently this concept is not captured discretely in Behavioral Health Information Technology systems. According AAN, neurologists do not currently utilize any standard codes. Candidate for revision is Referral for Opioid Overuse Treatment SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.90.
  - Failed treatment—This procedure is not consistently documented or captured in EHRs. Candidate for revision is Treatment Failure SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.93.
  - Opioid assessments—There is no standard form or question that captures data related to whether an opioid assessment was conducted. Candidate for revision is Opioid Overuse Assessment SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.89.
  - Opioid overuse—The current definition of this concept captures only overuse fitting the precise description. Example: patient takes opioids three times a day, every day for 2 months, would not be considered as overusing.
  - Calculating cumulative opioid use—The QDM is limited in its ability to calculate cumulative medication when not used for consecutive days.
  - Expression of PRN ("as needed") medication orders—Measure logic is limited in representing the variability in PRN orders
  - The Lantana team recommends that the three other categories of the feasibility assessment take place as part of the beta testing phase of this measure and suggests AAN review the noted value set concepts to improve their specificity. New code requests or post-coordinated concepts may be an option to express detailed clinical information. This further exploration of feasibility will support the successful adoption and implementation of the measure."

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery? Is there any additional advise you can provide to the development team to improve the feasibility and thus the eventual reliability of this measure?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *If an eMeasure, does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems*

and sites?

Preliminary rating for feasibility: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Low

**While the data in the EHR (assuming all entered appropriately) could be easily extracted, there are lots of questions about the criteria - and thus the accuracy of those data. Nonetheless, this is a major problem and it may be appropriate to start somewhere, even if that somewhat appears to have many flaws.

**weak definition of "opioid overuse" and insufficient granularity of data collection re. relationship between individual patients and treatment decisions.

** As indicated by the Lantana assessment, the required data elements are inconsistently documented as part of routine clinical care and, likely, rarely coded in the diagnoses. It would appear there would often be missing data elements, if this measure were to be implemented. Agree with the preliminary rating of low.

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure [from OPUS]

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☐ **Yes** ☒ **No**

OR

Planned use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details

- The only current use of the measure reported by the developers is the American Academy of Neurology Axon Registry. Currently an internal benchmarking quality registry with plans to expand to external benchmarking. This tool enables neurology practices to identify and improve gaps in the quality of neurologic care. Axon Registry was launched in Q3 of 2015. The Overuse of Opioid Containing Medications for Primary Headache Disorders measure will be incorporated into the registry in 2016. Currently there are 3 pilot cohorts in progress providing data to the registry. Axon Registry is currently being piloted and will be available to all AAN US members. Currently, there are 42 practices (487 neurology providers) in the 3 pilot cohorts.
- This measure has been submitted to CMS for consideration for use in Physician Quality Reporting System (PQRS) and Merit-based Incentive Payment Systems (MIPS). Additionally, the AAN continues to outreach and partner with private payers to implement AAN developed measures in their payment programs.

Improvement results

- Developer states that data collection through the AAN´s Axon Registry was initiated in Q3 of 2015. Data validation is ongoing, and further analysis of performance is not available at this time.

Potential harms: The developer did not identify any unintended consequences related to this measure.

Feedback :

- This measure was submitted for MAP review for the Medicare Shared Savings Program in 2015. MAP determined that as a clinician-only level measure, this measure did not meet objectives for MSSP. Also in 2015,

this measure was reviewed for Physician Quality Reporting System, Physician Compare, Physician Feedback, and Value-Based Payment Modifier programs.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **In pilot program with neurology practices

**This could be very usable - even with all the issues noted above. As mentioned, I'd prefer the positive vs. the negative approach (frequency of use of the better/appropriate treatments). This could bypass some of the issues of arbitrary criteria.

**At the present time, the benefits of this measure do 'not' outweigh any potential unintended consequences.

** Care would need to be exercised in determination of how or if these results should be reported publically. It could be imagined that they could be used by opioid seekers to identify prescribers who were more likely to use opioids in the treatment of headache.

Criterion 5: Related and Competing Measures

Related or competing measures

None

Harmonization

N/A

Pre-meeting public and member comments

Comment by Amy Elaine Sanders, MD

Organization American Academy of Neurology

Comment #5572: This is an extremely important measure, with an enormous gap in care. EDs especially but also many physicians routinely prescribe opioids. Yet opioids are largely ineffective in controlling pain and are often the precipitant of rebound headache, which takes an already bad problem and makes it worse.

NATIONAL QUALITY FORUM—Evidence (subcriterion 1a)

Measure Number (*if previously endorsed*)**:** Click here to enter NQF number
Measure Title: Overuse of Opioid Containing Medications for Primary Headache Disorders
IF the measure is a component in a composite performance measure, provide the title of the Composite Measure here: Click here to enter composite measure #/ title

Date of Submission: 1/15/2016
Additional information submitted 3/29/2016

Instructions

- *For composite performance measures:*
  - *A separate evidence form is required for each component measure unless several components were studied together.*
  - *If a component measure is submitted as an individual performance measure, attach the evidence form to the individual measure submission.*
- Respond to all questions as instructed with answers immediately following the question. All information needed to demonstrate meeting the evidence subcriterion (1a) must be in this form. An appendix of *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 10 pages (*incudes questions/instructions*; minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the evidence for this measure meets NQF's evaluation criteria.

1a. Evidence to Support the Measure Focus
The measure focus is evidence-based, demonstrated as follows:

- Health outcome: [3] a rationale supports the relationship of the health outcome to processes or structures of care. Applies to patient-reported outcomes (PRO), including health-related quality of life/functional status, symptom/symptom burden, experience with care, health-related behavior.
- Intermediate clinical outcome: a systematic assessment and grading of the quantity, quality, and consistency of the body of evidence [4] that the measured intermediate clinical outcome leads to a desired health outcome.
- Process: [5] a systematic assessment and grading of the quantity, quality, and consistency of the body of evidence [4] that the measured process leads to a desired health outcome.
- Structure: a systematic assessment and grading of the quantity, quality, and consistency of the body of evidence [4] that the measured structure leads to a desired health outcome.
- Efficiency: [6] evidence not required for the resource use component.

Notes

3. Generally, rare event outcomes do not provide adequate information for improvement or discrimination; however, serious reportable events that are compared to zero are appropriate outcomes for public reporting and quality improvement.
4. The preferred systems for grading the evidence are the U.S. Preventive Services Task Force (USPSTF) grading definitions and methods, or Grading of Recommendations, Assessment, Development and Evaluation (GRADE) guidelines.
5. Clinical care processes typically include multiple steps: assess → identify problem/potential problem → choose/plan intervention (with patient input) → provide intervention → evaluate impact on health status. If the measure focus is one step in such a multistep process, the step with the strongest evidence for the link to the desired outcome should be selected as the focus of measurement. Note: A measure focused only on collecting PROM data is not a PRO-PM.
6. Measures of efficiency combine the concepts of resource use and quality (see NQF's Measurement Framework: Evaluating Efficiency Across Episodes of Care; AQA Principles of Efficiency Measures).

1a.1.This is a measure of: (*should be consistent with type of measure entered in De.1*)
Outcome

☐ Health outcome: Click here to name the health outcome

☐Patient-reported outcome (PRO): Click here to name the PRO
PROs include HRQoL/functional status, symptom/symptom burden, experience with care, health-related behaviors

☐ Intermediate clinical outcome (*e.g., lab value*): Click here to name the intermediate outcome

☒ Process: Assessing patients for opioid containing medication overuse and treated or referred for treatment

☐ Structure: Click here to name the structure

☐ Other: Click here to name what is being measured

HEALTH OUTCOME/PRO PERFORMANCE MEASURE *If not a health outcome or PRO, skip to 1a.3*

1a.2. Briefly state or diagram the path between the health outcome (or PRO) and the healthcare structures, processes, interventions, or services that influence it.

1a.2.1. State the rationale supporting the relationship between the health outcome (or PRO) to at least one healthcare structure, process, intervention, or service (*i.e., influence on outcome/PRO*).

Note: For health outcome/PRO performance measures, no further information is required; however, you may provide evidence for any of the structures, processes, interventions, or service identified above.

INTERMEDIATE OUTCOME, PROCESS, OR STRUCTURE PERFORMANCE MEASURE

1a.3. Briefly state or diagram the path between structure, process, intermediate outcome, and health outcomes. Include all the steps between the measure focus and the health outcome.

Triptans and ergots are considered first line acute treatments for migraine, not opioids or barbiturates by the US Headache Consortium Guideline.(1) The use of barbiturates or opioids increases the risk of chronic daily headache and drug induced hyperalgesia.(2) In one study, any use of barbiturates and opiates was associated with increased risk of transformed migraine after adjusting for covariates, while triptans were not.(3) In a sample of 5,796 people with headache, 4,076 (70.3%) were opioid nonusers, 798 (13.8%) were previous users, and 922 (15.9%) were current opioid users. Rates of headache-related health-care resource utilization were higher for all opioid-use groups for emergency department/urgent care, primary care, and specialty care visits compared to nonusers.(4) Opioid use for migraine is associated with more severe headache related disability, symptomology, comorbidities (depression, anxiety, and cardiovascular disease and events), and greater health-care resource utilization for headache. (4)

- Average headache frequency in days per month was higher among current opioid users. (4)
- Previous and current opioid users "had significantly higher average Migraine Disability Assessment (MIDAS) scores when compared to nonusers" . (4)
- Comorbidities tended to occur at higher rates among all opioid-use groups compared to nonusers, with depression significantly more common among opioid-use groups compared to nonusers . (4)
- Health-care resource use was higher among previous and current opioid user. (4)

Using the recommended first-line treatments for migraine would provide superior pain relief for migraine sufferers and reduce overuse of chronic daily headaches.

The 10 days/month for 3 months is diagnostic criteria taken directly from the International Classification of Headache Disorders, 3rd Edition. To meet the diagnostic criteria for opioid-overuse headache, a screening would be needed to confirm they meet these diagnostic criteria.

"8.2.4 Opioid-overuse headache
Diagnostic criteria:
1. Headache fulfilling criteria for 8.2 Medication-overuse Headache

2. Regular intake of one or more opioids1 on 10 days per month for >3 months."

"8.2 Medication-overuse headache (MOH)
Description:
Headache occurring on 15 or more days per month developing as a consequence of regular overuse of acute or symptomatic headache medication (on 10 or more, or 15 or more days per month, depending on the medication) for more than 3 months. It usually, but notinvariably, resolves after the overuse is stopped.
General comment:
In the criteria set out below for the various subtypes, the specified numbers of days of medication use considered to constitute overuse are based on expert opinion rather than on formal evidence."

Additional supporting literature addressing medication overuse headache and treatment are attached and include:

The AAN is unaware of any guidelines developed that address referral and treatment to specialty care as such guideline statements could be viewed as self-serving with inherent bias from their creators. The need for specialty treatment following the identification of an opioid abuse concern is standard care. It is often in the patient's best interest to be referred to a provider who specializes in persistent headache, a provider who specializes in drug treatment and behavioral therapies, or detoxification center, such a referral must be personalized to the individual patient's situation. Although not specific to headaches, the CDC released their final guidelines on March 15, 2016 for chronic pain which includes the Class A recommendation "Clinicians should offer or arrange evidence-based treatment (usually medication-assisted treatment with buprenorphine or methadone in combination with behavioral therapies) for patients with opioid use disorder." It is noted most providers are not equipped to provide buprenorphine or methadone with behavioral therapies warranting a referral to treatment. These positions are held by the American Headache Society, the International Headache Society, and the American Academy of Neurology, and were signed off by all the member organization representatives that were part of the AAN headache quality measures development project.

1a.3.1. What is the source of the systematic review of the body of evidence that supports the performance measure?

☒ Clinical Practice Guideline recommendation – ***complete sections 1a.4, and 1a.7***

☐ US Preventive Services Task Force Recommendation – ***complete sections 1a.5 and 1a.7***

☐ Other systematic review and grading of the body of evidence (*e.g., Cochrane Collaboration, AHRQ Evidence Practice Center*) – ***complete sections 1a.6 and 1a.7***

☒ Other – ***complete section 1a.8***

Please complete the sections indicated above for the source of evidence. You may skip the sections that do not apply.

_____

1a.4. CLINICAL PRACTICE GUIDELINE RECOMMENDATION

1a.4.1. Guideline citation (*including date*) and **URL for guideline** (*if available online*):

1a.4.2. Identify guideline recommendation number and/or page number and **quote verbatim, the specific guideline recommendation**.

A. 1.3.8 Do not offer opioids for the acute treatment of tension-type headache

B. Oral opiate combinations may be considered for use in acute migraine when sedation side effects will not put the patient at risk and/or the risk for abuse has been addressed.

Parenteral opiates may be considered for rescue therapy in a supervised setting for acute migraine when sedation side effects will not put the patient at risk and when the risk abuse has been addressed.

C. Don't use opioid or butalbital treatment for migraine except as a last resort

D. Headache and other problems: Opioids are not usually indicated for migraine or TTH, or for patients with functional gastrointestinal problems. (No level of evidence noted)

E. Refer patients with significant headache to a neurologist for evaluation and treatment. (No level of evidence noted)

1a.4.3. Grade assigned to the quoted recommendation <u>with definition</u> of the grade:

A. No grade

B. Grade A
Grade B

C. No grade

D. No grade

E. Grade B

1a.4.4. Provide all other grades and associated definitions for recommendations in the grading system. (*Note: If separate grades for the strength of the evidence, report them in section 1a.7.*)

A. N/A

B.

A. Multiple well-designed randomized clinical trials, directly relevant to the recommendation, yielded a consistent pattern of findings.

B. Some evidence from randomized clinical trials supported the recommendation, but the scientific support was not optimal. For instance, either few randomized trials existed, the trials that did exist were somewhat inconsistent, or the trials were not directly relevant to the recommendation. An example of the last point would be the case where trials were conducted using a study group that differed from the target group for the recommendation.

C. The US Headache Consortium achieved consensus on the recommendation in the absence of relevant randomized controlled trials.

C. N/A

D. TBD

E. The development process of this guideline follows a systematic approach described in "Guideline-forGuidelines," an internal working document of the VA/DoD Evidence-Based Practice Working Group that requires an ongoing review of the work in progress. Appendix A clearly describes the guideline development process followed for this guideline. In completing this OT guideline update, the WG relied heavily on the following evidence-based guideline: Chou R, Fanciullo GJ, Fine PG, et al. Clinical Guidelines for the Use of Chronic Opioid Therapy in Chronic Noncancer Pain. (APS/AAPM) The Journal of Pain 2009(Feb); 10(2):113-230. The WG reviewed the APS/AAPM 2009 guideline and made the decision to adopt several of their recommendations. The Working Group developed a revised comprehensive clinical algorithm that incorporates the assessment and determination of the appropriateness of OT as well as the management of therapy. Additional recommendations were added addressing treatment of specific adverse effects and for the diagnosis and management of aberrant behaviors that the Working Group considered to be of importance to patients in the healthcare systems of the VA and DoD.

1a.6.1. Citation (*including date*) and **URL** (*if available online*):

1a.6.2. Citation and URL for methodology for evidence review and grading (*if different from 1a.6.1*)**:**

Complete section 1a.7

_____
1a.7. FINDINGS FROM SYSTEMATIC REVIEW OF BODY OF THE EVIDENCE SUPPORTING THE MEASURE
If more than one systematic review of the evidence is identified above, you may choose to summarize the one (or more) for which the best information is available to provide a summary of the quantity, quality, and consistency of the body of evidence. Be sure to identify which review is the basis of the responses in this section and if more than one, provide a separate response for each review.

1a.7.1. What was the specific structure, treatment, intervention, service, or intermediate outcome addressed in the evidence review?

A. In people with chronic or episodic migraine (with or without aura), what is the clinical evidence and cost-effectiveness of prophylactic pharmacological treatment with:
   - ACE (angiotensin converting enzyme) inhibitors and angiotensin II receptor antagonists
   - Antidepressants (SNRIs, SSRIs, tricyclics)
   - Centrally acting alpha-adrenergic-receptor agonists
   - Beta blockers
   - Calcium channel blockers
   - Antiepileptics
   - Other serotonergic modulators
   - NMDA receptor antagonists

   Outcomes considered were: change in migraine/headache days, 50% responder, and change in migraine/headache severity, change in migraine frequency, quality of life, change in acute medication use and serious adverse events.
B. The objective of the US Headache Consortium is to develop scientifically sound, clinically relevant practice guidelines on chronic headache for the primary care setting. This specific Guideline reviews the pharmacological treatment of acute migraine attacks.
   The US Headache Consortium identified the following goals of long-term migraine treatment:

· reduce attack frequency and severity,
· reduce disability,
· improve quality of life,
· prevent headache,
· avoid headache medication escalation, and
· educate and enable patients to manage their disease.

C. N/A

D. Summarizes the experience with COT for intractable headache, including the transformation from optimism about the potential to the current position that COT should rarely be administered to headache patients. COT should only be considered for those who meet strict criteria, and following rigorous procedures to assess response, adherence, and adverse effects. Moreover, prior to initiating COT, the prescribing physician should detail an explicit plan with the patient for opioid discontinuation if and when this becomes appropriate or necessary.

E. Scope of the Guideline:
• Offers best practice advice on the care of adults who may benefit from OT
• Addresses assessment and evaluation of chronic pain and appropriateness of OT
• Discusses primary intervention, referral, consultation and shared care in OT
• Addresses initiation, titration and maintenance of OT
• Presents and discusses formal treatment plans and treatment agreements for OT
• Presents updated pharmacotherapy advice on opioid medications that are FDA approved
• Provides guidance on assessing response to treatment, and determinations of adherence or abuse (aberrant drug-related behaviors)
• Addresses discontinuation of opioid therapy and follow-up • Discusses potential outcomes
• Does not address the use of opioids for patients receiving end of life treatment

1a.7.2. Grade assigned for the quality of the quoted evidence <u>with definition</u> of the grade:

A. There was no evidence identified for the effectiveness of this evidence, the recommendation is based on the absence of evidence and GDG informal consensus.

1. A quality rating was assigned, based on the study design. RCTs start HIGH and observational studies as LOW, uncontrolled case series as LOW or VERY LOW.
2. The rating was then downgraded for the specified criteria: Study limitations, inconsistency, indirectness, imprecision and reporting bias. These criteria are detailed below. Observational studies were upgraded if there was: a large magnitude of effect, dose-response gradient, and if all plausible confounding would reduce a demonstrated effect or suggest a spurious effect when results showed no effect. Each quality element considered to have 'serious' or 'very serious' risk of bias were rated down -1 or -2 points respectively.
3. The downgraded/upgraded marks were then summed and the overall quality rating was revised. For example, all RCTs started as HIGH and the overall quality became MODERATE, LOW or VERY LOW if 1, 2 or 3 points were deducted respectively.

B. Grade A

A. Multiple well-designed randomized clinical trials, directly relevant to the recommendation, yielded a consistent pattern of findings.

B. Some evidence from randomized clinical trials supported the recommendation, but the scientific support was not optimal. For instance, either few randomized trials existed, the trials that did exist were somewhat inconsistent, or the trials were not directly relevant to the recommendation. An example of the last point would be the case where trials were conducted using a study group that differed from the target group for the recommendation.

C. The US Headache Consortium achieved consensus on the recommendation in the absence of relevant randomized controlled trials.

D. No grades given

E.

A. A strong recommendation that clinicians provide the intervention to eligible patients. Good evidence was found that the intervention improves important health outcomes and concludes that benefits substantially outweigh harm.
B. A recommendation that clinicians provide (the service) to eligible patients. At least fair evidence was found that the intervention improves health outcomes and concludes that benefits outweigh harm.
C. No recommendation for or against the routine provision of the intervention is made. At least fair evidence was found that the intervention can improve health outcomes, but concludes that the balance of benefits and harms is too close to justify a general recommendation.
D. Recommendation is made against routinely providing the intervention to asymptomatic patients. At least fair evidence was found that the intervention is ineffective or that harms outweigh benefits.
I. The conclusion is that the evidence is insufficient to recommend for or against routinely providing the intervention. Evidence that the intervention is effective is lacking, or poor quality, or conflicting, and the balance of benefits and harms cannot be determined.

1a.7.3. Provide all other grades and associated definitions for strength of the evidence in the grading system.

1a.7.4. What is the time period covered by the body of evidence? (*provide the date range, e.g., 1990-2010*). Date range: A. Dates not given. B. Dates not given. D. Through May 2005. E. January 2003 to March 2009.

QUANTITY AND QUALITY OF BODY OF EVIDENCE

1a.7.5. How many and what type of study designs are included in the body of evidence? (*e.g., 3 randomized controlled trials and 1 observational study*)

A. The recommendation is based on the absence of evidence and GDG informal consensus
B. TBD
C. TBD
D. Included were 41 randomized trials.
E. 4 studies, Class 1, fair quality of evidence, Grade B recommendation.

1a.7.6. What is the overall quality of evidence across studies in the body of evidence? (*discuss the certainty or confidence in the estimates of effect particularly in relation to study factors such as design flaws, imprecision due to small numbers, indirectness of studies to the measure focus or target population*)

A. The recommendation is based on the absence of evidence and GDG informal consensus
B. Recommendations ranged from Levels A to C depending on the specific opiate recommendation.
C. TBD
D. Article does not describe effects, imprecision, etc. Most studies had high drop-out rates suggesting these studies are not high quality.
E. 4 studies, Class 1, fair quality of evidence, Grade B recommendation.

ESTIMATES OF BENEFIT AND CONSISTENCY ACROSS STUDIES IN BODY OF EVIDENCE

1a.7.7. What are the estimates of benefit—magnitude and direction of effect on outcome(s) across studies in the body of evidence? (*e.g., ranges of percentages or odds ratios for improvement/ decline across studies, results of meta-analysis, and statistical significance*)

A. The GDG agreed that pain free at 2 hours was the most important outcome. There is no evidence for the effectiveness of opioids in the acute treatment of tension type headache. GDG informal consensus agreed that there are considerable recognized side effects of opioids including an increased risk of medication overuse headache and therefore their use should not be recommended.
B. Document did not discussion estimates of benefit or magnitude and direction of effect on outcome.
C. TBD
D. One meta analysis found that mean pain relief with opioids was about 30%, with only a minority appearing to benefit from long-term treatment. In one study reviewed, only 20% of patients had still had relief with oral morphine after one year. Five studies found no significant difference between opioid or placebo treatment. Despite some benefit from short-term use of opioids, only 44% of 388 patients who were offered continued COT elected to remain on opioids for periods ranging between 7 and 24 months. Others have subsequently noted that "The evidence base for this type of pain management is meager because the needed randomized controlled trials, which ideally should last for several years, have not been performed".Another meta analysis concluded that weak evidence suggests that oral and intrathecal opioids reduce pain long-term for patients who benefit short-term with minimal adverse effects. There was insufficient data from transdermal studies to quantify pain relief.
E. Document did not discussion estimates of benefit or magnitude and direction of effect on outcome.

1a.7.8. What harms were studied and how do they affect the net benefit (benefits over harms)?

A. No studies reported outcome data for time to freedom from pain, headache response at up to 2 hours, headache response at 24 hours, freedom from pain at 24 hours, functional health outcomes, or incidence of serious adverse events. Study did not do a specific benefits vs. harms analysis.
B. The oral opiate analgesics reviewed were associated with a higher rate of adverse events than was placebo, but were similar to aspirin and better than ergotamine in that respect. The most commonly reported adverse events included dizziness, fatigue, nausea, and drowsiness. Adverse events were much more frequently reported with nasal butorphanol than with placebo or with oral opiate analgesics. Study did not do a specific benefits vs. harms analysis.
C. N/A
D. The most common adverse effect stemming from opioid administration is nausea, sometimes associated with emesis, occurring in 26% of 8855 patients in a retrospective cohort study of patients receiving short-term opioids in 35 community-based and tertiary hospitals. In one meta-analysis constipation and nausea were statistically significant.
E. Opioid therapy is a therapeutic trial. Prior to such a trial, the provider should determine that the potential benefits are likely to outweigh the potential harms, and the patient should be fully informed and should consent to the therapy. Opioid therapy should be tapered off and discontinued if real or potential harms outweigh real or potential benefits.

UPDATE TO THE SYSTEMATIC REVIEW(S) OF THE BODY OF EVIDENCE

1a.7.9. If new studies have been conducted since the systematic review of the body of evidence, provide for <u>each</u> new study: 1) citation, 2) description, 3) results, 4) impact on conclusions of systematic review.

A. No new studies on the use of opioids were included in the updated review of evidence NICE conducted in 2014. https://www.nice.org.uk/guidance/cg150/evidence/evidence-update-october-2014-2186959789
B. No new studies on the use of opioids that would change the recommendatons – document still stands as is.
C. N/A
D. No new studies on the use of opioids that would change this article.
E. No new studies on the use of opioids that would change the recommendations – document still stands as is.

1. On 3/22/216 the FDA announced required class-wide safety labeling changes for immediate-release (IR) opioid pain medications. Among changes, the FDA is requiring a new black boxed warning about the serious risks of misuse, abuse, addiction, overdose and death. The FDA is also requiring several additional safety labeling changes across all prescription opioid products to include additional information on the risk of these medications. These changes are part of the FDA's effort to inform prescribers about the importance of balancing the serious risks of opioids with their role in managing pain. Direct quote from Robert Califf, MD, FDA commissioner: "Opioid addiction and overdose have reached epidemic levels over the past decade, and the FDA remains steadfast in our commitment to do our part to help reverse the devastating impact of the misuse and abuse of prescription opioids." FDA Press Release. March 22, 2016. Available at: http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm491739.htm
2. On 3/15/16, the CDC released their CDC Guidelines for Prescribing Opioids for Chronic Pain 2016, which includes the following Class A recommendation:
    a. **Nonpharmacologic therapy and nonopioid pharmacologic therapy are preferred for chronic pain. Clinicians should consider opioid therapy only if expected benefits for both pain and function are anticipated to outweigh risks to the patient. If opioids are used, they should be combined with nonpharmacologic therapy and nonopioid pharmacologic therapy, as appropriate (recommendation category: A, evidence type: 3).**
    b. **Before starting and periodically during opioid therapy, clinicians should discuss with patients known risks and realistic benefits of opioid therapy and patient and clinician responsibilities for managing therapy (recommendation category: A, evidence type: 3).**
    c. **Before starting and periodically during continuation of opioid therapy, clinicians should evaluate risk factors for opioid-related harms. Clinicians should incorporate into the management plan strategies to mitigate risk, including considering offering naloxone when factors that increase risk for opioid overdose, such as history of overdose, history of substance use disorder, higher opioid dosages (≥50 MME/day), or concurrent benzodiazepine use, are present (recommendation category: A, evidence type: 4).**
    d. **Clinicians should avoid prescribing opioid pain medication and benzodiazepines concurrently whenever possible (recommendation category: A, evidence type: 3).**
    e. **Clinicians should offer or arrange evidence-based treatment (usually medication-assisted treatment with buprenorphine or methadone in combination with behavioral therapies) for patients with opioid use disorder (recommendation category: A, evidence type: 2).**

    The report includes the following as well: "… In some clinical contexts (e.g., headache or fibromyalgia), expected benefits of initiating opioids are unlikely to outweigh risks regardless of previous nonpharmacologic and nonopioid pharmacologic therapies used." Dowell D, Haegerich TM, Chou R. CDC Guideline for Prescribing Opioids for Chronic Pain — United States, 2016. MMWR Recomm Rep 2016;65:1–49. DOI: http://dx.doi.org/10.15585/mmwr.rr6501e1.
3. The American Headache Society released 5 Choosing Wisely statements in November/December 2013 which includes the statement: "(4) don't prescribe opioid- or butalbital-containing medications as a first-line treatment for recurrent headache disorders…" Choosing Wisely statements are intended as a starting point of treatment conversations for patients and providers. This statement supports that opioid prescription use for primary headache is not the standard of care. Loder E, Weizenbaum E, Frishberg B, Silberstein S; American Headache Society Choosing Wisely Task Force. Choosing wisely in headache medicine: the American Headache Society's list of five things physicians and patients should question. Headache 2013;53:1651–9

1a.8 OTHER SOURCE OF EVIDENCE

If source of evidence is NOT from a clinical practice guideline, USPSTF, or systematic review, please describe the evidence on which you are basing the performance measure.

1a.8.1 What process was used to identify the evidence?

F. Choosing Wisely mirrors the guideline development process. A narrow literature review was conducted.

1a.8.2. Provide the citation and summary for each piece of evidence.

C.

Silberstein SD; US Headache Consortium. Practice parameter: Evidence-based guidelines for migraine headache (an evidence-based review): Report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology [Internet]. 2000;55(6):754-762.

See information under B for summary of this article.

Evers S, Afra J, Frese A, Goadsby PJ, Linde M, May A, Sandor PS, European Federation of Neurological Societies. EFNS guideline on the drug treatment of migraine – revised report of an EFNS task force. Eur J Neurol [Internet]. 2009 Sep;16(9):968-81.

Summary: Opioids are of only minor efficacy, no modern controlled trials are available for these substances.

Institute for Clinical Systems Improvement. Headache, Diagnosis and Treatment of (Guideline) [Internet]. Bloomington, MN: Institute for Clinical Systems Improvement; 2011 [cited 2012 Oct 25]. Available from: www.icsi.org/headache/headache__diagnosis_and_treatment_of_2609.html.

Summary: Clinicians may manage mild migraines with over-the-counter medications. Clinicians may use triptans for mild migraine pain levels. Clinicians should avoid the use of opiates and barbiturates in the treatment of headache. In general, opiates are characterized by having a short pain-relief window, release inflammatory neurochemicals, and increase vasodilation; none of these addresses the currently known treatment issues and pathophysiology of migraine.

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
HA_MeasSubm_Evidence_2016-01-15.docx

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Triptans and ergots are considered first line acute treatments for migraine, not opioids or barbiturates by the US Headache Consortium Guideline. The use of barbituates or opioids increases the risk of chronic daily headache and drug induced hyperalgesia. In one study, any use of barbituates and opiates was associated with increased risk of transformed migraine after adjusting for covariates, while triptans were not. In a sample of 5, 796 people with headache, 4,076 (70.3%) were opioid nonusers, 798 (13.8%) were previous users, and 922(15.9%) were current opioid users.

Rates of headache-related health-care resource utilization were higher for all opioid-use groups for emergency department/urgent care, primary care, and specialty care visits compared to nonusers. Opioid use for migraine is associated with more severe headache-related disability, symptomology, comorbidities (depression, axiety, and cardiovascular disease and events), and greater health-care resource utilization for headache.
- Average headache frequency in days per month was higher among current opioid users
- Previous and current opioid users "had significantly higher average Migraine Disability Assessment (MIDAS) scores when compared to nonusers.
- Comorbidities tended to occur at higher rates among all opioid-use groups compared to nonusers, with depression significantly more common among opioid-use groups compared to nonusers.
- Health-care resource use was higher among previous and current opioid user

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
Using the recommended first-line treatments for migraine would provide superior pain relief for migraine sufferers and reduce overuse of chronic daily headaches.

1. Matchar DB, Young WB, Rosenberg J, et al. Multispecialty consensus on diagnosis and treatment of headache: pharmacological management of acute attacks. Available at http://www.aan.com/professionals/practice/pdfs/g10087.pdf

3. Bigal ME, Serrano D, Buse D, et al. Acute migraine medications and evoluation from episodic to chronic migraine: a longitudinal population-based study. Headache 2008; 48(8):1157-68
4. Buse DC, Pearlman SH, Reed ML, et al. Opioid Use and Dependence among Persons with Migraine: Results of the AMPP Study Headache. The Jouranl of Head and Face Pain 2012; 52(1):18-36.

1b.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity,**

gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Data analysis on disparities from the measure as specified has not been conducted at this time.

1b.5. **If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.**
Migraine ranks in the top 20 of the world´s most disabling medical illnesses. In US population studies, the prevalence of migraine is approximately 18% in women and 6% in men. The prevalence of migraine in children is 7.7%. Migraines affect 29.5 million Americans.

Headaches, notably migraine, are associated with significant disability. Migraine is strongly associated with anxiety and mood disorders, chronic pain disorders, and epilepsy. Headache can be attributed to comorbid conditions which need adequate management. Migraine is associated with increased risk for another physical and psychiatric comorbidities and this risk increases with headache frequency.

90% of people with headache have some headache-related disability, and approximately half are severely disabled or require bed rest. 9 out of 10 people with headache report they can´t "function normally" during days in which a migraine strokes and 3 in 10 require bed rest. More than 25% of migraine sufferers missed at least one day of work over the past three months due to a migraine.

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. **Demonstrated high priority aspect of healthcare**
Affects large numbers, A leading cause of morbidity/mortality
1c.2. **If Other:**

1c.3. **Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.**
Migraine ranks in the top 20 of the world´s most disabling medical illnesses. In US population studies, the prevalence of migraine is approximately 18% in women and 6% in men. The prevalence of migraine in children is 7.7%. Migraines affect 29.5 million Americans.

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not Applicable

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Behavioral Health : Alcohol, Substance Use/Abuse, Mental Health : Alcohol, Substance Use/Abuse, Neurology

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Care Coordination, Overuse, Safety : Medication Safety

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.aan.com/practice/quality-measures/

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** OpioidOverusePrimaryHeadache_v4_Artifacts_07202015_Bonnie.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** OpioidOverusePrimaryHeadache_v4_Fri_Jul_24_10.56.36_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Not applicable.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Patients assessed for opioid containing medication overuse within the 12-month measurement period and treated or referred for treatment if identified as overusing opioid containing medication which is defined as:
Using opioid containing medication for greater than or equal to 10 days per month for more than 3 months.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
12 months

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Measure is not applicable to claims reporting, and values for gathering information through EHR and Registry sources is attached in S.2b.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
All patients aged 12 years and older diagnosed with a primary headache disorder* and taking opioid containing medication.

*Define Primary Headache: A headache that is not caused by another disease or medical condition. For the purpose of this measure

this includes the following types of headache:
Migraine - Migraine without aura, migraine with aura, childhood periodic syndromes that are commonly precursors of migraine, retinal migraine, complications of migraine, probable migraine.
Tension-Type Headache (TTH) - Infrequent episodic TTH, frequent episodic TTH headache, chronic TTH, probable TTH
Cluster Headache (CH) and Other Trigeminal Autonomic Cephalgias: Cluster headache, paraxysmal hemicrania, short-lasting unilateral neuralgia from headache attacks with conjuctival injection and tearing (SUNCT), probably trigeminal autonomic cephalgia
Other Primary Headaches: Primary stabbing headache, primary cough headache, primary exertional headache, primary headache associated with sexual activity, hypnic headache, primary thunderclap headache, hemicrania continua, new daily-persistent headache.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Children's Health, Populations at Risk

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Measure is not applicable to claims reporting, and values for gathering information through EHR and Registry sources is attached in S.2b.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
No Exclusions.

Medical exceptions for not assessing, treating, or referring patient for treatment of opioid medication overuse include:
Patient already assessed and treated for opioid use disorder within the last year.
Patient has a documented failure of non-opioid options and is not identified as overusing opioid containing medication.
Patient has contraindications to all other medications for primary headache.

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Measure is not applicable to claims reporting, and values for gathering information through EHR and Registry sources is attached in S.2b.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. **Type of score:**

Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See S.2a for details

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No diagram provided

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
For use in the American Academy of Neurology (AAN) Axon Registry only - If data is missing from denominator, the case is deleted. If data met for denominator then case information is included for the measure.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Registry

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
The American Academy of Neurology (AAN) Axon Registry planned for 2016

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Clinician : Individual

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Ambulatory Care : Clinician Office/Clinic, Ambulatory Care : Urgent Care, Emergency Medical Services/Ambulance, Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not Applicable

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form

testing_form_for_trial_use_AAN_Opioids.docx

National Quality Forum

Measure Testing Form for Trial Approval Program

Measure Title: Overuse of Opioid Containing Medications for Primary Headache

Date of Submission: January 15, 2016

Type of Measure:

☐ Composite

☐ Outcome (*including PRO-PM*)

☐ Cost/resource

☐ Process

☐ Efficiency

☐ Structure

Instructions

- A measure submission that is to be considered for the Trial Approval Program must complete this form in its entirety. Either a test data set provided by the measure developer, or the use of the Bonnie tool is acceptable to provide preliminary testing results,
- **For <u>all</u> measures being submitted for potential acceptance into the Trial Approval Program, each section <u>must be filled out as completely as possible.</u>**
- Respond to <u>all</u> questions as instructed with answers immediately following the question. All information on testing of either a sample data set or results from Bonnie testing that can demonstrate, to the extent possible, the the measure meets the reliability and validity must be in this form..
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 10 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions at trialmeasures@qualityforum.org

<u>DATA and SAMPLING INFORMATION</u>

1. DATA/SAMPLE USED FOR <u>PRELMINARY</u> TESTING OF THIS MEASURE

It is important that the measure developer use a data set to conduct preliminary testing in order to evaluate the measure logic and the inclusions/exclusions for the population used in the measure.

- **What type of data was used for testing**? (*The measure developer must provide a test data set that will provide some initial information to be used for the evaluation, or the Bonnie testing tool can use can be used to create a sample data set using synthesized patients.)* Please indicate whether the test data set used was provided through the measure developer, or through the Bonnie tool.

Bonnie

- **If Bonnie was <u>NOT</u> used, please identify the specifications for the test dataset** (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured)*

- **What levels of analysis were tested (either through the test data set or Bonnie)**? (*testing must be provided for <u>all</u> the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*) *in order to determine its suitability for inclusion into the Trial Approval Program.,*

Individual clinician

Measure Specified to Measure Performance of:

Measure Tested at Level of:

☐ individual clinician

☐individual clinician

☐ group/practice

☐ group/practice

☐ hospital/facility/agency

☐ hospital/facility/agency

☐ other: Click here to describe

☐ other: Click here to describe

1.4. How many and which <u>patients</u> were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis)*

36 test cases in the Bonnie

1.5. Please refer to the guidance for Bonnie testing found at this link. Bonnie testing results may be compiled into spreadsheet or table, which must be completed in its entirety, to the extent possible, in order to provide a basis for evaluation to determine the acceptability of the measure for inclusion in the Trial Approval program. *Any questions regarding the completion of this form can be directed to NQF Staff at trialmeasures@qualityforum.org.*

<u>RELIABILITY AND VALIDITY ASSESSMENTS</u>

Note: The information provided in this next section is intended to aid the Standing Committee and other stakeholders in understanding to what degree the measure is both reliable and valid. While it is not possible to provide comprehensive results due to the lack of actual testing data, the developer needs to provide as much information as possible based on their interpretation of the results from the sample test data.

2.1 Reliability testing demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score. **What is your interpretation of the results in terms of demonstrating reliability**? (i.*e., what do the sample results mean and what are the norms for the test conducted?*) Please summarize the plan for future testing of reliability if the measure is accepted into the Trial Approval Program. Include descriptions of:

- Inter-abstractor reliability, and data element reliability of all critical data elements
- Computation of the performance measure score (e.g., signal-to-noise analysis)?

The AAN is currently working with Minnesota Community Measurement to test this measure for feasibility and reliability. The AAN will also utilize the Axon Registry to gather data collected directly from the participant's EHR to test for feasibility and reliability. The AAN's Axon Registry also constantly measures physician performance on this measure.

2.2 Validity testing demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score. **What is your interpretation of the results in terms of demonstrating validity**? (i.*e., what do the results mean and what are the norms for the test conducted?*). Please summarize the plan for future testing of validity if the measure is accepted into the Trial Approval Program. Include the method(s) of validity testing and what it will test (describe the steps—do not just name a method; what will be tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis will be used used)

See above, validity will be tested by both Minnesota Community measurement and in the future through the AAN's Axon Registry.

2.3 Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion. **What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results?** (*i.e., the value outweighs the burden of increased data collection and analysis).* Please summarize the plan for future testing of exclusions if the measure is accepted into the Trial Approval Program. Describe the method of testing exclusions and what it will test (describe the steps—do not just name a method; what will be tested, e.g., whether exclusions affect overall performance scores; what statistical analysis will be used)

Exclusions and the burden of exclusions included in the measures are evaluated not only as the e-measures are developed but on an ongoing basis. The AAN has a system in place to garner user feedback from those members participating in the AAN's Axon Registry, burden of exclusions is an issue the AAN will continue to assess participants of the registry.

2.4 Risk Stratification (applicable ONLY to outcome or resource use measures). If an outcome or resource use measure will not be risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities. If risk adjustment/stratification is needed then please describe the conceptual/clinical and statistical methods and criteria that will be used to select patient factors (clinical factors or sociodemographic factors) that will be used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

N/A

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score), Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry)

If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

ALL data elements are in defined fields in a combination of electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment **Attachment:** Opioid_Overuse_Headache_Feasibility.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

See attached Alpha Testing Results in Appendix. From report, "The Overuse of Opioid Containing Medications for Primary Headache Disorders measure passed all alpha testing, which relates to measure face validity, data element reliability, and measure logic testing. NQF recommends that an early feasibility assessment take place to determine data availability, data accuracy, data standards, and data workflow.

- Data availability—The extent to which the data are readily available in a structured format across EHR systems.
- Data accuracy—The extent to which the information contained in the data is correct. This includes whether the most accurate data source is used and/or captured by the most appropriate healthcare professional or recorder.
- Data standards—The extent to which the data element is coded using a nationally accepted terminology/vocabulary standard. Standard data elements, associated definitions and code sets, and mapping to the QDM are expected.
- Workflow—The extent to which the effort of capturing the data element interferes with a typical provider workflow.

A feasibility assessment conducted at the outset of the project addressed one of the four recommended categories for feasibility assessment: data standards.

Properly conducted eCQM testing and analysis is critical for endorsement by NQF and for success in implementing a measure. During reviews, Measure Analysts discussed issues related to feasibility with the Measure Steward. The Lantana team shared potential challenges in the measure related to date standards:

- Non-use codes for treatment—Currently this concept is not captured discretely in Behavioral Health Information Technology systems. According AAN, neurologists do not currently utilize any standard codes. Candidate for revision is Referral for Opioid Overuse Treatment SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.90.
- Failed treatment—This procedure is not consistently documented or captured in EHRs. Candidate for revision is Treatment Failure SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.93.
- Opioid assessments—There is no standard form or question that captures data related to whether an opioid assessment was conducted. Candidate for revision is Opioid Overuse Assessment SNOMEDCT Value Set; its associated OID is 2.16.840.1.113762.1.4.1111.89.
- Opioid overuse—The current definition of this concept captures only overuse fitting the precise description. Example: patient takes opioids three times a day, every day for 2 months, would not be considered as overusing.
- Calculating cumulative opioid use—The QDM is limited in its ability to calculate cumulative medication when not used for consecutive days.
- Expression of PRN ("as needed") medication orders—Measure logic is limited in representing the variability in PRN orders

The Lantana team recommends that the three other categories of the feasibility assessment take place as part of the beta testing phase of this measure and suggests AAN review the noted value set concepts to improve their specificity. New code requests or post-coordinated concepts may be an option to express detailed clinical information. This further exploration of feasibility will support the successful adoption and implementation of the measure."

3c.2. Describe any fees, licensing, or other requirements to use any aspect of the measure as specified *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees, licensing, or other requirements that impact use.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. **Current and Planned Use**

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
Payment Program Professional Certification or Recognition Program Quality Improvement with Benchmarking (external benchmarking to multiple organizations)	Quality Improvement (Internal to the specific organization) Axon Registry https://www.aan.com/practice/axon-registry/

4a.1. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

The American Academy of Neurology Axon Registry. Currently an internal benchmarking quality registry with plans to expand to external benchmarking. This tool enables neurology practices to identify and improve gaps in the quality of neurologic care. Axon Registry was launched in Q3 of 2015. The Overuse of Opioid Containing Medications for Primary Headache Disorders measure will be incorporated into the registry in 2016. Currently there are 3 pilot cohorts in progress providing data to the registry. Axon Registry is currently being piloted and will be available to all AAN US members. Currently, there are 42 practices (487 neurology providers) in the 3 pilot cohorts.

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)

No policies or actions restrict the use of the measure in accountability or public reporting programs, and no known barriers to implementation. Measurement set released January 2015, and has not been implemented to date.

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)

This measure has been submitted to CMS for consideration for use in Physician Quality Reporting System (PQRS) and Merit-based Incentive Payment Systems (MIPS). Additionally, the AAN continues to outreach and partner with private payers to implement AAN developed measures in their payment programs.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**

Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

Not available at this time. Data collection through the AAN´s Axon Registry was initiated in Q3 of 2015. Data validation is ongoing, and further analysis of performance is not available at this time.

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not Applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
No unintended negative consequences have been identified at this time.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures

Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
No

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Not Applicable

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed**

measure(s):
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Measure Developer/Steward Updates and Ongoing Maintenance

Ad.2 **Year the measure was first released:** 2015

Ad.3 **Month and Year of most recent revision:** 01, 2015

Ad.4 **What is your frequency for review/update of this measure?** Every 3 years

Ad.5 **When is the next scheduled review/update for this measure?** 01, 2017

Ad.7 **Disclaimers:** Physician Quality Measures (Measures) and related data specifications developed by the American Academy of Neurology (AAN) are intended to facilitate quality improvement activities by physicians. These measures are intended to assist physicians in enhancing quality of care. Measures are designed for use by any physician who manages the care of a patient for a specific condition or for prevention. The AAN encourages use of these Measures by other health care professionals, as appropriate. These Measures are not clinical guidelines and do not establish a standard of medical care, and have not been tested for all potential applications. The AAN encourages testing and evaluation of its Measures.
Measures are subject to review and may be revised or rescinded at any time by the AAN. The measures may not be altered without prior written approval from the AAN. The measures, while copyrighted, can be reproduced and distributed, without modification, for noncommercial purposes (e.g., use by health care providers in connection with their practices). Commercial use is defined as the sale, license, or distribution of the measures for commercial gain, or incorporation of the measures into a product or service that is sold, licensed, or distributed for commercial gain. Commercial uses of the measures require a license agreement between the user and the AAN. Neither the AAN nor its members shall be responsible for any use of the measures.

THESE MEASURES AND SPECIFICATIONS ARE PROVIDED “AS IS” WITHOUT WARRANTY OF
ANY KIND

NATIONAL QUALITY FORUM

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 2832
Measure Title: STK 02: Discharged on Antithrombotic Therapy
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients prescribed antithrombotic therapy at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy,STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. STK-2, Discharged on Antithrombotic Therapy, is one of six of the measures in this set that have been reengineered as eCQMs and are included in the EHR Incentive Program and Hospital Inpatient Quality Reporting Program.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. Studies have shown that antithrombotic therapy prescribed at discharge following acute ischemic stroke reduces stroke mortality and morbidity.

Healthcare organizations that track antithrombotic therapy prescribed at discharge for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to which will also promote improvements in quality at the national level.

Numerator Statement: Patients prescribed antithrombotic therapy at hospital discharge.
Denominator Statement: Patients with a principal diagnosis of ischemic stroke.
Denominator Exclusions: Patients with comfort measures documented.
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care

Denominator Exceptions:
Patients with a documented reason for not prescribing antithrombotic therapy at discharge.

Measure Type: Process
Data Source: Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Most Recent Endorsement Date:

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary:

Evidence for this new eMeasure is the same as the existing measure #0435 STK 02: Discharged on Antithrombotic Therapy:

- The body of evidence consistently supports that prolonged antithrombotic therapy reduces the risk of death in patients with a prior history of ischemic stroke. Based on these findings, antithrombotic therapy should be prescribed at discharge following acute ischemic stroke, unless there are contraindications to therapy.
- 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 249.
    - Class I, Level of Evidence A - For patients with noncardioembolic ischemic stroke or TIA, the use of antiplatelet agents rather than oral anticoagulation is recommended to reduce the risk of recurrent stroke or another cardiovascular event.
    - Aspirin (50 mg/d to 325 mg/d) monotherapy (Class I, Level of Evidence A), the combination of aspirin 25 mg and extended-release dipyridamole 200 mg twice daily (Class I, Level of Evidence B), and clopidogrel 75 mg monotherapy daily (Class IIa, Level of Evidence B), are all acceptable options for initial therapy. The selection of an antiplatelet agent should be individualized on the basis of patient risk factor profiles, cost, tolerance, and other clinical characteristics.

Questions for the Committee:

- *The developer attests the underlying evidence for the measure #0435 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure, therefore there is no need for repeat discussion and voting on Evidence?*

Guidance from the Evidence Algorithm: Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency: high (Box 5) → Box 5a High

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**
Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
    - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of data on 4 of 28 available eCQMs. This measure is 1 of the 28 eCQMs.

- The developer provided a summary of data from the literature that demonstrated underutilization of antithrombotic therapy and a performance gap in Medicare patients.
- The developer also provided performance data from the chart abstracted measure which seems to be very high with little to no room for improvement.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **No new studies/information

**This measure is the EHR measure -assesses same process as #0435-paper measure of antithrombotic therapy at discharge

**I am not aware of new data

1b. Performance Gap

Comments: **no performance data for e-version available; no disparities data

**Emeasure --no overall performance data vailable yet, In CY2016 CMS is requiring all organizations participating in HIQR to submit data for 1 quarter on 4 of 28 available emeasures (eCQMs). This is 1 of the 28 eCQMs.

**There is minimal performance gap

1c. High Priority (previously referred to as High Impact)

Comments: **NA

**Yes

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart

abstracted measure from which this measure is derived.

Questions for the Committee :

- o *Are all the data elements clearly defined? Are all appropriate codes included?*
- o *Is the logic or calculation algorithm clear?*
- o *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.

2a2. Reliability Testing Testing attachment

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 22 synthetic records created in the Bonnie testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Questions for the Committee:

- o *Is the test sample adequate to generalize for widespread implementation?*
- o *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Guidance from the Reliability Algorithm: Precise specifications (Box 1) →empiric reliability testing as specified (Box 2)

→ empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→Assessed the measure logic only (Box 11) →Low certainty or confidence data used in measure are valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

Question for the Committee:

o *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**
☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 22 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.
- The numerator, denominator, exclusions/exceptions , and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

o

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little to no room for improvement?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from Validity Algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box 2)→ empirical testing of data elements using BONNIE tool (Box 3,10))→Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments:

**specifications consistent

**Validity high- testing EHR derived data from paper record

**Specifications are consistent with the evidence

2a2. Reliability Testing

Comments:

**No

**Yes

**Validity testing supported the measure.

2b2. Validity Testing

Comments:

**yes

**Not enough actual data to draw a conclusion-but no reason to assume threat to validity

**Unknown

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments:
**Low reliability testing only data element level
**Not yet- no evidence that reliability will be compromised with Emeasure compared to paper chart extraction. Reliability should increase.
**Reliability was tested and indicate that the measure is repeatable

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow, or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Is it likely the required data elements are routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Concerned that developer was unable to directly assess data accuracy
**No concerns about feasibility of collecting required data elements. Discharge on appropriate antithrombotic therapy part of the "Get with the Guidelines" standards for all certified stroke programs.
**Required data elements are readily generated and the measure has been in use.

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Not publicly reported but in CMS accountability program with data accepted through Feb 2017. Usability seems promising/beneficial

**NA

**Measure has been in regular use

Criterion 5: Related and Competing Measures

Related or competing measures

- 0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
- 0435 : STK 02: Discharged on Antithrombotic Therapy
- 0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology – not NQF endorsed

Harmonization :

- Measure 0438, Antithrombotic Therapy By End of Hospital Day 2, is the fifth (STK-5) measure in The Joint

Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in this measure. All common data elements for these measures are completely harmonized.

- NQF#0435: STK 02: Discharged on Antithrombotic Therapy: The measures are completely harmonized to the extent possible, given the fact that the data source for #0435 is the paper medical record, and the data source for #2832 is the electronic health record.
- Measure 0068 is a physician level measure that encompasses a different target population, specifically patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI).

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NQF #: 0435 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent a secondary stroke following a new ischemic stroke. Antithrombotic prescribed at discharge >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the prevention of stroke in patients with stroke or transient ischemic attack. The Antiplatelet Trialists' Collaboration (1994) and later Antithrombotic Trialists' Collaboration (2002) have confirmed that the benefit of long-term antithrombotic therapy to patients with ischemic stroke is well established.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: In 2002, the Antithrombotic Trialists' Collaboration published a systematic overview of the relevant literature supporting antiplatelet therapy for prevention of death, myocardial infarction, and stroke in high risk patients. The collaboration reviewed 287 studies involving 135,000 patients in comparisons of antiplatelet therapy versus control and 77,000 patients in comparisons of different antiplatelet regimens. Twenty-one of the 287 trials were randomized control trials (n=18,270) involving patients with a history of stroke or transient ischemic attack allocated to a mean duration of 29 months of antiplatelet therapy. Since the previous meta-analysis (1994; 10,255 patients in 18 trials), the amount of information available on the effects of long-term antithrombotic therapy among patients with a history of stroke or transient ischemic attack has substantially increased, primarily due to the results of the second European Stroke Prevention Study (n-6602).

Relevant trials were identified through electronic database searches (MEDLINE, Embase, Derwent, Scisearch, and Biosis), searching the trials registers of the Cochrane Stroke and Peripheral Vascular Disease Groups; manual searching of journals, abstracts, and proceedings of meetings; scrutinizing the reference lists of trials and review articles; and professional inquiry, including colleagues and representatives of pharmaceutical companies.

Trials available by September 1997 that compared an antiplatelet regimen with a control or one antiplatelet regimen with another among patients considered to be high annual risk (> 3%/year) of vascular events because of evidence of pre-existing disease were included in the meta-analysis. Only those trials believed to have used a randomization method that precluded prior knowledge of the next treatment allocated and contained two randomized groups that differed only with respect to the antiplatet comparison of interest were selected. Furthermore, trials of oral antiplatet regimens were eligible only if they had assessed more than one day of treatment. An antiplatelet drug was defined as one whose primary effect on the vascular system inhibits platelet adhesion, platelet aggregation, or both. Details about the method of randomization, blinding of treatment allocation, scheduled duration of treatment, and, if, different,

scheduled duration of follow-up were requested of all trial coordinators.

The primary measure of outcome was a "serious vascular event" (i.e., non-fatal myocardial infarction, non-fatal stroke, or death from a vascular cause including deaths from an unknown cause). Deaths were divided into those with a vascular or non-vascular cause. Strokes were subdivided into intracranial hemorrhages (including intracerebral, subdural, subarachnoid, and extradural hemorrhages), ischemic strokes, and strokes of unknown etiology.

In addition to the meta-analysis from the Antithrombotic Trialists' Collaboration, the following trials relevant to antithrombotic therapy for noncardioembolic stroke were noted in the literature. The landmark trials primarily focused on aspirin and included: the International Stroke Trial Collaborative Group (1994); the Chinese Acute Stroke Trial Collaborative Group (1997); the European Stroke Prevention Study Group 2 (1997); the Canadian Cooperative Study Group (1978); the UK-TIA Study Group (1991); the Dutch TIA Study Group (1991); and the SALT Collaborative Group (1991). Three RCTs evaluated ticlopidine: the Canadian American Ticlopidine Study (1989), the Ticlopidine Aspirin Stroke Study (1989), and the African American Antiplatelet Stroke Prevention Study (2003). Clopidogrel was compared to aspirin alone in the Clopidogrel versus Aspirin in Patients at Risk of Ischemic Events (CAPRIE) trial (1996). The Management of Atherothrombosis with Clopidogrel in High-Risk Patients with Transient Ischemic Attacks or Ischemic Strokes (MATCH) trial (2004) evaluated the effectiveness of clopidogrel 75mg and aspirin 75 mg, compared with clopidogrel 75mg alone for stroke prevention. Clopidogrel for High Atherothrombotic Risk and Ischemic Stabilization, Management, and Avoidance (CHARISMA) trial (2006) and the Fast Assessment of Stroke and Transient ischemic attack to prevent Early Recurrence (FASTER) trial (2007) evaluated clopigogrel and aspirin in combination with aspirin alone. Four large RCTs evaluated the effectiveness of dipyridamole and aspirin among patients with stroke or transient ischemic attack: European Stroke Prevention Studies (ESPS-1 1987 and ESPS-2 1997); the European Australian Stroke Prevention in Reversible Ischemic Stroke (ESPRIT) trial (2006); and the Prevention Regimen for Effectively Avoiding Second Strokes (PRoFESS) trial (2008).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting antithrombotic therapy for secondary stroke prevention is high. Antithrombotic therapy post ischemic stroke is protective for high risk patients, such as, those with a history of prior stroke or vascular event. The body of evidence established by the Antithrombotic Trialists' Collaboration confirmed that prolonged antithrombotic therapy reduces the relative risk of stroke, myocardial infarction or death by approximately 22%. Risk of gastrointestinal hemorrhage or other major hemorrhage is the primary concern with ongoing therapy, although the studies have demonstrated that the risk is low and absolute benefits significantly outweigh the risks.

There was no appreciable evidence that either higher aspirin dose or any other antiplatelet regimen was more effective than low dose aspirin (75 mg to 150 mg) in preventing vascular events. Additionally, the body of evidence did not establish the optimal duration of treatment. The majority of studies reviewed lasted one to three years. The evidence seems to support that longer treatment might be more effective due to significant further benefit noted ($P<0.00001$) between year one and year three for most studies. Adding a second antithrombotic to aspirin may produce additional benefit; however, the evidence is inconclusive in this respect and more research recommended.

In reviewing the literature, there have been more studies conducted than included in the Antithombotic Trialists' meta-analysis. Some studies were not included in the meta-analysis due to the method of randomization chosen or small sample sizes. Antithrombotic medications other than aspirin have not been studied as extensively as aspirin.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that prolonged antithrombotic therapy reduces the risk of death in patients with a prior history of ischemic stroke. Based on these findings, antithrombotic therapy should be prescribed at discharge following acute ischemic stroke, unless there are contraindications to therapy.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence on the immediate hazards and net benefits of long-term antithrombotic therapy for the prevention of stroke recurrence. The Antithrombotic Trialists' Collaboration meta-analysis found a marginally significant ($P=0.04$) reduction in vascular mortality (7 deaths per 1,000 patients with a history of stroke or transient ischemic attack treated with antithrombotic therapy); however, the reduction in non-fatal vascular events and in all cause mortality was highly significant ($P=0.002$; 15 deaths per 1,000 patients

treated). These benefits exceeded the risk of bleeding (1-2 additional extracranial bleeds per 1,000 patients/year). On average, antithrombotic medications reduce the relative risk of stroke, MI, or death, but important differences exist between the various drugs in this category which directly impacts therapeutic selection.

Considering the cost of aspirin compared to the mean lifetime cost of ischemic stroke, estimated at $140,048 per person, antithrombotic therapy as a secondary stroke prevention strategy is clearly cost-effective. Gaspoz and colleagues (2002) concluded that the extension of aspirin therapy from the current levels of use to all eligible patients for 25 years would have an estimated cost-effectiveness ratio of about $11,000 per quality-adjusted year of life gained. The addition of clopidogrel for the 5 percent of patients who are ineligible for aspirin would cost about $31,000 per quality-adjusted year of life gained. Clopidogrel alone in all patients or in routine combination with aspirin had an incremental cost of more than $130,000 per quality-adjusted year of life gained and remained financially unattractive across a wide range of assumptions. However, clopidogrel alone or in combination with aspirin would cost less than $50,000 per quality-adjusted year of life gained if its price were reduced by 70 to 82 percent, to $1.00 and $0.60 per day, respectively.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of prolonged antithrombotic therapy post ischemic stroke is undisputed. No position against long-term antithrombotic therapy was noted in the literature. However, there is still not enough evidence to answer some questions. More randomized trials are needed to determine the optimal therapeutic agent(s) and regimen(s), as well as, the optimal duration of therapy.

1c.16 Quote verbatim, <u>the specific guideline recommendation</u> *(Including guideline # and/or page #)*:
2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 249.

Class I, Level of Evidence A

For patients with noncardioembolic ischemic stroke or TIA, the use of antiplatelet agents rather than oral anticoagulation is recommended to reduce the risk of recurrent stroke or another cardiovascular event.

Aspirin (50 mg/d to 325 mg/d) monotherapy (Class I, Level of Evidence A), the combination of aspirn 25 mg and extended-release dipyridamole 200 mg twice daily (Class I, Level of Evidence B), and clopidogrel 75 mg monotherapy daily (Class IIa, Level of Evidence B), are all acceptable options for initial therapy. The selection of an antiplatelet agent should be individualized on the basis of patient risk factor profiles, cost, tolerance, and other clinical characteristics.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on July 13, 20010. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence

from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0435_Evidence_MSF5.0_Data-635827722515582215.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. Studies have shown that antithrombotic therapy prescribed at discharge following acute ischemic stroke reduces stroke mortality and morbidity.

Healthcare organizations that track antithrombotic therapy prescribed at discharge for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to which will also promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
The use of antithrombotic therapy after ischemic stroke is recommended for secondary stroke prevention. Earlier evidence supported substantial underutilization of this therapy, particularly among the very elderly, those admitted from skilled nursing facilities, and patients with functional dependence (Lichtman JH, 2011). An analysis of Medicare data for 31,554 non-terminally ill patients with ischemic stroke randomly selected from the Medicare Health Care Quality Improvement Program's National Stroke Project (1998 to 1999, 2000 to 2001) demonstrated that only 74.2% were discharged on an antithrombotic medication. Treatment rates decreased with age and were lowest for patients' age 85-years and older. Later data demonstrates that this previous performance gap of 25% has narrowed significantly.

In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-2 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 2034 denominator cases; 1995 numerator cases; 49 hospitals; 0.98083 national aggregate rate; 0.98731 mean of hospital rates; 0.2575 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.98601 25th percentile rate/lower quartile; and, 0.94737 10th percentile rate.

CY 2010: 19,889 denominator cases; 19,622 numerator cases; 137 hospitals; 0.98658 national aggregate rate; 0.97644 mean of hospital rates; 0.05765 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99711 50th percentile rate/median rate; 0.98276 25th percentile rate/lower quartile; and, 0.93436 10th percentile rate.

CY 2011: 24,053 denominator cases; 23,812 numerator cases; 157 hospitals; 0.98998 national aggregate rate; 0.97173 mean of hospital rates; 0.10346 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99803 50th percentile rate/median rate; 0.98529 25th percentile rate/lower quartile; and, 0.94915 10th percentile rate.

CY 2012: 24,420 denominator cases; 24,217 numerator cases; 158 hospitals; 0.99169 national aggregate rate; 0.98674 mean of hospital rates; 0.04061 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.98913 25th percentile rate/lower quartile; and, 0.97059 10th percentile rate.

CY 2013: 37,661 denominator cases; 37.363 numerator cases; 262 hospitals; 0.99209 national aggregate rate; 0.9885 mean of hospital rates; 0.02736 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile

rate/median rate; 0.98913 25th percentile rate/lower quartile; and, 0.96667 10th percentile rate.

CY 2014: 180,048 denominator cases; 178,945 numerator cases; 1299 hospitals; 0.99387 national aggregate rate; 0.98632 mean of hospital rates; 0.06957 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.99254 25th percentile rate/lower quartile; and, 0.97674 10th percentile rate.

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al., 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates

in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Potential disparities in secondary pharmacological prevention for recurrent stroke have been identified. A study using the uniform data system for medical rehabilitation data from nursing homes in five states found that blacks or African Americans were significantly less likely to receive antithrombotic therapy (Ottenbacher KJ, et al, 2001). In a model adjusting for age, sex, physical function, and comorbidities, blacks or African Americans proved to be 80% as likely as whites to receive antithrombotic therapy.

Based on a national cross-sectional study of nursing home residents, the use of any antithrombotic (anticoagulant or antiplatelet) therapy was lower for Hispanics (45.5%), non-Hispanic blacks (49.4%), and Asian/Pacific Islanders (38.9%) than for whites (54.3%), although higher among a subsample of Native Americans (58.0%). Aspirin use was comparable across ethnic groups, and actually higher for Native American, blacks or African Americans, and Hispanic than for whites. In contrast, oral anticoagulation (warfarin) use was significantly lower for ethnic minority groups (25.4%-31.7%), except Native Americans whose proportion was only slightly lower (36.4%) than whites (39.6%)(Christian JB, et al. 2003).

Since the last endorsement date, Schwamm and colleagues (2010) found significant and important differences in quality of care related to antithrombotics at discharge when multivariate models were constructed adjusting for patient-level characteristics only. Race/ethnicity Black versus White: unadjusted OR 0.86 [95% CI 0.83-0.90]; adjusted for patient characteristics OR 0.81 [95% CI 0.78-0.85]; adjusted for patient and hospital characteristics OR 0.88 [95% CI 0.84-0.92]. Race/ethnicity Hispanic versus White: unadjusted OR 0.85 [95% CI 0.75-0.90]; adjusted for patient characteristics OR 0.80 [95% CI 0.75-0.86]; adjusted for patient and hospital characteristics OR 0.90 [95% CI 0.82-0.97]. Total N=46,515; All n 94.98%; White 95.15%; Black 94.41%; Hispanic 94.31%.

A more recently published study (Qian F, et al, 2013) from Get With The Guidelines (GWTG) also noted racial and ethnic disparities for antithrombotics at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association GWTG-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for discharged antithrombotic: non-Hispanic White (n=170,694) 95.3%; non-Hispanic Black (n=20,514) 94.3%; Hispanic (n=6632) 94.5%; and non-Hispanic Asian American (n=3060) 94.5%. Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) were similar for antithrombotic therapy at discharge (n=58,823) White 98.4%; Other Race 98.3% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$) (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke,

˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Antithrombotic agents significantly reduce the incidence of a recurrent vascular event after a stroke. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials (Kernan WN, et al, 2014; Sandercock P, et al, 2014)). While the use of these agents for patients with acute ischemic stroke and transient ischemic attacks continues to be the subject of study, substantial evidence is available from completed studies. Data at this time suggest that antithrombotic therapy should be prescribed at discharge following acute ischemic stroke to reduce stroke mortality and morbidity as long as no contraindications exist.

1c.5. If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful. *(Describe how and from whom their input was obtained.)*

Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK2_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** DischargedonAntithromboticThe_v4_Mon_Apr_06_11.08.32_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Patients prescribed antithrombotic therapy at hospital discharge.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Antithrombotic Therapy Prescribed at Discharge

- Antithrombotic Therapy is represented with the QDM datatype and value set of Medication, Discharge: Antithrombotic Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.201)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.7. Denominator Statement *(Brief, narrative description of the target population being measured)*
Patients with a principal diagnosis of ischemic stroke.

S.8. Target Population Category *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. Denominator Details *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke

- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. Denominator Exclusions *(Brief narrative description of exclusions from the target population)*
Denominator Exclusions:
Patients with comfort measures documented.
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care

Denominator Exceptions:
Patients with a documented reason for not prescribing antithrombotic therapy at discharge.

S.11. Denominator Exclusion Details *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Denominator Exclusion Data Elements:

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Discharge Status (modeled as Attributes of the above Non-Elective Inpatient Encounter)

- Discharge status: Left Against Medical Advice (OID: 2.16.840.1.113883.3.117.1.7.1.308)
- Discharge status: Patient Expired (OID: 2.16.840.1.113883.3.117.1.7.1.309)
- Discharge status: Discharge To Acute Care Facility (OID: 2.16.840.1.113883.3.117.1.7.1.87)
- Discharge status: Discharged to Home for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.209)
- Discharge status: Discharged to Health Care Facility for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.207)

Comfort Measures

- Comfort Measures are represented with the QDM datatypes and value set of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Denominator Exceptions Data Elements:

Reasons for Not Ordering Antithrombotic Medication
- Antithrombotic Ingredient Specific Medication is represented with the QDM datatype and value set of Medication, Discharge: Antithrombotic ingredient specific (OID: 2.16.840.1.113762.1.4.1021.8)
- Medical Reason is represented with the QDM datatype and value set of Medication, Discharge not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
- Patient Refusal is represented with the QDM datatype and value set of Medication, Discharge not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. **Type of score:**
Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0435_CMS104v4_STK2_Bonnie_Testing.xlsx,STK2_eCQM_testing_attachment-635907892750810521.docx

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** 2832
Measure Title: STK02: Discharged on Antithrombotic Therapy
Date of Submission: 1/14/2016
Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of

sufficient frequency of occurrence so that results are distorted without the exclusion; [12]

AND

If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR

- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful [16] differences in performance**;

OR

there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes

10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).

11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.

12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.

13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.

14. Risk factors that influence outcomes should not be specified as exclusions

15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE

Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure. Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**
☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for <u>all</u> the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: **(*must be consistent with levels entered in item S.26*)**	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which <u>measured entities</u> were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which <u>patients</u> were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

22 unique synthetic patient records were created in the BONNIE testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and medications were pre-determined to provide a variety of scenarios that adequately test patients passing each data element and failing each data element. Data included in cases and tested for this measure included diagnoses, medications, discharge statuses, patient orders, age, length of stay, and ED and inpatient encounters.

All 22 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

***Note**: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)

☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #0435 STK02: Discharged on Antithrombotic Therapy, from which this measure is derived.

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 97.61%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-2.

Data Elements	Total 'n' numerator	Total 'n' denominator	Rate
Antithrombotic Therapy Prescribed at Discharge	442	460	96.1%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
Reason for Not Prescribing Antithrombotic Therapy at Discharge	10	11	91.0%

These agreement rates are considered to be well within acceptable levels.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

- ☒ **Critical data elements** (*data element validity must address ALL critical data elements*)
- ☒ **Performance measure score**
  - ☐ **Empirical validity testing**
  - ☒ **Systematic assessment of face validity of <u>performance measure score</u> as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic stroke appropriately fall into the measure. We have created negative test cases, testing to ensure patients with a different principal diagnosis do not actually make it into the denominator.

Numerator test cases positively test to ensure patients receiving antithrombotic therapy at discharge pass the measure. Negative test cases ensure that a patient who does not receive antithrombotic therapy in the specified time frame do not pass the measure.

Denominator exclusion and exception test cases for this measure ensure that patients are properly removed from the denominator if they have comfort measures, specific discharge statuses other than discharged home, and medical reasons or patient refusal for not getting antithrombotic therapy. Negative test cases are also run, an example of this would be comfort measures that are ordered but not in the specified time frame. Testing confirmed patients meeting the exclusion and exception criteria are removed from the measure appropriately.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

_____

2b3. EXCLUSIONS ANALYSIS

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with Comfort Measures
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are detailed below.

Exclusion: Comfort Measures Only
Overall Occurrence n = 163,225
Overall Occurrence Percentage: 10.4%
Minimum: 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge
Overall Occurrence n = 19,751
Overall Occurrence Percentage: 6.27%
Minimum: 0.27%

10th Percentile 0.92%
Median: 2.82%
90th Percentile: 16.1%
Maximum: 60.6%

Exclusion: Discharge Disposition - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage: 35.7%
Minimum: 0.787%
10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: Discharge Disposition - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage: 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: Discharge Disposition - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage: 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: Discharge Disposition - Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage: 52.2%
Minimum: 6.25%
10th Percentile: 39%
Median: 51.9%
90th Percentile: 64%
Maximum: 94.3%

Exclusion: Discharge Disposition - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage: 3%
Minimum: 0.169%
10th Percentile: 0.87%
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-asbtracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i.*e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE

2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0435: STK-2 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	154	0.98351	0.07256	1	1	1	1	0.97674
2Q2011	155	0.97524	0.11930	1	1	1	1	0.96491
1Q2011	160	0.97249	0.10725	1	1	1	0.98833	0.94495
4Q2010	135	0.98048	0.06361	1	1	1	1	0.94286
3Q2010	130	0.96843	0.11476	1	1	1	0.98889	0.94291
2Q2010	122	0.97233	0.08071	1	1	1	0.97959	0.94203
1Q2010	99	0.97384	0.06745	1	1	1	0.97959	0.91667
4Q2009	49	0.98731	0.02575	1	1	1	0.98601	0.94737

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across

measured entities? (i.*e.*, *what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS

If only one set of specifications, this section can be skipped.

Note: *This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i.*e.*, *what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual performance (whether or not the case fails) is compared to expectations to ensure missing

data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score)

If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment **Attachment:** STK2_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

Not applicable.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://jointcommission.org EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentivepr

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

- Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
- Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

- Name of program and sponsor Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)

Not applicable.

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures

Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
0435 : STK 02: Discharged on Antithrombotic Therapy

0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0438 Antithrombotic Therapy By End of Hospital Day 2 is the fifth (STK-5) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in this measure than STK-2. STK-5 focuses on the early management of stroke care and antithrombotic therapy administered within the first 48 hours of acute ischemic stroke onset rather than discharge. All common data elements for these measures are completely harmonized. NQF#0435: STK 02: Discharged on Antithrombotic Therapy: The measures are completely harmonized to the extent possible, given the fact that the data source for #0435 is the paper medical record, and the data source for #2832 is the electronic health record. Measure 0068 is a physician performance measure and could extend to the outpatient setting. Measure 0068 encompasses a different target population, specifically patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI). As previously noted, both of these measures evaluate physician practice as opposed to hospital processes.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not applicable.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

To navigate the links in the worksheet: Ctrl + click link to go to the link; ALT + LEFT ARROW to return

Brief Measure Information

NQF #: 2833
Measure Title: STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients with atrial fibrillation/flutter who are prescribed anticoagulation therapy at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. STK-3, Anticoagulation Therapy for Atrial Fibrillation/Flutter, is one of six of the measures in this set that have been reengineered as eCQMs and are included in the EHR Incentive Program and Hospital Inpatient Quality Reporting Program.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Stroke risk is significantly increased for patients with a history of or current finding of atrial fibrillation/flutter. Antiplatelet medications alone do not significantly reduce stroke risk for this patient population. Anticoagulation through the administration of warfarin, low molecular-weight heparins, or newer anticoagulant medications approved for stroke prevention is the recommended therapy.

Multiple clinical trials have demonstrated the superior therapeutic effect of warfarin compared with placebo in the prevention of thromboembolic events among patients with nonvalvular atrial fibrillation. Based on data pooled from 5 primary prevention trials of warfarin versus control, it is possible to reduce the annual stroke rate from 4.5% for the control patients to 1.4% in patients treated with dose-adjusted warfarin. In other words, 31 ischemic strokes can be prevented each year for every 1,000 patients treated (Sacco RL, et al., 2006).

Healthcare organizations that track anticoagulation therapy for internal quality improvement purposes have seen a significant increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Patients prescribed anticoagulation therapy at hospital discharge.
Denominator Statement: Patients with a principal diagnosis of ischemic stroke, history of atrial ablation, and current or history of atrial fibrillation/flutter.
Denominator Exclusions: Denominator Exclusions:

- Patients with comfort measures documented.
- Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
- Patients discharged to another hospital.
- Patients who left against medical advice.
- Patients who expired.

- Patients discharged to home for hospice care.
- Patients discharged to a health care facility for hospice care.

Denominator Exceptions:
- Patients with a documented reason for not prescribing anticoagulation therapy at discharge.

Measure Type: Process

Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Most Recent Endorsement Date:

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary:

Evidence for this new eMeasure is the same as the existing measure #0436 STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter:

- The body of evidence consistently supports that the administration of anticoagulation therapy, unless there are contraindications, is an established and effective strategy in preventing recurrent stroke in high stroke risk atrial fibrillation patients with TIA or prior stroke.
- Class I, Level of Evidence A – 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 243
  - For patients with ischemic stroke or TIA with paroxysmal (intermittent) or permanent AF, anticoagulation with a vitamin K antagonist (target INR, 2.5; range 2.0 to 3.0) is recommended.
  - The Committee noted that the medical evidence to support anticoagulation therapy is not controversial;
  - however, there are some questions around the evidence for the timing of anticoagulant therapy.
- The 2012 Committee that reviewed the chart-abstracted version of this measure noted that the medical evidence to support anticoagulation therapy is not controversial; however, there are some questions around the evidence for the timing of anticoagulant therapy.

Questions for the Committee:
- *The developer attests the underlying evidence for the measure #0436 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure, therefore there is no need for repeat discussion and voting on Evidence?*

Guidance from the Evidence Algorithm: Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency: high(Box 5) → Box 5a High

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**
Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
    - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of data on 4 of 28 available eCQMs. This measure is 1 of the 28 eCQMs.
- The developer also provided performance data from the chart abstracted measure which seems to be very high with little room for improvement.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

1a. Evidence to Support Measure Focus

Comments: **Process measure. relates indirectly to the outcome of reduced stroke and/or death (desired outcome). High quality data supports a link between institution of anticoagulation therapy for patients with atrial fibrillation and reduced stroke risks.

New data pertains more to adherence to anticoagulants, not institution (would not be captured with this measure) eg Yao, Xiaoxi, et al. "Effect of adherence to oral anticoagulants on risk of stroke and major bleeding among patients with atrial fibrillation." Journal of the American Heart Association 5.2 (2016): e003074.

**Evidence supportive

**No change of evidence - no vote needed. There is room for much more evidence as it relates to disparities.

1b. Performance Gap

Comments: **Performance data included in measure worksheet showing limited gap in overall performance on this measure. note is made of potential racial/ethnic disparities but limited data available.

**No performance data for emeasure

**No data for e version. There is encouraging reason to believe that the adoption of this measure might shed light on performance gaps in populations with disparities.

1c. High Priority (previously referred to as High Impact)

Comments: **NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart abstracted measure from which this measure is derived.

Questions for the Committee :

- o *Are all the data elements clearly defined? Are all appropriate codes included?*
- o *Is the logic or calculation algorithm clear?*
- o *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.

2a2. Reliability Testing Testing attachment

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 22 synthetic records created in the Bonnie testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Guidance from the Reliability Algorithm: Precise specifications (Box 1) →empiric reliability testing as specified (Box 2) → empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→ Assessed the measure logic only (Box 11) →Low certainty or confidence data used in measure are valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**
☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 22 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.
- The numerator, denominator, exclusions/exceptions , and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of the exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little room for improvement?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box 2) →empirical testing of data elements using BONNIE tool (Box 3,10) → Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **Low inconsistency. Target population would find reducing stroke risk and or death meaningful as long as other risks do not outweigh this (for example, major bleeding episodes)

**No concerns

**This is the e version of the existing chart measure. All appropriate data appear to be there.

2a2. Reliability Testing

Comments: **Yes. large scale validity testing 1318 hospitals and 2206379 patients. Strong Pearson correlations with 6 other measures of stroke performance.

**small sample tested; too preliminary to generalize

**22 synthetic records submitted to Bonnie test, Results are positive. Sample size is small. Implementation should allow for more detailed review - especially with regard to varied populations.

2b2. Validity Testing

Comments: **The data does not pose a threat to validity for this measure. Patients discharged to hospice or having comfort measures are usually not candidates for anticoagulation due to limited nature of active medical treatment in such population. Possible risk would be patients with dementia referred to hospice for services but for whom survival duration may be indefinite, and for home potential benefits of anticoagulation exist.
**numerous threats to validity
**Exclusions appear appropriate. Missing data is uncertain. Since this is a part of meaningful use it is likely that missing data will be minimal and thus no threats to validity.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **Reliability tested in 77 hospital and 739 patients. appears sufficient.
Demonstrated inter rater reliability of 98.1% overall.
**Low reliability testing
**22 synthetic records submitted to Bonnie test. Results are good. There is a minor concern that these results are a rather small sample. Implementation should allow for much more detailed review of reliability.

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow, or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Concern is that chart review extraction is time consuming and costly for health systems or health practitioners. This kind of data is not easily obtained from EMR unless specific templates allowing data extraction are used.
**Acceptable
**Data should all be in the EHR. Accuracy and completeness of data entry is uncertain. As with all measures there is some question

as to whether the time involved in data entry and extraction for review will add value beyond what would happen without this measure.

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure
Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Noted reported in a number of public registries, websites.
since performance gap overall is low, utility for this measure would be highest in low performing systems or in populations where gap remains (example given is non-hispanic Black women.

**No performance data provided so use/usability unknown

**Part of the meaningful use accountability program. Data available and usable. Benefits to treatment are without question. Benefits of the implementation of the measure are uncertain - cost/benefit.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0436 : STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter
- 1525 : Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

- 0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation – AMA-PCPI – no longer NQF endorsed
- 0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge – AAN – no longer endorsed
- 0624 : Atrial Fibrillation - Anticoagulation Therapy – ActiveHealth Management – not NQF endorsed

Harmonization:

- The target population for measure #1525 differs from measure 0436 Anticoagulation Therapy for Atrial Fibrillation/Flutter in that it includes in the denominator population all patients age 18 years and older with a diagnosis of nonvalvular atrial fibrillation or atrial flutter whose assessment of the specified thromboembolic risk factors indicate one or more high-risk factors or more than one moderate risk factor, as determined by CHADS2 risk stratification. It is not specified for ischemic stroke patients with atrial fibrillation/flutter only.
- #0436 and #2833 are completely harmonized to the extent possible, given the fact that the data source for #0436 is the paper medical record, and the data source for #2833 is the electronic health record.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0436 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent a secondary stroke attributable to a thromboembolic event resulting from atrial fibrillation following a new ischemic stroke.
Anticoagulation therapy prescribed at discharge >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for prevention of stroke in patients with ischemic stroke or transient ischemic attack. Both persistent atrial fibrillation and paroxysmal atrial fibrillation are potent predictors of first and recurrent stroke. Data from clinical trials show that age, recent congestive heart failure, hypertension, diabetes, and prior thromboembolism have been found to identify high-risk groups for atrial thromboembolism among patients with atrial fibrillation. Left ventricular dysfunction, left atrial size, mitral annular calcification (MAC), spontaneous echo contrast, and left atrial thrombus by echocardiography have also been shown to predict increased thromboemoblic risk. Overall, patients with prior stroke carry the highest stroke risk (RR, 2.5) (Sacco RL, et al., 2006).

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: Between 1990 and 2006, a total of 24 randomized trials (RCTs) involving patients with non-valvular atrial fibrillation were published. Collectively, these RCTs represent 20,012 participants with an average follow-up of 1.6 years, and a total exposure of about 32,800 patient-years (Fuster V, et al., 2006).

A meta-analysis of six randomized trials (Hart RG, et al.1999) conducted between 1989 and 1993 showed that adjusted dose-warfarin is highly efficacious for prevention of all stroke (both ischemic and hemorrhagic), with a risk reduction of 61% (95% CI 47% to 71%) versus placebo. The duration of follow-up was generally between 1 and 2 years; the longest was, 2.2 years. Five of the six RCTs, focused on primary prevention of thromboembolism in patients with nonvavlular atrial fibrillation, (i.e., The Copenhagen AFASAK Study (AFSAK); Stroke Prevention in Atrial Fibrillation (SPAF I); The Boston Area Anticoagulation Trial for Atrial Fibrillation (BAATAF); the Canadian Atrial Fibrillation Anticoagulation (CAFA) Study; and, the Veteran Administration Stroke Prevention in Non-Rheumatic Atrial Fibrillation (VA-SPINAF). One trial, the European Atrial Fibrillation Trial (EAFT), specifically studied secondary prevention among patients who had survived nondisabling stroke or cerebral transient ischemic attack (TIA). Findings from primary prevention studies were extrapolated and applied to secondary prevention.

A Cochrane review of anticoagulants for preventing stroke in patients with nonrheumatic atrial fibrillation and a history of stroke or transient ischemic attack published in The Cochrane Library 2011, Issue 4, focused specifically on two of the above RCTs: EAFT and the VA-SPINAF. The search strategy employed the Cochrane Stroke Group Trials Register (June 9, 2003), and contacted

researchers in the field to identify any further published or non-published studies. Selection criteria involved randomized trials comparing oral anticoagulants with control (no therapy) or placebo in people with NRAF and a previous TIA or minor ischemic stroke. Control groups on aspirin did not meet search criteria. These two trials involved 485 participants. Although VA-SPINAF was a primary prevention study, a small proportion of patients had suffered a previous stroke or TIA and the results for these patients were reported separately. The review considered the following main outcomes: fatal or non-fatal (disabling or non-disabling) recurrent stroke; all major vascular events: vascular death (including fatal bleeds), recurrent stroke (both ischemic and hemorrhagic), myocardial infarction, and systemic embolism; any intracranial bleed; and, major extracranial bleed defined as severe enough to lead to hospital admission, blood transfusion, or surgery (Saxena R, Koudstaal PJ, 2011).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting anticoagulation for stroke prevention in patients with NRAF is high. The Cochrane Review of EAFT and VA-SPINAF determined that in patients with NRAF and a recent TIA or minor ischemic stroke, oral anticoagulation therapy almost halves the odds of serious vascular event. The odds of recurrent stroke, disabling as well as non-disabling, is decreased by two-thirds. In the EAFT group of patients without contraindications to anticoagulants, the annual rate of all vascular events was 8% in patients assigned to anticoagulants (n=225) versus 17% in patients assigned to placebo (n=214). The risk of stroke was reduced from 12% to 4% per year. In other words, 90 vascular events (mainly strokes) were prevented per 1000 patients treated with anticoagulants per year. The incidences of bleeding events (major or minor, intracranial or extracranial) on anticoagulation was low (2.8% per year versus 0.7% per year in the placebo group). In the VA-SPINAF study, four patients in the placebo group (n=25) compared to two in the anticoagulant group (n=21) suffered a recurrent stroke. The number of all vascular events was 8/21 in the warfarin group versus 11/25 in the placebo group (OR 0.78, 95% CI 0.20 to 2.9). No intracranial bleeds occurred. The recurrence of stroke of 9.3% per year in the placebo group, and the odds reduction by anticoagulant therapy, were very similar to those found in the EAFT.

The results of secondary prevention studies are highly similar to those of the five primary prevention studies of NRAF patients who did not have an ischemic stroke or TIA (n=4052). The most important difference between the primary and secondary prevention studies is the much higher incidence of recurrent stroke. The secondary prevention studies observed an annual incidence of 12% in the placebo group, which is nearly three times as much as in the placebo treated groups of the primary prevention studies (4.5% per year). This makes the value of anticoagulation for secondary prevention even more impressive in absolute terms: 90 vascular events (mainly strokes) are prevented if 1000 patients are treated for one year. Compared with aspirin, oral anticoagulants significantly decrease the risk of all strokes, ischemic strokes, and cardiovascular events with only a modest increase in bleeding risk. According to Van Walraven (2002), stroke risk for patients treated with aspirin alone was 10% per year for patients with a prior history of stroke and 2.7% for those with no such history versus 4% and 1.5% respectively for patients receiving anticoagulation therapy.

The Cochrane reviewers identified several flaws in EAFT. First, anticoagulant treatment was not blinded. Second, the results of the five primary prevention trials were published while EAFT was in progress. This could have biased both EAFT Auditing Committee and the individual investigators. Hospital admission for a major extracranial bleed might have been more likely for patients on an anticoagulant. However, all members of the Audit Committee who assessed the outcomes were absolutely blinded for the assigned study treatment. Finally, the majority of recurrent vascular events in EAFT were major, which left little room for inter-observer variation.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that the administration of anticoagulation therapy, unless there are contraindications, is an established and effective strategy in preventing recurrent stroke in high stroke risk atrial fibrillation patients with TIA or prior stroke.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence that oral anticoagulants are beneficial and safe for preventing a second stroke in people with atrial fibrillation and prior stroke. The literature examined reveals that patients with NRAF and a recent TIA or minor ischemic stroke who are prescribed oral anticoagulation therapy have a 50% decrease in the odds of a second serious vascular event. The odds of recurrent stroke, disabling as well as non-disabling, is also decreased by two-thirds. Patients with atrial fibrillation have an irregular heart beat and, if not properly anticoagulated, this can cause the formation of a blood clot in the left atrium of the heart. This clot may break away and block a cerebral artery causing a stroke. Patients who have had a stroke in the presence of NRAF have a high risk of another stroke. Anticoagulant drugs, such as warfarin, make the blood thinner and prevent formation of blood clots and hence could prevent stroke. However, anticoagulant drugs may also cause bleeding in the brain and this complication could offset any benefits.

However, examination of the literature reveals that many studies do not provide information on the balance between risk and benefit of anticoagulation therapy in the early period after stroke onset in patients with atrial fibrillation. Several studies have recommended withholding anticoagulants during the first few days post stroke, especially in cases of large infarcts. In one trial involving 449 patients with ischemic stroke and atrial fibrillation, a low-molecular-weight heparin did not reduce recurrent stroke risk during the first 14 days (Berge, et al, 2000). Another large trial of similar patients (N=3169) receiving subcutaneous unfractionated heparin, the risk of recurrent ischemic stroke within the first 14 days was reduced by 50%; however, an increase in spontaneous intracerebral hemorrhage offset the benefit
(Saxena, et al., 2001). Conclusions from these studies continue to recommend oral anticoagulation treatment as secondary prevention for those patients' who have no contraindication.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: There is some uncertainty as to when anticoagulation therapy should be initiated for patients with atrial fibrillation following a stroke. As noted above, one study found an increased risk of intracerebral hemorrhage when anticoagulant therapy was initiated within the first 14 days post stroke; however, it is generally recommended that anticoagulation therapy be initiated within the first one to two weeks. Although the absolute benefits of anticoagulation are higher in secondary prevention, it remains undisputed that the risk of stroke warrants the use of warfarin in all patients with atrial fibrillation, unless contraindicated. The benefit of unfractionated and low molecular-weight heparins over warfarin, as well as target INR value, is somewhat controversial.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0436_Evidence_MSF5.0_Data-635827722551306673.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Stroke risk is significantly increased for patients with a history of or current finding of atrial fibrillation/flutter. Antiplatelet medications alone do not significantly reduce stroke risk for this patient population. Anticoagulation through the administration of warfarin, low molecular-weight heparins, or newer anticoagulant medications approved for stroke prevention is the recommended therapy.

Multiple clinical trials have demonstrated the superior therapeutic effect of warfarin compared with placebo in the prevention of thromboembolic events among patients with nonvalvular atrial fibrillation. Based on data pooled from 5 primary prevention trials of warfarin versus control, it is possible to reduce the annual stroke rate from 4.5% for the control patients to 1.4% in patients treated with dose-adjusted warfarin. In other words, 31 ischemic strokes can be prevented each year for every 1,000 patients treated (Sacco RL, et al., 2006).

Healthcare organizations that track anticoagulation therapy for internal quality improvement purposes have seen a significant increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-3 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 325 denominator cases; 303 numerator cases; 43 hospitals; 0.93231 national aggregate rate; 0.90522 mean of hospital rates; 0.22409 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.875 25th percentile rate/lower quartile; and, 0.8 10th percentile rate.

CY 2010: 2952 denominator cases; 2785 numerator cases; 136 hospitals; 0.94343 national aggregate rate; 0.92168 mean of hospital

rates; 0.13488 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.90767 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2011: 3566 denominator cases; 3381 numerator cases; 150 hospitals; 0.94812 national aggregate rate; 0.92886 mean of hospital rates; 0.13698 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.90625 25th percentile rate/lower quartile; and, 0.7735 10th percentile rate.

CY 2012: 3685 denominator cases; 3530 numerator cases; 149 hospitals; 0.95794 national aggregate rate; 0.94795 mean of hospital rates; 0.11113 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.95522 25th percentile rate/lower quartile; and, 0.83333 10th percentile rate.

CY 2013: 5635 denominator cases; 5429 numerator cases; 257 hospitals; 0.96344 national aggregate rate; 0.95363 mean of hospital rates; 0.1165 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.95349 25th percentile rate/lower quartile; and, 0.88235 10th percentile rate.

CY 2014: 28,027 denominator cases; 27,261 numerator cases; 1256 hospitals; 0.97267 national aggregate rate; 0.96598 mean of hospital rates; 0.08548 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.96429 25th percentile rate/lower quartile; and, 0.88889 10th percentile rate.

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al., 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance

and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).
Although blacks and African Americans have a lower incidence of atrial fibrillation than Non-Hispanic whites (Hajat, et al. 2001), blacks and African Americans are also less likely to undergo cardiac monitoring and noninvasive cerebrovascular testing (Mitchell, et al., 2000). In REGARDS, investigators found that blacks or African Americans were less likely to be aware that they had atrial fibrillation or to be treated with warfarin.

Furthermore, minorities are less likely to receive medications for secondary prevention. One report suggests that blacks or African Americans are less likely to have thorough diagnostic evaluation after first stroke and are less likely to receive guideline-concordant stroke preventive medications, such as warfarin or other anticoagulants. In another study which used the 2005 Behavioral Risk Factor Surveillance System (BRFSS) in 11, 862 stroke survivors, little difference was found among blacks or African Americans and non-Hispanic whites in terms of secondary prevention measures. The study found that secondary prevention measures were underutilized in both racial groups.

Studies have also noted a relationship between health literacy, particularly math skills and medication compliance. A study from Estrada and colleagues (2004), found that anticoagulation control was poorer for participants with lower literacy levels. The international normalized ratio (INR) was 32% higher for participants in the lowest literacy group versus the highest (P+0.009). Other studies have found no association between literacy and the proportion of time with the INR in the therapeutic range (OR 1.0, 95% CI 0.7 to 1.4); however, no genetic factors influencing response to anticoagulation were included in the analysis (Fang MC, et al., 2006).

Since the last endorsement date, Schwamm and colleagues (2010) reported that black patients had significantly lower adjusted odds compared with white patients of receiving anticoagulation for atrial fibrillation (OR, 0.84; 95% CI, 0.75 to 0.94). Findings from Qian and associates (2013) agreed that non-Hispanic black patients were less likely to receive anticoagulation for atrial fibrillation at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, Qian reported the following performance measure rates for discharged on anticoagulation for atrial fibrillation: non-Hispanic White (n=170,694) 90.0%; non-Hispanic Black (n=20,514) 88.3%; Hispanic (n=6632) 89.0%; and non-Hispanic Asian American (n=3060) 90.3%. According to data from the Paul Coverdell National Acute Stroke Registry (PCNASR) (n=9358), patients who are not white are less likely to receive anticoagulation therapy for atrial fibrillation; White 96.2%; Other Race 94.0% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

White women with atrial fibrillation, as well as women of other races with atrial fibrillation, are slightly less likely to receive anticoagulation therapy than men (88% versus 89.7%; adjusted OR, 0.93; 95% CI, 0.88–0.98) (Bushnell, 2014). The attributable risk of stroke from atrial fibrillation increases with age, from 1.5% for those aged 50 to 59 years to nearly 25% for those aged =80 years. Whites carry the highest prevalence of atrial fibrillation compared with blacks, Hispanics, Asians, and other ethnic groups. The overall number of men and women with atrial fibrillation is similar, but ˜60% of atrial fibrillation patients aged >75 years are women

(15.6% of men and 20.4% of women (P<0.0001).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. **Demonstrated high priority aspect of healthcare**
Affects large numbers, A leading cause of morbidity/mortality
1c.2. **If Other:**

1c.3. **Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.**
Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States is still attributable to stroke.. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths in 2008 (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$) (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Approximately 20% of ischemic strokes result from a cerebral embolism secondary to a cardiac arrhythmia or disorder. Atrial fibrillation (AF) is the most common sustained cardiac rhythm disturbance (CDC, 2010). Paroxysmal, persistent, and permanent atrial fibrillation are strong predictors of first and recurrent stroke, increasing ischemic stroke risk four to five-fold. It is estimated that over 2.3 million Americans have atrial fibrillation, and the incidence becomes more prevalent with age. AF accounts for ˜ 1.5% of stroke in individuals 50 to 59 years of age to nearly 25% in those aged > 80 years (Bushnell C, et al., 2014).

Patients who have suffered an ischemic stroke who have a high-risk source of cardiogenic embolism should generally be treated with anticoagulant drugs to prevent reoccurrence. For most patients with ischemic stroke and atrial fibrillation, it is reasonable to initiate anticoagulation therapy within 14 days of stroke onset (Kernan WN, eta l, 2014). Warfarin, dabigatran, and apixaban are all indicate for the prevention of recurrent stroke in patients with nonvalvular atrial fibrillation, whether paroxysmal or permanent. Rivaroxaban is a reasonable alternative (Kernan WN, 2014). Ischemic stroke rates per 1000 patient-years declined in AF patients taking anticoagulants, from 46.7% in 1992 to 19.1% in 2002 (AHA 2012). According to the Framingham Study (1996), AF is also an independent risk factor for ischemic stroke severity, recurrence, and mortality (Lin HJ, et al., 1996). In a study from Penado and associates (2003), people who had AF and were not treated with anticoagulants had a 2.1-fold increase in risk for recurrent stroke and a 2.4-fold increase in risk for recurrent severe stroke.

In addition to the costs attributed to stroke, the treatment of atrial fibrillation alone represents a significant health care burden. The estimated cost of treatment of atrial fibrillation in 2005 was $6.65 billion per year, including the costs of hospitalization, inpatient and outpatient physician care, and medications (Roger VL, et al.,2012).

1c.5. If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful. *(Describe how and from whom their input was obtained.)*

Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK3_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** STK3Stroke_v5_Wed_Apr_01_12.13.27_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Patients prescribed anticoagulation therapy at hospital discharge.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Anticoagulation Therapy Prescribed at Discharge
- Anticoagulant Therapy is represented with the QDM datatype and value set of Medication, Discharge: Anticoagulant Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.200)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.7. Denominator Statement *(Brief, narrative description of the target population being measured)*
Patients with a principal diagnosis of ischemic stroke, history of atrial ablation, and current or history of atrial fibrillation/flutter.

S.8. Target Population Category *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. Denominator Details *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke

- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

History of Atrial Ablation

- Atrial Ablation is represented with the QDM datatype and value set of Procedure, Performed: Atrial Ablation (OID: 2.16.840.1.113883.3.117.1.7.1.203)

Current or Historical Diagnosis of Atrial Fibrillation/Flutter

- Current Diagnosis of Atrial Fibrillation/Flutter is represented with the QDM datatype and value set of Diagnosis, Active: Atrial Fibrillation/Flutter (OID: 2.16.840.1.113883.3.117.1.7.1.202)
- Historical Diagnosis of Atrial Fibrillation/Flutter is represented with the QDM datatype and value set of Diagnosis, Inactive: Atrial Fibrillation/Flutter (OID: 2.16.840.1.113883.3.117.1.7.1.202)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. Denominator Exclusions *(Brief narrative description of exclusions from the target population)*
Denominator Exclusions:

- Patients with comfort measures documented.
- Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
- Patients discharged to another hospital.
- Patients who left against medical advice.
- Patients who expired.
- Patients discharged to home for hospice care.
- Patients discharged to a health care facility for hospice care.

Denominator Exceptions:

- Patients with a documented reason for not prescribing anticoagulation therapy at discharge.

S.11. Denominator Exclusion Details *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Denominator Exclusions Data Elements:
Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Discharge Status (modeled as Attributes of the above Non-Elective Inpatient Encounter)
- Discharge status: Left Against Medical Advice (OID: 2.16.840.1.113883.3.117.1.7.1.308)
- Discharge status: Patient Expired (OID: 2.16.840.1.113883.3.117.1.7.1.309)
- Discharge status: Discharge To Acute Care Facility (OID: 2.16.840.1.113883.3.117.1.7.1.87)
- Discharge status: Discharged to Home for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.209)
- Discharge status: Discharged to Health Care Facility for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.207)

Comfort Measures
- Comfort Measures are represented with the QDM datatypes and value set of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Denominator Exceptions Data Elements:
Reasons for Not Prescribing Anticoagulation Therapy
- Anticoagulant Ingredient Specific Medication is represented with the QDM datatype and value set of Medication, Discharge: Anticoagulant ingredient specific (OID: 2.16.840.1.113762.1.4.1021.9)
- Medical Reason is represented with the QDM datatype and value set of Medication, Discharge not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
- Patient Refusal is represented with the QDM datatype and value set of Medication, Discharge not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. Stratification Details/Variables *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. Risk Adjustment Type (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. Identify the statistical risk model method and variables *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. Detailed risk model specifications *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. Detailed risk model specifications (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. Type of score:
Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0436_CMS71v4_STK3_Bonnie_Testing.xlsx,STK3_eCQM_testing_attachment-635907890064535446.docx

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** 2833
Measure Title: STK03: Anticoagulation Therapy for Atrial Fibrillation/Flutter
Date of Submission: 1/14/2016
Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]
AND
If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR

- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful [16] differences in performance**;

OR

there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes

10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).

11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.

12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.

13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.

14. Risk factors that influence outcomes should not be specified as exclusions

15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE

Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure*. *Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**

☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: (*must be consistent with levels entered in item S.26*)	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

22 unique synthetic patient records were created in the BONNIE testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and medications were pre-determined to provide a variety of scenarios that adequately test patients passing

each data element and failing each data element. Data included in cases and tested for this measure included diagnoses, medications, discharge statuses, patient orders, procedures, age, length of stay, and ED and inpatient encounters.

All 22 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

Note*: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)

☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #04376 STK03: Anticoagulation Therapy for Atrial Fibrillation/Flutter, from which this measure is derived.

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program

which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e*.g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the chart-abstracted version of this measure for the time period of one year (4Q2010 to 3Q2011) have shown an overall agreement rate of 98.1%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-3.

Data Elements	total 'n' numerator	total 'n'denominator	rate
Anticoagulation Therapy Prescribed at Discharge	127	150	84.7%
Atrial Fibrillation/Flutter	446	467	95.5%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
Reason for Not Prescribing Anticoagulation Therapy at Discharge	38	46	82.6%

These agreement rates are considered to be well within acceptable levels.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☒ **Critical data elements** (*data element validity must address ALL critical data elements*)

☒ **Performance measure score**

☐ **Empirical validity testing**

☒ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic stroke and either a history of atrial ablation or diagnosis of atrial fibrillation/flutter appropriately fall into the measure. We have created negative test cases, testing to ensure patients without a principal diagnosis of ischemic stroke and either a history of atrial ablation or diagnosis of atrial fibrillation/flutter do not actually make it into the denominator.

Numerator test cases positively test to ensure patients receiving anticoagulant therapy at discharge pass the measure. Negative test cases ensure that a patient who does not receive anticoagulant therapy in the specified time frame do not make pass the measure.

Denominator exclusion and exception test cases for this measure ensure that patients are properly removed from the denominator if they have comfort measures, specific discharge statuses other than discharged home, and medical reasons or patient refusal for not getting anticoagulant therapy. Negative test cases are also run, an example of this would be comfort measures that are ordered but not in the specified time frame. Testing confirmed patients meeting the exclusion and exception criteria are removed from the measure appropriately.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

_____

2b3. EXCLUSIONS ANALYSIS

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with Comfort Measures
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients with a documented Reason For Not Prescribing Anticoagulation Therapy at Discharge
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Comfort Measures Only
Overall Occurrence n = 163,225
Overall Occurrence Percentage 10.4%
Minimum 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%

10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Patients with a documented Reason For Not Prescribing Anticoagulation Therapy at Discharge
Overall Occurrence n = 25,249
Overall Occurrence Percentage 8.01%
Minimum: 0.25%
10th Percentile: 1.96%
Median: 5.22%
90th Percentile: 16%
Maximum 84.46%

Exclusion: Discharge Disposition - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage 35.7%
Minimum: 0.787%
10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: Discharge Disposition - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: Discharge Disposition - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: Discharge Disposition- Patients discharged to home for hospice care
Overall Occurrence n = 658,264

Overall Occurrence Percentage 52.2%
Minimum: 6.25%
10th Percentile: 39%

Median: 51.9%
90th Percentile: 64%
Maximum 94.3%

Exclusion: Discharge Disposition - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage 3%
Minimum: 0.169%
10th Percentile: 0.87 %
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-abstracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

_____

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i.*e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE

2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0436: STK-3 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile

3Q2011	131	0.94408	0.16256	1	1	1	1	0.83333
2Q2011	131	0.94408	0.16256	1	1	1	1	0.83333
1Q2011	147	0.92518	0.17565	1	1	1	0.94737	0.66667
4Q2010	126	0.92909	0.19535	1	1	1	1	.8
3Q2010	119	0.94605	0.15078	1	1	1	1	0.75
2Q2010	113	0.93581	0.16405	1	1	1	0.93333	0.81818
1Q2010	90	0.91729	0.15775	1	1	1	0.88889	0.66667
4Q2009	43	0.90522	0.22409	1	1	1	0.875	0.8

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i.*e., what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS
If only one set of specifications, this section can be skipped.

Note: *This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i.*e., what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual performance (whether or not the case fails) is compared to expectations to ensure missing data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score)

If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment **Attachment:** STK3_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

Not applicable.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentiveprogram

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

- Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
- Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

- Name of program and sponsor Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable.

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures

Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.

Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**

0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation
0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge
0436 : STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter
0624 : Atrial Fibrillation - Anticoagulation Therapy
1525 : Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**

0624 : Atrial Fibrillation - Anticoagulation Therapy; Active Health Management – no longer NQF-endorsed.
0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation –status unspecified; AMAPCPI
0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge- status unspecified; AAN

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?

No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**

Measure 1525 from the American College of Cardiology is a physician performance measures identified through CPT codes and could extend to the outpatient setting. The measure evaluates physician practice as opposed to hospital processes. The target population for measure 1525 differs from measure 0436 Anticoagulation Therapy for Atrial Fibrillation/Flutter in that it includes in the denominator population all patients age 18 years and older with a diagnosis of nonvalvular atrial fibrillation or atrial flutter whose assessment of the specified thromboembolic risk factors indicate one or more high-risk factors or more than one moderate risk factor, as determined by CHADS2 risk stratification. It is not specified for ischemic stroke patients with atrial fibrillation/flutter only. NQF#0436: STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter: The measures are completely harmonized to the extent possible, given the fact that the data source for #0436 is the paper medical record, and the data source for #2833 is the electronic health record.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)

Not applicable.

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Brief Measure Information

NQF #: 2834
Measure Title: STK 04: Thrombolytic Therapy
Measure Steward: The Joint Commission

Brief Description of Measure: This measure captures the proportion of acute ischemic stroke patients who arrive at this hospital within 2 hours of time last known well for whom IV t-PA was initiated at this hospital within 3 hours of time last known well. This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.This measure captures the proportion of acute ischemic stroke patients who arrive at this hospital within 2 hours of time last known well for whom IV t-PA was initiated at this hospital within 3 hours of time last known well.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. STK-4, Thrombolytic Therapy, is one of six of the measures in this set that have been reengineered as eCQMs and are included in the EHR Incentive Program and Hospital Inpatient Quality Reporting Program.

Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Studies have demonstrated that the early administration of thrombolytic therapy within 3 hours of stroke symptom onset can significantly improve neurologic outcomes at 3 months in patients with ischemic stroke. The European Cooperative Acute Stroke Study (ECASS) III trial indicated that intravenous rtPA can be given safely to, and can improve outcomes for, carefully selected patients treated 3 to 4.5 hours after stroke; however, as the NINDS investigators concluded, the earlier that IV thrombolytic therapy is initiated, the better the patient outcome. Despite strong recommendations from the American Academy of Neurology, the American Heart Association, and the American College of Chest Surgeons, thrombolytic therapy is used in only a small proportion of ischemic stroke patients overall and in only a minority of eligible candidates.

Healthcare organizations that track IV thrombolytic administration for internal quality improvement purposes have seen a significant increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Acute ischemic stroke patients for whom IV thrombolytic therapy was initiated at this hospital within 3 hours (less than or equal to 180 minutes) of when it was witnessed or reported that the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.

Denominator Statement: Ischemic stroke patients admitted through the Emergency Department whose time of arrival is within 2 hours (less than or equal to 120 minutes) of the 1) time they were known to be at their baseline state of health; or 2) time of symptom onset if time last known at baseline state is not known.

Denominator Exclusions: Denominator Exclusions:
None.

Denominator Exceptions:
- Patients with comfort measures documented on the day of or the day after arrival

- Patients with intra-venous or intra-arterial Thrombolytic (t-PA) Therapy prior to arrival
- Patients with documentation of a National Institutes for Health Stroke Scale (NIHSS) score of zero in the emergency department
- Patients with Medical Reasons for not initiating IV thrombolytics documented by a physician/APN/PA or pharmacist on the day of or the day after arrival
- Patients with any of the following results within 180 minutes of the 1) time they were known to be at their baseline state of health; or 2) time of symptom onset:
  - Prothrombin Time > 15 seconds
  - Platelet Count <100,000
  - INR>1.7
  - Partial Thromboplastin Time > 40 seconds
  - Systolic Blood Pressure > 185 mmHg
  - Diastolic Blood Pressure > 110 mmHg
  - Patient refusal

Measure Type: Process

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary:

Evidence for this new eMeasure is the same as the existing measure #0437 STK 04: Thrombolytic Therapy:

- The body of evidence consistently supports that thrombolytic therapy results in a significant net reduction in the proportions of patients dead or dependent in activities of daily living due to ischemic stroke. Based on these findings, clinicians may choose to use thrombolytic therapy in selected patients within three hours of symptom onset.
- Class I, Level of Evidence A – 2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke, page 1676
  - Intravenous rtPA (0.9mg/kg, maximum dose 90 mg) is recommended for selected patients who may be treated within 3 hours of onset of ischemic stroke. Physicians should review the criteria outlined in Table 11 (which are modeled on those used in the NINDS trial) to determine the eligibility of the patient. A recommended regimen for observation and treatment of the patient is described in Table 12. This recommendation has not changed from previous statements.
- The 2012 Committee that reviewed the chart-abstracted version of this measure agreed that this measure was supported by strong evidence.

Guidance from the Evidence Algorithm:
Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure #0437 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure, therefore there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
  - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of data on 4 of 28 available eCQMs. This measure is 1 of the 28 eCQMs.
- The developer also provided performance data from the chart abstracted measure which seems to be very high with little to no room for improvement.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

***1a. Evidence** to Support Measure Focus*

Comments: **No new studies/information

**Evidence is based upon the companion paper measure, which is high and does not need further discussion.

1b. Performance Gap

Comments: **performance data from chart abstracted measure provided; no disparities data provided

**The performance gap data from the paper measure does show opportunity for improvement. The literature also supports room for improvement. The measure does not provide data regarding detailed performance in disparate patient subgroups. It is an overall hospital measure. The emeasure will provide greater detail on reasons for exclusion and should capture better quality data in order to truly determine whether a performance gap remains in the future.

1c. High Priority (previously referred to as High Impact)
Comments: **NA
**N/A

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart abstracted measure from which this measure is derived.

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Measure logic Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.

2a2. Reliability Testing Testing attachment

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 22 synthetic records created in the Bonnie testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Guidance from the Reliability Algorithm: Precise specifications (Box 1) →empiric reliability testing as specified (Box 2 → empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→ Assessed the measure logic only (Box 11) →Low certainty or confidence data used in measure are valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**

☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 22 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.
- The numerator, denominator, exclusions/exceptions , and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little to no room for improvement?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box2) → empirical testing of data elements using BONNIE tool (Box 3,10) → Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **Specifications consistent

**Bonnie testing suggests that the validity is acceptable as there was 100% coverage among the 22 synthetic patient records, indicating that there was a test case for each logic pathway, and there was a 100% passing rate indicating that the test cases performed as expected.

2a2. Reliability Testing

Comments: **Data element testing only

2b2. Validity Testing

Comments: **Yes not assessed

**There does not appear to be sufficient missing data to suggest a validity threat.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **Reliability testing only done at data element level not measure score level

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **All data elements available in EHR, good feasibility

**The required elements are routinely generated during care delivery for stroke at stroke centers, and therefore utilization of this eMeasure at stroke centers should be feasible per this criteria, and the Bonnie testing further supports overall feasibility. However, as with reliability and validity, it would seem that evidence that this will be feasible in EHR systems from different providers would be critical to assessing feasibility for general use.

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Not publicly reported, but in CMS accountability program through 2017; benefits outweigh potential unintended consequences

**Usability is similar to the usability for the non-eMeasure upon which this is based.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0164 : Fibrinolytic Therapy received within 30 minutes of hospital arrival
- 0288 : Fibrinolytic Therapy Received Within 30 Minutes of ED Arrival
- 1952 : Time to Intravenous Thrombolytic Therapy
- 0437 : STK 04: Thrombolytic Therapy

- 0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered – AMA-PCPI – no longer NQF endorsed

Harmonization:

- Measures 0288 and 0164 are AMI (Acute Myocardial Infarction) measures and are harmonized to the extent that the measures utilize some of the same data elements.
- The target population for measure 1952 from the American Heart Association/American Stroke Association also includes patients hospitalized for acute ischemic stroke; however, the measure captures average door-to-needle time and uses a target of less than 60 minutes rather than the proportion of patients who arrive within 2 hours and receive t-PA within 3 hours of time last known well.
- Measure 0242 is a physician level measure with a targeted population of ischemic stroke patients identified through CPT codes and could extend to the outpatient setting.
- #0437 and #2834 are completely harmonized to the extent possible, given the fact that the data source for #0437 is the paper medical record, and the data source for #2834 is the electronic health record.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0437 **NQF Project:** Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. **(evaluation criteria)**

1c.1 **Structure-Process-Outcome Relationship** *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to improve neurological outcomes for ischemic stroke patients through the timely initiation of intravenous (IV) thrombolytic therapy (t-PA) to carefully screened, eligible candidates.

IV thrombolytic therapy initiated >> improved neurological outcomes >> decreased morbidity and mortality.

1c.2-3 **Type of Evidence** *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 **Directness of Evidence to the Specified Measure** *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:

This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the early management of adults with ischemic stroke. The administration of thrombolytic agents to carefully screened, eligible patients with acute ischemic stroke has been shown to be beneficial in several clinical trials. These included two positive randomized controlled trials in the United States: The National Institute of Neurological Disorders and Stroke (NINDS) Studies, Part I and Part II. Based on the results of these studies, the Food and Drug Administration approved the use of intravenous recombinant tissue plasminogen activator (IV r-TPA or t-PA) for the treatment of acute ischemic stroke when given within 3 hours of stroke symptom onset. A large meta-analysis controlling for factors associated with stroke outcome confirmed the benefit of IV t-PA in patients treated within 3 hours of symptom onset. While controversy still exists among some specialists, the major society practice guidelines developed in the United States all recommend the use of IV t-PA for eligible patients. Physicians with experience and skill in stroke management and the interpretation of CT scans should supervise treatment.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: Relevant literature supporting thrombolysis for acute ischemic stroke was identified through a Cochrane review, prepared and maintained by The Cochrane Collaboration and published in The Cochrane Library 2009, Issue 4. The search strategy employed the Cochrane Stroke Group Trials Register (last searched October 2008), MEDLINE (1966 to October 2008) and EMBASE (1980 to October 2008). Selection criteria involved randomized trials of any thrombolytic agent compared with control in patients with definite ischemic stroke (i.e., computerized tomography (CT) or magnetic resonance imaging (MRI) having excluded intracranial hemorrhage prior to randomization).

The review included 26 trials involving 7152 patients. This review included all new trials completed and made public since 2003, as well as additional data published since 2003 from trials included in earlier versions of the review. The total number of patients included in the review represented a 10-fold increase in the number of study patients since the first review in 1990. Very few of the patients (0.5%) were aged over 80 years.

The primary outcomes measured were death or dependency, as defined by modified Rankin score of 3 to 6, and death at the end of follow-up. Not all trials contributed data to each outcome. The trials tested urokinase, streptokinase, recombinant tissue plasminogen activator, recombinant pro-urokinase or desmoteplase, Four trials used intra-arterial administration, the rest used the intravenous route. Most data came from trials that started treatment up to six hours after stroke; three trials started treatment up to nine hours and one small trial up to 24 hours after stroke. About 55% of data (patients and trials) came from trials testing intravenous tissue plasminogen activator.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting thrombolysis for acute ischemic stroke is high. The Cochrane Review noted above confirmed that thrombolytic treatment can reduce the risk of disability post-ischemic stroke, despite the bleeding risks. This review was conducted by two review authors who applied the selection criteria and extracted data. The reviewers assessed trial quality and verified the extracted data with the principal investigators of all major trials for both published and unpublished data. Specifically, the reviewers hand-searched journals from 1979 to April 1994; contacted 321 pharmaceutical companies for more information about trials known to exist and unknown based on prior searches; examined references quoted in thrombolytic therapy papers; contacted principal investigators of trials in Europe, North American, Japan, China , and Australia; and, attended multiple international conferences on stroke and thrombolysis since 1991). Every effort was made to identify truly randomized trials of thrombolytic therapy compared with placebo or open control in patients with acute ischemic stroke. Trials that were not truly random, such as dose-range-finding studies, were excluded.

According to the Cochrane reviewers, many trials had some imbalance in key prognostic variables. Several trials did not have complete blinding of outcome assessment. Thrombolytic therapy administered up to six hours after ischemic stroke significantly reduced the proportion of patients who were dead or dependent (modified Rankin 3 to 6) at three to six months after stroke (odds ratio (OR) 0.81, 95% Confidence Interval (CI) 0.73 to 0.90). Thrombolytic therapy increased the risk of symptomatic hemorrhage (OR 3.49, 95% CI 2.81 to 4.33) and death within three to six months after stroke (OR 1.31, 95% CI 1.14 to 1.50). Treatment within three hours of stroke appeared more effective in reducing death or dependency (OR 0.71, 95% CI 0.52 to 0.96) with no statistically significant adverse effect on death (OR 1.13, 95% CI 0.86 to 1.48). There was heterogeneity among the trials in part attributable to concomitant antithrombotic drug use (P =0.02), stroke severity and time to treatment. Antithrombotic drugs given soon after thrombolysis may increase the risk of death.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of

evidence consistently supports that thrombolytic therapy results in a significant net reduction in the proportions of patients dead or dependent in activities of daily living due to ischemic stroke. Based on these findings, clinicians may choose to use thrombolytic therapy in selected patients within three hours of symptom onset.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)***:**
There is strong evidence on the immediate hazards and net benefits of thrombolytic therapy in the treatment of acute ischemic stroke. Thrombolytic therapy administered up to six hours after ischemic stroke significantly reduced the proportion of patients who were dead or dependent (modified Rankin 3 to 6) at three to six months after stroke (odds ratio (OR) 0.81, 95% Confidence Interval (CI) 0.73 to 0.90). Treatment within three hours of stroke appeared more effective in reducing death or dependency (OR 0.71, 95% CI 0.52 to 0.96) with no statistically significant adverse effect or death (OR 1.13, 95% CI 0.86 to 1.48).

Treating ischemic stroke patients with IV t-PA within 3 hours of time last known well improves functional outcomes at 3 months. Considering the mean lifetime cost of ischemic stroke, estimated at $140,048 per person, thrombolytic therapy is also cost-effective. Fagan et al. (1998) used data from the NINDS rt-PA Stroke Trial and developed a Markov model to compare costs per 1,000 eligible t-PA patients with the costs per 1,000 untreated patients. This analysis revealed a greater than 90% probability of costs savings when eligible patients are treated with t-PA within 3 hours. In the NINDS rt-PA Stroke Trial, the average length of stay was significantly shorter for patients treated with t-PA than the placebo group (10.9 versus 12.4 days; p=0.002), and more patients were discharged to home than to an inpatient rehabilitation facility or a nursing home (48% versus 36%; p=0.002). The Markov model estimated an increase in hospitalization costs of $1.7 million and a decrease in rehabilitation costs of $1.4 million and nursing home cost of $4.8 million per 1,0000 eligible t-PA patients. Furthermore, the analysis estimated the long-term impact on health outcomes to be 564 quality-adjusted life-years saved over 30 years per 1,000 patients.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of IV thrombolytic therapy within 3 hours of stroke symptom onset is undisputed. No position against the administration of thrombolytic therapy to select, eligible ischemic stroke patients was noted in the literature. However, there is still not enough evidence to answer some questions. More randomized trials are needed to determine the full impact of benefit, the latest time window for safe administration, the cut-off age for treatment, the type of stroke and grades of severity most likely to respond favorably to treatment, and the impact of various co-morbidities and concomitant drug therapies on outcome.

1c.16 Quote verbatim, the specific guideline recommendation *(Including guideline # and/or page #)*:
2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke, page 1676.

Class I, Level of Evidence A
Intravenous rtPA (0.9mg/kg, maximum dose 90 mg) is recommended for selected patients who may be treated within 3 hours of onset of ischemic stroke. Physicians should review the criteria outlined in Table 11 (which are modeled on those used in the NINDS trial) to determine the eligibility of the patient. A recommended regimen for observation and treatment of the patient is described in Table 12. This recommendation has not changed from previous statements.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on January 6, 2007. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of

stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High **1c.26** Quality: High**1c.27** Consistency**:** High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0437_Evidence_MSF5.0_Data-635827722587031131.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. Briefly explain the rationale for this measure *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Studies have demonstrated that the early administration of thrombolytic therapy within 3 hours of stroke symptom onset can significantly improve neurologic outcomes at 3 months in patients with ischemic stroke. The European Cooperative Acute Stroke Study (ECASS) III trial indicated that intravenous rtPA can be given safely to, and can improve outcomes for, carefully selected patients treated 3 to 4.5 hours after stroke; however, as the NINDS investigators concluded, the earlier that IV thrombolytic therapy is initiated, the better the patient outcome. Despite strong recommendations from the American Academy of Neurology, the American Heart Association, and the American College of Chest Surgeons, thrombolytic therapy is used in only a small proportion of ischemic stroke patients overall and in only a minority of eligible candidates.

Healthcare organizations that track IV thrombolytic administration for internal quality improvement purposes have seen a significant increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. Provide performance scores on the measure as specified (current and over time) at the specified level of analysis. *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Many patients with acute ischemic stroke arrive at the hospital within three hours of stroke onset without documented contraindications who still do not receive intravenous (IV) thrombolysis (t-PA). Although rates of IV t-PA administration have

improved over time, there is still less than optimal performance especially in the lower quartile and decile of hospitals. In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Joint Commission ORYX performance measure data for 4Q 2009 yielded an average measure rate of 48.9% from 39 hospitals collecting data for this measure (n=233 patients). The average rate for all hospitals collecting data for this measure (i.e., 1099 hospitals; n=14,907 patients) is currently 84.5%, indicating that a potential performance gap of 15% persists if the optimal rate is 100%. Below is the specified level of analysis for STK-4 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 233 denominator cases; 114 numerator cases; 39 hospitals; 0.48927 national aggregate rate; 0.54417 mean of hospital rates; 0.41298 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.625 50th percentile rate/median rate; 0.03704 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2010: 1728 denominator cases; 1053 numerator cases; 129 hospitals; 0.60938 national aggregate rate; 0.56977 mean of hospital rates; 0.37503 standard deviation; 1.0 90th percentile rate; 0.9 75th percentile rate/upper quartile; 0.66667 50th percentile rate/median rate; 0.21212 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2011: 1942 denominator cases; 1333 numerator cases; 136 hospitals; 0.68641 national aggregate rate; 0.57338 mean of hospital rates; 0.37267 standard deviation; 1.0 90th percentile rate; 0.89737 75th percentile rate/upper quartile; 0.71964 50th percentile rate/median rate; 0.23611 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2012: 1807 denominator cases; 1393 numerator cases; 136 hospitals; 0.77089 national aggregate rate; 0.67283 mean of hospital rates; 0.34402 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.7735 50th percentile rate/median rate; 0.5 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2013: 3135 denominator cases; 2493 numerator cases; 224 hospitals; 0.79522 national aggregate rate; 0.74944 mean of hospital rates; 0.3186 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.875 50th percentile rate/median rate; 0.66667 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2014: 14,907 denominator cases; 12,598 numerator cases; 1099 hospitals; 0.84511 national aggregate rate; 0.75482 mean of hospital rates; 0.32814 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.88889 50th percentile rate/median rate; 0.66667 25th percentile rate/lower quartile; and, zero 10th percentile rate.

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
Since the last endorsement period, several large studies have evaluated trends in thrombolysis utilization across the United States. While disparities still exist for many groups, the disparity gap has narrowed for certain groups, e.g., older adults, young adults, women, and young blacks, since the last submission.

George and colleagues (2015) analyzed discharge data from 2005 to 2010 in the Nationwide Inpatient Sample (NIS) of the Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (Rockville, MD). This analysis identified persistent racial disparities for blacks and Hispanics consistent with those found previously for blacks and Hispanics (Kimball, et al. 2012), as well as, a trend to treat older adults who would not have been considered t-PA candidates in earlier years and increased utilization rates for rural patients. From this database, 512,429 older adults (> 65 years of age) with acute ischemic stroke who received an injection or infusion of a thrombolytic agent were identified and divided into three age groupings (65-74, 75-84, > 85 years). Among U.S. hospitals with acute stroke patients, there were an estimated 1462 hospitals (32%) administering thrombolysis in 2005 and 1884 hospitals (43%) in 2010 (trend P = 0.003). For older adult stroke admissions, the rate of thrombolysis increased from 1.7% (95% CI: 1.6-1.8%) in 2005 to 5.4% (95% CI: 5.2-5.6%) in 2010, representing a three-fold increase in thrombolysis rates for older adults (trend P < 0.001). The largest increases occurred for individuals > 85 years of age with an approximate four-fold rate increase from 2005 to 2010. Rates of administration increased three-fold for urban patients and urban hospitals. Thrombolysis rates also increased for rural patients (0.9% in 2005 vs. 3.3% in 2010; trend P < 0.001), and rural hospitals increased at a slower rate (0.5% in 2005 vs. 1.7% in 2010; (trend P < 0.001). Low volume hospitals increased their rates of thrombolysis in older adults to a lesser degree than higher

volume centers.

A second study using discharge data obtained from the Nationwide Inpatient Sample between 2001 and 2009 reported that disparities for young blacks has significantly improved in recent years (Kansara, et al. 2013). Between 2001 and 2009, there were an estimated 4,917, 217 admissions for acute ischemic stroke. Of these, 204,703 (4.16%) were young patients with a mean age approximately 37 years. The use of thrombolysis for young acute ischemic stroke patients increased 270% during this time period. The increased rate was noted across all races, including white, black, and nonwhite/nonblack populations. Unlike previous studies that reported that black patients were less likely to receive thrombolysis, this study found that a greater percentage of young black patients with acute ischemic stroke (5.45%) received thrombolysis that young white patients with acute ischemic stroke (4.57%) in 2009.

A univariate analysis of more than one million (N=1,093,895) acute ischemic stroke patients from 1683 hospitals participating in the American Heart Association's Get With the Guidelines-Stroke database was conducted to evaluate changes in the patterns of IV t-PA use over the 9-year period from April 2003 to December 2011. IV thrombolytic use has changed over time with a broader range of patients treated in later years. According to this analysis, the proportion of patients age > 85 years treated with IV t-PA increased from 10.5% in 2003-2005 to 16.4% in 2010-2011 (P<0.001). Also, the gender distribution of t-PA use changed slightly, with the proportion of t-PA use among women increasing from 48.6% t0 51%. The population receiving t-PA also became more diverse, with nonwhites accounting for 21.1% of t-PA use in 2003 to 2005 but 28.9% in 2010 to 2011(P<0.001) (Schwamm, et al. 2013). This study is among the first to describe the temporal trends of the past decade in IV t-PA use in patients with acute ischemic stroke in a clinically derived dataset from a sizeable cohort of U.S. hospitals nationwide.

Another published study utilized the American Heart Association's Get With the Guidelines-Stroke registry linked with Medicare claims data set to examine whether 30-day and 1-year outcomes differed by race/ethnicity among older patients with acute ischemic stroke (Qian, et al., 2013). Compared with other race/ethnicity groups, non-Hispanic black patients were less likely to receive IV t-PA in less than 3 hours from stroke onset. Relative to whites, black and Hispanic patients had higher adjusted 1-year all-cause rehospitalization (black: adjusted odds ratio, 1.28 [95% CI, 1.21-1.37]; Hispanics: adjusted odds ratio 1.22 [95% CI, 1.11-1.35]. Non-Hispanic black patients were more likely to be treated at high-volume and academic hospitals, which were generally located in the south. These findings were based on an analysis of 200,900 patients, including 20514 non-Hispanic blacks (10.2%), with acute ischemic stroke greater than 65 years of age from 926 U.S. centers participating in the GWTG-Stroke program from April 2003 through December 2008.

A prior 2011 report from the American Heart Association/American Stroke Association reported that racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al., 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted,

age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age: RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Minorities are less likely to use emergency medical services and more likely to wait longer before going to the hospital than are non-Hispanic whites. After hospital arrival, blacks or African Americans and possibly Hispanics experience longer wait times in the emergency department which results in treatment delays that include administration of thrombolytic therapy. Although unmeasured factors may play a role in these delays, the presence of bias in the delivery of care cannot be excluded (Cruz-Flores, et al., 2011).

The Department of Neurology and Stroke Program, Wayne State University School of Medicine, Detroit, MI (Bhattacharya P, et al., 2011) explored racial differences in the delivery of care to patients with acute stroke between hospitals certified in primary stroke care by The Joint Commission and noncertified hospitals. A retrospective chart review of 574 patients (25.1% African American) with ischemic stroke admitted to five Joint Commission certified primary stroke centers and five non-certified hospitals was conducted. Similar to previous studies, Bhattacharya found that African Americans often did not receive intravenous tPA because of a delay in hospital arrival. Whites were more likely to arrive by emergency transport services (65.5% vs 51.1%; P= 0.004) to be evaluated by a stroke team (19.1% vs. 7.7%; P=0.001), and to have documented National Institutes of Health Stroke Scale (NIHSS) score (40.2% vs. 29/9%; P=0.03); however, the number of white and black patients who received IV t-PA was not statistically different (2.1% in African Americans, 3.5% in Caucasians; P=0.40).

A larger study of 1044 patients (74% African American, 19% non-Hispanic white) with ischemic stroke (Hsia AW, et al., 2011), found that blacks were one-third less likely than whites to receive IV t-PA (3% vs.10%, P<0.001). Blacks were less likely than whites to present in 3 hours of symptom onset (13% vs. 21%; P=0.004). They were also less likely to be eligible candidates for thrombolytic therapy (5% vs. 13%; P<0.001). Of those patients who presented in 3 hours, blacks were almost half as likely to be treated with IV t-PA when compared to whites (27% vs. 46%; P=0.023).

A recent study from the Mayo Clinic, Rochester, MN (Naser DM, et al., 2011) investigated possible racial and ethnic disparities in the administration and outcome of recombinant tissue plasminogen activator (rt-PA) therapy for acute ischemic stroke in whites, blacks, Hispanics, and Asian/Pacific Islanders. Patients with a primary diagnosis of acute ischemic stroke who received rt-PA were identified using data from the National Inpatient Sample for 2001-2008 and stratified by race. The investigators analyzed the association of patient race on rt-PA utilization rate, in-hospital morbidity (i.e., discharges to a long-term care facility), intracranial hemorrhage (ICH) rate, and in-hospital mortality. Multivariate logistic regression analysis was performed to identify independent predictors of poor outcomes. Naser and colleagues concluded that whites had a higher rate of t-PA utilization than black and Hispanic patients (2.3% vs. 2.2% P= 0.07), although not statistically significant. Multivariate analysis of morbidity, mortality and ICH rates found that Asian/Pacific Islanders had significantly higher rates of mortality (odds ratio, 1.22, 95% CI, 1.91-2.11; P < .0001) compared with

whites. Thrombolytic utilization was greater in white and Asian/Pacific Islander patients than in black and Hispanic patients. Asian/Pacific Islander race was associated with increased risk of ICH and mortality with rt-PA administration.

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women account for almost 60% of US stroke deaths. (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$) (US Burden of Disease Collaborators, 2013). Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Thrombolytic therapy is one of the most promising treatments for acute ischemic stroke. The majority of strokes are due to blockage of an artery in the brain by a blood clot. Prompt treatment with clot dissolving (thrombolytic) drugs can restore blood flow before major brain damage has occurred. In the United States, Canada, and most European countries, alteplase/recombinant tissue plasminogen activator (rt-PA) has been approved for use within three hours of stroke symptom onset. Successful treatment is likely to improve neurological outcomes for ischemic stroke patients at three months and later; however, intracranial hemorrhage is a serious complication of therapy and may be fatal (Jauch EC, et al., 2013).

Clinical practice guidelines for intravenous thrombolysis with rt-PA (Adam HP, et al., 2007) cite the National Institute of Neurological Disorders and Stroke (NINDS) rt-PA Stroke Study (1995), which partially supported the approval of rt-PA by the U.S. Food and Drug Administration (FDA). The NINDS trial was conducted in two consecutive parts. Part A trials in the 1980s studied very low doses of thrombolytic therapy, given daily by intravenous route for several days. The onset of treatment occurred anytime from 5 to 14 days post symptom onset. Part A trials did not collect data on functional outcome. Part B trials from the 1990s and later used a single large dose of thrombolytic drug (80 to 100 mg rt-PA), given intravenously (IV) or intra-arterially (IA) within three, six, nine, or 24 hours of stroke. The primary end point in Part B of the study was a favorable outcome, defined as complete or nearly complete neurological recovery 3 months after stroke. Favorable outcomes were achieved in 31% to 50% of patients treated with rt-PA, as compared to 20% to 38% of patients given placebo (Kwiatkowski TJ, et al., 1999). The benefit was similar one year after stoke. The major risk of treatment was symptomatic intracranial hemorrhage which occurred in 6.4% of patients treated with rt-PA and 0.6% of patients given placebo (Marler JR, et al., 2007).

In 2008, European Cooperative Acute Stoke Study (ECASS)-3, a multi-center, prospective, randomized, placebo-controlled trial, studied the administration of rt-PA between three and 4.5 hours of stroke symptom onset (Hacke W, et al., 2008). The trial enrolled 418 patients treated with rt-PA per the current dosing guidelines (i.e., 0.9 mg/kg (maximum of 90 mg) with 10% given as an initial IV bolus and the remainder infused over one hour) and compared them with 403 who were given placebo. The frequency of the primary efficacy outcome (i.e., modified Rankin Scale score of 0 to 1 at 90 days after treatment) was significantly greater with rt-PA (52.4%) than with placebo (45.2%; OR 1.34, 95% CI 1.02 to 1.76; risk ratio 1.16, 95% CI 1.01 to 1.34; P= 0.04). The point estimate for the degree of benefit seen in ECASS-3 (OR for global favorable outcome, 1.28, 95% CI 1.00 to 1.65) was less than the point estimate of benefit found in the pool of patients enrolled for 0 to 3 hours after stroke symptom onset in the NINDS study (OR 1.9, 95% CI 1.2 to 2.9).

Currently, researchers, along with the field, continue to debate the risk of intracerebral hemorrhage with IV rt-PA in certain patient

populations; however, the benefit of improved functional outcomes, and potential improvements in quality of life outweighs the decision to with hold treatment of the ischemia (Saposnick, 2012).

Although the expanded timeframe of 3 to 4.5 hours for thrombolytic therapy was found to be effective for ischemic stroke patients and without significant increase in hemorrhagic events, a treatment target of 3 hours remains the accepted recommendation as studies have shown the potential opportunity for improved outcomes is greater with earlier treatment. Delays in evaluation and initiation of therapy for eligible patients with acute ischemic stroke should be avoided.

1c.5. If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful. *(Describe how and from whom their input*

was obtained.)
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Care Coordination, Health and Functional Status : Functional Status, Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK4_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** STK4_v5_Wed_Apr_01_12.15.32_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Acute ischemic stroke patients for whom IV thrombolytic therapy was initiated at this hospital within 3 hours (less than or equal to 180 minutes) of when it was witnessed or reported that the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Thrombolytic (t-PA) Therapy Administration
- Thrombolytic (t-PA) Therapy is represented with the QDM datatype and value set of Medication, Administered: Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.226)

Baseline State
- Baseline State is represented with the QDM datatype and value set of Physical Exam, Performed: Baseline State (OID: 2.16.840.1.113883.3.117.1.7.1.417)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Time of Symptom Onset
- Time of Symptom Onset is represented with the QDM datatype and value set of Physical Exam, Performed: Time of Symptom Onset (OID: 2.16.840.1.113762.1.4.1045.14)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.7. Denominator Statement *(Brief, narrative description of the target population being measured)*
Ischemic stroke patients admitted through the Emergency Department whose time of arrival is within 2 hours (less than or equal to 120 minutes) of the 1) time they were known to be at their baseline state of health; or 2) time of symptom onset if time last known at baseline state is not known.

S.8. Target Population Category *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. Denominator Details *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke
- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM data type and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Baseline State
- Baseline State is represented with the QDM datatype and value set of Physical Exam, Performed: Baseline State (OID: 2.16.840.1.113883.3.117.1.7.1.417)

Time of Symptom Onset
- Time of Symptom Onset is represented with the QDM datatype and value set of Physical Exam, Performed: Time of Symptom Onset (OID: 2.16.840.1.113762.1.4.1045.14)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. Denominator Exclusions *(Brief narrative description of exclusions from the target population)*
Denominator Exclusions:
None.

Denominator Exceptions:

- Patients with comfort measures documented on the day of or the day after arrival
- Patients with intra-venous or intra-arterial Thrombolytic (t-PA) Therapy prior to arrival
- Patients with documentation of a National Institutes for Health Stroke Scale (NIHSS) score of zero in the emergency department
- Patients with Medical Reasons for not initiating IV thrombolytics documented by a physician/APN/PA or pharmacist on the day of or the day after arrival
- Patients with any of the following results within 180 minutes of the 1) time they were known to be at their baseline state of health; or 2) time of symptom onset:
  - Prothrombin Time > 15 seconds
  - Platelet Count <100,000
  - INR>1.7
  - Partial Thromboplastin Time > 40 seconds
  - Systolic Blood Pressure > 185 mmHg
  - Diastolic Blood Pressure > 110 mmHg
  - Patient refusal

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*

Comfort Measures

- Comfort Measures are represented with the QDM datatypes and value set of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Reasons for Not Initiating IV Thrombolytic

- Medical Reason For Not Initiating IV Thrombolytic is represented with either of the following QDM datatypes and value sets:
  - Medication, Order not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
  - Medication, Administered not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
  - Medication, Order: t-PA ingredient specific (OID: 2.16.840.1.113762.1.4.1021.6)
  - Medication, Administered: Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.226)
- Laboratory Test, Performed: Prothrombin Time (OID: 2.16.840.1.113762.1.4.1045.24)
- Laboratory Test, Performed: Platelet Count (OID: 2.16.840.1.113883.3.117.1.7.1.267)
- Laboratory Test, Performed: INR (OID: 2.16.840.1.113883.3.117.1.7.1.213)
- Laboratory Test, Performed: Partial Thromboplastin Time (OID: 2.16.840.1.113762.1.4.1045.25)
- Physical Exam, Performed: Systolic Blood Pressure (OID: 2.16.840.1.113883.3.526.2.1044)
- Physical Exam, Performed: Diastolic Blood Pressure (OID: 2.16.840.1.113883.3.526.2.1045)
- Medication, Administered not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)
- Medication, Order not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)

Thrombolytic (t-PA) Therapy Already Administered

- Thrombolytic (t-PA) Therapy is represented with either of the following QDM datatypes and value sets:
  - Medication, Administered: Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.226)
  - Procedure, Performed: Intravenous Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113762.1.4.1045.15)

National Institutes for Health Stroke Scale (NIHSS)

- National Institutes for Health Stroke Scale (NIHSS) is represented with the QDM datatype and value set Risk Category Assessment: National Institute of Health Stroke Scale (OID: 2.16.840.1.113883.3.117.1.7.1.269)

Baseline State

- Baseline State is represented with the QDM datatype and value set of Physical Exam, Performed: Baseline State (OID: 2.16.840.1.113883.3.117.1.7.1.417)

Time of Symptom Onset

- Time of Symptom Onset is represented with the QDM datatype and value set of Physical Exam, Performed: Time of Symptom Onset (OID: 2.16.840.1.113762.1.4.1045.14)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM data type and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. Stratification Details/Variables *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. Risk Adjustment Type (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. Identify the statistical risk model method and variables *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. Detailed risk model specifications *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. Detailed risk model specifications (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. Type of score:
Rate/proportion
If other:

S.17. Interpretation of Score *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. Calculation Algorithm/Measure Logic *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file.

S.19. Calculation Algorithm/Measure Logic Diagram URL or Attachment *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. Sampling *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. Survey/Patient-reported data *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*

IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0437_CMS91v4_STK4_Bonnie_Testing.xlsx,STK4_eCQM_testing_attachment-635907800145590291.docx

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** 2834
Measure Title: STK04: Thrombolytic Therapy
Date of Submission: 1/14/2016
Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For <u>all</u> measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For <u>outcome and resource use</u> measures**, section **2b4** also must be completed.
- If specified for **<u>multiple data sources/sets of specificaitons</u>** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to <u>all</u> questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

<u>Note</u>: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]

AND

If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR

- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful** [16] **differences in performance**;

OR

there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes

10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).

11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.

12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.

13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.

14. Risk factors that influence outcomes should not be specified as exclusions

15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or

whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE

Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure. Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**
☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of:	**Measure Tested at Level of:**

(*must be consistent with levels entered in item S.26*)	
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☐ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

34 unique synthetic patient records were created in the Bonnie testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and medications were pre-determined to provide a variety of scenarios that adequately test patients passing each data element and failing each data element. Data included in cases and tested for this measure included diagnoses, medications, laboratory results, physical exams, patient orders, age, length of stay, and ED and inpatient encounters.

All 34 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

Note: *If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)
☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

Not applicable. Synthetic test patients were created in the Bonnie testing environment.

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #0437 STK-04: Thrombolytic Therapy, from which this measure is derived.

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify of potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 98.1%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-4.

Data Elements	total 'n' numerator	total 'n' denominator	agreement rate
Clinical Trial	712	714	99.7%
Date Last Known Well	181	206	87.9%
ED Patient	693	695	99.7%
Elective Carotid Intervention	711	714	99.6%
IV Thrombolytic Initiation	215	237	90.7%
IV Thrombolytic Initiation Date	25	27	92.6%
IV Thrombolytic Initiation Time	23	27	85.2%
Last Known Well	417	478	87.2%
Reason for Not Initiating IV Thrombolytic Therapy	155	202	76.7%
Time Last Known Well	157	198	80.0%

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

- ☒ **Critical data elements** (*data element validity must address ALL critical data elements*)
- ☒ **Performance measure score**
  - ☐ **Empirical validity testing**
  - ☒ **Systematic assessment of face validity of <u>performance measure score</u> as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic stroke admitted through the emergency department (ED), whose arrival time is within 2 hours of the 1) time they were known to

be at their baseline state of health or 2) time of symptom onset pass and fall into the measure. We have created negative test cases, with one example testing to ensure patients without a principal diagnosis of ischemic stroke do not actually make it into the denominator. Another example of negative testing is a test case that does not have an ED visit

Numerator test cases positively test to ensure patients receiving thrombolytic (t-PA) therapy within 3 hours of when it was witnessed or reported that the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health fall into the measure. Negative test cases ensure that a patient who does not receive t-PA therapy in the specified time frame do not make it into the numerator population.

Denominator exception test cases for this measure ensure that patients are properly removed from the denominator for the following reasons:

- comfort measures
- intra-venous (IV) or intra-arterial t-PA therapy prior to arrival
- documentation of first National Institutes for Health Stroke Scale (NIHSS) with result of 0 in the ED
- medical reasons for not receiving IV t-PA
- prothrombin time > 15 seconds
- platelet count < 100,000
- INR > 1.7
- partial thromboplastin time > 40 seconds
- systolic blood pressure > 185 mmHg
- diastolic blood pressure > 110 mmHg
- patient refusal

Negative test cases are also run, an example of this would be comfort measures that are ordered but not in the specified time frame. Another example is negatively testing a patient with a prothrombin time < 15 seconds who does not qualify for a denominator exclusion. Testing confirmed patients meeting the exception criteria are removed from the measure appropriately.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

_____

2b3. EXCLUSIONS ANALYSIS

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Time Last Known Well to arrival in the emergency department greater than 2 hours
- Patients with a documented Reason For Extending the Initiation of IV Thrombolytic
- Patients with a documented Reason For Not Initiating IV Thrombolytic

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Time Last Known Well to arrival in the emergency department greater than 2 hours
None

Exclusion: Patients with a documented Reason For Not Initiating IV Thrombolytic
Overall Occurrence n = 73,966
Overall Occurrence Percentage: 24%
Minimum: 0.42%
10th Percentile: 5.5%
Median: 14.6%
90th Percentile: 54%
Maximum: 92%

Exclusion: Patients with a documented Reason For Extending the Initiation of IV Thrombolytic
Overall Occurrence = 2,208
Overall Occurrence Percentage: 0.70%
Minimum: 0.09%
10th Percentile: 0.25%
Median: 0.69%
90th Percentile: 2.3%
Maximum: 35.2%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-abstracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES

If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i.*e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE

2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0437: STK-4 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	104	0.64221	0.40419	1	1	0.8	0.25	0
2Q2011	114	0.65061	0.40260	1	1	0.85714	0.33333	0
Q12011	116	0.6109	0.42108	1	1	0.775	0.0625	0
4Q2010	105	0.65572	0.40568	1	1	0.84615	0.33333	0
3Q2010	104	0.60829	0.42134	1	1	0.75	0	0
2Q2010	101	0.61933	0.38988	1	1	0.66667	0.33333	0
1Q2010	76	0.53939	0.41284	1	1	0.66667	0	0
4Q2009	39	0.54417	0.41298	1	1	0.625	0.03704	0

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i.*e., what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS

If only one set of specifications, this section can be skipped.

Note: *This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i.*e., what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual performance (whether or not the case fails) is compared to expectations to ensure missing data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility
Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.
3a. Byproduct of Care Processes For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order). 3a.1. **Data Elements Generated as Byproduct of Care Processes.** Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score) If other:
3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*
ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**
Attachment **Attachment:** STK4_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**
IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.
Not applicable.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.
Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. **Current and Planned Use**
NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://jointcommission.org EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentiveprograms

4a.1. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 Medicare-certified hospitals (2015)

- Name of program and sponsor: Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

- Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
- Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable.

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance

results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0164 : Fibrinolytic Therapy received within 30 minutes of hospital arrival
0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered
0288 : Fibrinolytic Therapy Received Within 30 Minutes of ED Arrival
0437 : STK 04: Thrombolytic Therapy
1952 : Time to Intravenous Thrombolytic Therapy

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered
American Medical Association - Physician Consortium for Performance Improvement (AMA-PCPI) – no longer NQF endorsed

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0288 and 0164 are AMI (Acute Myocardial Infarction) measures. They are part of the Centers for Medicare & Medicaid Services/The Joint Commission aligned measures relating to the administration of fibrinolytic therapy for hospital inpatients and are harmonized with 0437 to the extent that the measures utilize some of the same data elements. The target population for 0288 and 0164 is inpatients with an ICD-10-CM Principal Diagnosis Code for acute myocardial infarction. The target population for 0437 differs in that it includes patients hospitalized for acute ischemic stroke. In addition, the evidence around the timeframe for administration of therapy is different for the AMI and ischemic stroke populations, and 0288 and 0164 include administration of lytic drugs other than activase/alteplase/IV t-PA/recombinant tissue plasminogen activator (rt-PA). Measure 0164 will be removed from the CMS/The Joint Commission aligned measures starting with 01/01/2016 discharges. The target population for measure 1952 from the American Heart Association/American Stroke Association also includes patients hospitalized for acute ischemic stroke; however, the measure captures average door-to-needle time and uses a target of less than 60 minutes rather than the proportion of patients who arrive within 2 hours and receive t-PA within 3 hours of time last known well. Measure 0242 is a physician performance measure with a targeted population of ischemic stroke patients identified through CPT codes and could extend to the outpatient setting. This measure evaluates physician practice as opposed to hospital processes. It is no longer NQF-endorsed. NQF#0437: STK 04: Thrombolytic Therapy: The measures are completely harmonized to the extent possible, given the fact that the data source for #0437 is the paper medical record, and the data source for #2834 is the electronic health record.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not applicable.

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Measure Developer/Steward Updates and Ongoing Maintenance

Ad.2 **Year the measure was first released:** 2012

Ad.3 **Month and Year of most recent revision:** 04, 2015

Ad.4 **What is your frequency for review/update of this measure?** Annual

Ad.5 **When is the next scheduled review/update for this measure?** 04, 2016

Ad.7 **Disclaimers:** These performance measures are not clinical guidelines and do not establish a standard of medical care, and have not been tested for all potential applications. The measures and specifications are provided without warranty.

Ad.8 **Additional Information/Comments:** Not applicable.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

To navigate the links in the worksheet: Ctrl + click link to go to the link; ALT + LEFT ARROW to return

Brief Measure Information

NQF #: 2835
Measure Title: STK 05: Antithrombotic Therapy By End of Hospital Day Two
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients who had antithrombotic therapy administered by end of hospital day two (with the day of arrival being day 1).

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-6: Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. STK-5, Antithrombotic Therapy By End of Hospital Day Two, is one of six of the measures in this set that have been reengineered as eCQMs and are included in the EHR Incentive Program and Hospital Inpatient Quality Reporting Program.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of early antithrombotic administration in reducing stroke mortality recurrence rates has been demonstrated in several large clinical trials. Data suggest that antithrombotic therapy should be administered by the end of hospital day two to reduce stroke mortality and morbidity as long as no contraindications exist.

Healthcare organizations that track antithrombotic therapy prescribed by the end of day two for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Patients who had antithrombotic therapy administered the day of or day after hospital arrival.
Denominator Statement: Patients with a principal diagnosis of Ischemic stroke.
Denominator Exclusions: Denominator Exclusions:

- Patients who have a duration of stay less than 2 days
- Patients with comfort measures documented on day or the day after arrival
- Patients with intra-venous or intra-arterial Thrombolytic (t-PA) Therapy administered within 24 hours prior to arrival or anytime during hospitalization.

Denominator Exceptions:

- Patients with a documented reason for not administering antithrombotic therapy the day of or day after hospital arrival.

Measure Type: Process
Data Source: Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Most Recent Endorsement Date:

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary:

Evidence for this new eMeasure is the same as the existing measure #0438 STK 05: Antithrombotic Therapy By End of Hospital Day Two:

- The body of evidence consistently supports that early antithrombotic therapy reduces the risk of non-fatal stroke and death for patients who have experienced an acute ischemic stroke. There is no evidence refuting the benefit of this recommendation.
- Class I, Level of Evidence A – AHA ASA 2007 Guidelines for the Early Management of Adults with Ischemic Stroke, page 1681.
    - The oral administration of aspirin (initial dose is 325 mg) within 24 to 48 hours after stroke onset is recommended for treatment of most patients (Class I, Level of Evidence A). This recommendation has changed in that a dose of aspirin is now included.

Questions for the Committee:
The developer attests the underlying evidence for the measure #0438 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure; therefore there is no need for repeat discussion and voting on Evidence?

Guidance from the Evidence Algorithm: Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency: high (Box 5) → Box 5a High

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**
Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
    - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of data on 4 of 28 available eCQMs. This measure is 1 of the 28 eCQMs.
- The developer also provided performance data from the chart abstracted measure which seems to be very high with little to no room for improvement.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-

Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group; however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*

  How can this measure be used to better understand disparities in care and outcomes for certain groups?

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **Similar to #0438 chart abstracted this is eMeasure.

Agree-level of evidence has not changed. No need repeat discussion from #0438.

**evidence supports eMeasure

**This eMeasure relies on the same body of evidence as previously-endorsed NQF measure 438. I am not aware of any new information that changes the evidence base.

**Evidence same as 0438. No change in evidence. No vote needed.

1b. Performance Gap

Comments: **no data for this eMeasure

**Performance data not available but chart abstracted performance data high participation

**No performance data for the eMeasure is available, but one would expect high performance with little, if any, room for improvement, based on the chart-abstracted measure.

Data could be analyzed/stratified by sociodemographic variables to identify disparities in care.

**No data presented for eMeasure. Disparities in stroke incidence and care are noted elsewhere. These are not directly addressed in the data for this measure. The presence and use of this measure and 0438 should enable collection of disparities data for future reviews.

1c. High Priority (previously referred to as High Impact)

Comments: **Quality construction easy to assess.

**NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart abstracted measure from which this measure is derived.

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*

- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor Review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.

2a2. Reliability Testing **Testing attachment**

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 31 synthetic records created in the Bonnie testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Guidance from the Reliability Algorithm: Precise specifications (Box 1) →empiric reliability testing as specified (Box 2) → empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→Assessed the measure logic only →Low certainty or confidence data used in measure are valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**
☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 31 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.
- The numerator, denominator, exclusions/exceptions, and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little to no room for improvement?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from Validity Algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box2) → empirical testing of data elements using BONNIE tool (Box 3,10) → Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **NA

**Acceptable

**Again all specifications seem appropriate and positive. As noted above, varying use of different antithrombolitics and doses may make validity appraisal more problematic.

2a2. Reliability Testing

Comments: **See above. Small sample size.

Is this adequate to generalize for widespread implementation? Unknown...

**Not concerned about not testing face validity

**No validity data from eMeasure use. 31 Bonnie test results use. All indications are very positive. Real data remain to be seen.

2b2. Validity Testing

Comments: **Agree with measure worksheet-insufficient data to rate validity.

**Numerous threats to validity

**Exclusions align with chart data. No risk adjustments. Aspirin effects are identified as modest but positive. There is a plan for dealing with missing data, but no frequency data are presented.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **Reliability based on small synthetic data set limits reliability assessment.

**Low

**Reliability testing appears to be insufficient to truly judge the performance of the eMeasure on actual EHR data.

**There are no direct data from eMeasure use, but data from 0438 seem appropriate. Bonnie test results on 31 cases are positive - though this number is relatively small. Test with real (vs. synthetic) cases is preferable.

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Clinical data should be routinely generated-unknown how accurate abstraction might be.

**Acceptable

**I am concerned that exclusions will not be identified correctly without manual abstraction.

I am not certain all data elements are defined fields in EHR

**This is a legacy measure. EHR data should be readily available. Data accuracy are not assessed. Are exclusions in the EHR accurate.

There is data entry time and data extraction/review time. Is there an appropriate cost/benefit ratio to the use of this measure?

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.

- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Not currently publicly reported. Paper measure is in use. in use.

**No performance data but chart abstracted usability acceptable

**eMeasure is not being publicly reported but chart-abstracted measure is.

**This measure is a part of accountability programs. It is assumed that results in more frequent administration of anti-thrombolitics before end of day two. That should result in improved care. There is no evidence of unintended consequences (assuming appropriate identification of exclusions) other than the time and effort to record and review data.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two
- 0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
- 0435 : STK 02: Discharged on Antithrombotic Therapy
- 0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two

- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology – not NQF endorsed

Harmonization:

- Measure 0435, Discharged on Antithrombotic Therapy, is the second (STK-2) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in the two measures. #0435 focuses on the prescription of antithrombotic medications at the time of hospital discharge. All other data elements are aligned between

the two measures.

- Measure 0068 is a physician level measure with a different target population - patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI).
- NQF#0438: STK 05: Antithrombotic Therapy By End of Hospital Day Two: The measures are completely harmonized to the extent possible, given the fact that the data source for #0438 is the paper medical record, and the data source for #2835 is the electronic health record.

Pre-meeting public and member comments

- No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0438 **NQF Project:** Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. **(evaluation criteria)**

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)***:**
The focus of the measure is to decrease stroke recurrence rates for ischemic stroke patients by administering aspirin or another antithrombotic medication within 2 days of symptom onset.
Antithrombotic administered by end of hospital day 2 >> secondary stroke prevention >> decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)***:**
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)***:**
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the early management of adults with ischemic stroke. A small but statistically significant decline in risk of mortality and morbidity has been demonstrated when aspirin is administered within 48 hours after onset of stroke. The primary effects of aspirin are due to reduction of early recurrent stroke rather than limitation of neurological consequences of the stroke. The focus of both the performance measure and the body of evidence supports the need for early administration of antithrombotic therapy.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: The two most frequently cited trials in the literature are the International Stroke Trial (i.e., 300 mg of aspirin daily versus control; 1994) and the Chinese Acute Stroke Trial(i.e., 160 mg aspirin daily versus control; 1997). Prior to these trials, there was little to no information about the effects of antiplatelet agents on acute ischemic stroke.

In 2002, the Antithrombotic Trialists' Collaboration published a systematic overview of the relevant literature supporting antiplatelet therapy for prevention of death, myocardial infarction, and stroke in high risk patients. The collaboration reviewed 287 studies involving 135,000 patients in comparisons of antiplatelet therapy versus control and 77,000 patients in comparisons of different antiplatelet regimens. Relevant trials were identified through electronic database searches (MEDLINE, Embase, Derwent, Scisearch, and Biosis), searching the trial registers of the Cochrane Stroke and Peripheral Vascular Disease Groups; manual searching of journals, abstracts, and proceedings of meetings; scrutinizing the reference lists of trials and review articles; and professional inquiry, including colleagues and representatives of pharmaceutical companies.

The meta-analysis identified seven randomized control trials encompassing 40,821 patients that focused on the effects of antithrombotic therapy in acute ischemic stroke patients. The patients enrolled in these seven trials received on average three weeks of antiplatelet therapy following the onset of acute stroke symptoms. Overall, antiplatelet therapy resulted in a proportional reduction of 11% in vascular events (i.e., non-fatal stroke or death).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting early antithrombotic administration for patients with acute ischemic stroke is high. Multiple large randomized control studies have been published that studied the effects of aspirin, aspirin in combination with other antithrombotic agents, and alternative antithrombotic agents as monotherapy. As noted by the AHA/ASA and the American Academy of Neurology, the early administration of antithrombotic therapy, the focus of this measure, has been found to protect against stroke recurrence in the initial weeks following ischemic stroke. The administration of aspirin is not a substitute for other acute interventions, especially intravenous administration of thrombolytic therapy (IV t-PA), for the treatment of acute ischemic stroke. The administration of aspirin as an adjunctive therapy within 24 hours of IV t-PA is also not recommended.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that early antithrombotic therapy reduces the risk of non-fatal stroke and death for patients who have experienced an acute ischemic stroke. There is no evidence refuting the benefit of this recommendation.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
According to the Antithrombotic Trialists' Collaboration meta-analysis, there is strong evidence on the immediate hazards and net benefits of early antithrombotic administration for the prevention of stroke recurrence. Four of the seven trials included in the trialists' 2002 meta-analysis separated stroke outcomes into those considered to be due to hemorrhagic events and those of ischemic or unknown origin. Antithrombotic therapy produced an absolute excess of 1.9 hemorrhagic strokes per 1,000 patients, which was counterbalanced by an absolute reduction of 6.9 fewer ischemic strokes per 1,000, yielding an overall risk reduction in the risk of any further stroke of 5.4 per 1,000 patients. The excess risk of major extracranial hemorrhage was estimated at about three excess bleeds per 1,000 patients receiving early antithrombotic therapy. An increased risk of bleeding was associated with concurrent heparin administration (i.e., absolute excess 9 bleeds per 1,000 with heparin versus 2 bleeds per 1,000 without heparin.

As previously stated, the benefits of early antithrombotic therapy outweigh the risks of hemorrhage. Aspirin is a cost-effective therapy (Gaspoz, et al., 2002).

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of early antithrombotic therapy post ischemic stroke is undisputed. No position against early antithrombotic therapy was noted in the literature; however, the substitution of early antithrombotic therapy for other acute interventions, (i.e., IV t-PA) is not recommended. Additionally, the administration of antithrombotic medications in conjunction with other antithrombotic agents (e.g., heparin) or soon after IV t-PA administration is inadvisable.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on January 6, 2007. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 **Grade Assigned to the Recommendation:** Class I, Level of Evidence A

1c.24 **Rationale for Using this Guideline Over Others:** The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form

0438_Evidence_MSF5.0_Data-635827722640851821.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*

Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of early antithrombotic administration in reducing stroke mortality recurrence rates has been demonstrated in several large clinical trials. Data suggest that antithrombotic therapy should be administered by the end of hospital day two to reduce stroke mortality and morbidity as long as no contraindications exist.

Healthcare organizations that track antithrombotic therapy prescribed by the end of day two for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-5 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 1955 denominator cases; 1875 numerator cases; 49 hospitals; 0.95908 national aggregate rate; 0.95947 mean of hospital rates; 0.10574 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.94949 50th percentile rate/median rate; 0.85165 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2010: 18,728 denominator cases; 18,223 numerator cases; 137 hospitals; 0.97304 national aggregate rate; 0.95924 mean of hospital rates; 0.08189 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98361 50th percentile rate/median rate; 0.96183 25th percentile rate/lower quartile; and, 0.90909 10th percentile rate.

CY 2011: 22,328 denominator cases; 21,814 numerator cases; 157 hospitals; 0.97698 national aggregate rate; 0.95933 mean of hospital rates; 0.10243 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98667 50th percentile rate/median rate; 0.96053 25th percentile rate/lower quartile; and, 0.928 10th percentile rate.

CY 2012: 22,258 denominator cases; 21,866 numerator cases; 158 hospitals; 0.98239 national aggregate rate; 0.98042 mean of hospital rates; 0.03174 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99396 50th percentile rate/median rate; 0.97143 25th percentile rate/lower quartile; and, 0.95098 10th percentile rate.

CY 2013: 33,651 denominator cases; 33,133 numerator cases; 263 hospitals; 0.98461 national aggregate rate; 0.97976 mean of hospital rates; 0.04874 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99422 50th percentile rate/median rate; 0.9781 25th percentile rate/lower quartile; and, 0.95745 10th percentile rate.

CY 2014: 162,275 denominator cases; 159.848 numerator cases; 1300 hospitals; 0.98504 national aggregate rate; 0.97832 mean of hospital rates; 0.07287 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99261 50th percentile rate/median rate; 0.97832 25th percentile rate/lower quartile; and, 0.95707 10th percentile rate.

1b.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability.** *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. **If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.**
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers,

immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al., 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer, et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).
In terms of early antithrombotic administration, no significant disparities were noted across studies. Recent cross-sectional studies from nationwide health surveys suggest that once patients have a stroke, the use of most risk-reduction strategies does not vary significantly by race. An analysis of 1045 veteran patients found the use of aspirin similar for blacks or African Americans and whites, although the intervention was underutilized with aspirin administration in approximately 74% for both groups (Ross and Bravata, 2009). Similarly, data from the Centers for Disease Control (CDC) Behavioral Risk Factor Surveillance System (BRFSS) showed that black or African American stroke survivors were no less likely to be prescribed aspirin than whites.

Since the last endorsement date, several studies have reported results similar to those from BRFSS in 2009. Schwamm and colleagues (2010) found significant and important differences in quality of care related to early antithrombotics when multivariate models were constructed adjusting for patient-level characteristics only. Race/ethnicity Black versus White: unadjusted OR 0.96 [95% CI 0.92-

1.00]; adjusted for patient characteristics OR 0.90 [95% CI 0.86-0.94]; adjusted for patient and hospital characteristics OR 0.97 [95% CI 0.91-1.02]. Race/ethnicity Hispanic versus White: unadjusted OR 0.95 [95% CI 0.88-1.02]; adjusted for patient characteristics OR 0.89 [95% CI 0.83-0.96]; adjusted for patient and hospital characteristics OR 0.96 [95% CI 0.88-1.05]. Total N=271,769; All n 94.23%; White 94.28%; Black 94.08%; Hispanic 93.98%.

A more recently published study (Qian F, et al, 2013) from GWTG found that non-Hispanic black patients were less likely to receive early antithrombotics when compared to other race/ethnicity groups. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for early antithrombotic therapy: non-Hispanic White (n=170,694) 94.9%; non-Hispanic Black (n=20,514) 94.0%; Hispanic (n=6632) 94.3%; and non-Hispanic Asian American (n=3060) 94.8% Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) for early antithrombotic therapy were similar (n=58,823): White 96.5%; Other Race 95.6% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 (P<0.05) (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Antithrombotic agents significantly reduce the incidence of a recurrent vascular event after a stroke. Among these agents, aspirin has been the drug most widely studied. The International Stroke Trial demonstrated that antithrombotic administration, specifically aspirin, within the first 48 hours after stroke, significantly reduced the risk recurrent ischemic stroke and death (11.3% vs. 12.4%) in the first 14 days following the event. In conjunction with this, findings from the Chinese Acute Stroke Trial indicate that aspirin produces a modest reduction of approximately 10 deaths per 1000 during the first few weeks. Both trials recommend that aspirin should be given as soon as possible after the onset of stroke symptoms. It appears that the primary benefits of aspirin are due to early reduction in recurrent stroke rather than limitation of neurological deficits of the first stroke. For early antithrombotic therapy, oral administration of aspirin (initial dose is 325 mg) within 24 to 48 hours after stroke onset remains the current clinical guideline recommendation for treatment of most patients (Jauch, E. C., et al., 2013; Sandercock, P. A., et. al., 2014).

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK5_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** SKT5Stroke_v4_Mon_Apr_06_11.03.30_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Patients who had antithrombotic therapy administered the day of or day after hospital arrival.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Antithrombotic Therapy
- Antithrombotic Therapy is represented with the QDM datatype and value set of Medication, Administered: Antithrombotic Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.201)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Patients with a principal diagnosis of Ischemic stroke.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke
- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)

- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM data type and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
Denominator Exclusions:
- Patients who have a duration of stay less than 2 days
- Patients with comfort measures documented on day or the day after arrival
- Patients with intra-venous or intra-arterial Thrombolytic (t-PA) Therapy administered within 24 hours prior to arrival or anytime during hospitalization.

Denominator Exceptions:
- Patients with a documented reason for not administering antithrombotic therapy the day of or day after hospital arrival.

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Denominator Exclusions:
Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM data type and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Thrombolytic (t-PA) Therapy Already Administered
- Thrombolytic (t-PA) Therapy is represented with either of the following QDM datatypes and value sets:
  - Medication, Administered: Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.226)
  - Procedure, Performed: Intravenous or Intra-arterial Thrombolytic (t-PA) Therapy (OID: 2.16.840.1.113762.1.4.1045.21)

Comfort Measures
- Comfort Measures are represented with the QDM datatypes and value set of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Denominator Exceptions:
Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM data type and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

Reasons for Not Administering Antithrombotic Therapy
- Antithrombotic Ingredient Specific Medication is represented with the QDM datatype and value set of Medication, Order: Antithrombotic ingredient specific (OID: 2.16.840.1.113762.1.4.1021.8)
- Antithrombotic Medication is represented with the QDM datatype and value set of Medication, Administered: Antithrombotic Therapy (OID: 2.16.840.1.113883.3.117.1.7.1.201)
- Medication, Order not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
- Medication, Administered not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)

- Medication, Order not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)
- Medication, Administered not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. **Type of score:**
Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available in attached appendix at A.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.

eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0438_CMS72v4_STK5_Bonnie_Testing.xlsx,STK5_eCQM_testing_attachment-635907890708491062.docx

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** 2835

Measure Title: STK05: Antithrombotic Therapy By End of Hospital Day Two

Date of Submission: 1/14/2016

Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on

testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]
AND
If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):
- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR
- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful** [16] **differences in performance**;
OR
there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes
10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-

item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).
11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.
12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.
13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.
14. Risk factors that influence outcomes should not be specified as exclusions
15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE
Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure. Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**
☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: (*must be consistent with levels entered in item S.26*)	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

31 unique synthetic patient records were created in the BONNIE testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and medications were pre-determined to provide a variety of scenarios that adequately test patients passing each data element and failing each data element. Data included in cases and tested for this measure included diagnoses, medications, procedures, patient orders, age, length of stay, and ED and inpatient encounters.

All 31 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

***Note**: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)
☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #0438 Antithrombotic Therapy By End of Hospital Day Two, from which this measure is derived.

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.

- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the chart-abstracted version of this measure for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 97.2%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-5.

Data Elements	total'n'numerator	total'n'denominator	rate
Antithrombotic Therapy Administered By End of Hospital Day 2	426	449	95.0%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
IV OR IA Thrombolytic Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival	464	476	97.5%
Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2	44	47	93.6%

These agreement rates are considered to be well within acceptable levels.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☒ **Critical data elements** (*data element validity must address ALL critical data elements*)

☒ **Performance measure score**

☐ **Empirical validity testing**

☒ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and

logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic stroke appropriately fall into the measure. We have created negative test cases, testing to ensure patients with a different principal diagnosis do not actually make it into the denominator.

Numerator test cases positively test to ensure patients receiving antithrombotic therapy administered the day of or day after hospital arrival pass the measure. Negative test cases ensure that a patient who does not receive antithrombotic therapy in the specified time frame do not pass the measure.

Denominator exclusion and exception test cases for this measure ensure that patients are properly removed from the denominator if they have length of stay less than 2 days, comfort measures, received intra-venous or intra-arterial thrombolytic therapy within specified timeframe, and medical reasons or patient refusal for not getting antithrombotic therapy. Negative test cases are also run, an example of this would be comfort measures that are ordered but not in the specified time frame. Testing confirmed patients meeting the exclusion and exception criteria are removed from the measure appropriately.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

2b3. EXCLUSIONS ANALYSIS
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national

use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

- The following exclusions were analyzed for frequency and variability across providers:
- Patients less than 18 years of age
- Patients who have a Duration of Stay less than 2 days
- Patient who have a Length of Stay greater than 120 days
- Patients with Comfort Measures documented on day of or day after arrival
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients discharged prior to the end of hospital day 2
- Patients with IV OR IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival
- Patients with a documented Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Comfort Measures Only documented on day of or day after arrival
Overall Occurrence n = 28,126
Overall Occurrence Percentage 4.46%
Minimum 0.31%
10th Percentile: 1.67%
Median: 4.40%
90th Percentile: 9.09%
Maximum: 30.8%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 23.5%
Maximum: 95.2%

Exclusion: Patients with IV OR IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival

Overall Occurrence n = 25,354
Overall Occurrence Percentage 8.04%
Minimum: 0.25%
10th Percentile: 2.1%
Median: 6.72%
90th Percentile: 13.5%
Maximum: 47.4%

Exclusion: Patients with a documented Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2
Overall Occurrence n = 22,404
Overall Occurrence Percentage 7.11%
Minimum: 0.351%
10th Percentile: 1.48%
Median: 4.16%
90th Percentile: 14.9%
Maximum: 76.9%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-asbtracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i*.e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE
2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0438: STK-5 Distribution of Measure Results
Quarter #hospitals Mean SD 90th% 75th% 50th% 25th% 10th Percentile

3Q2011	154	0.97045	0.0735	1	1	1	0.9697	0.92857
2Q2011	155	0.96839	0.08678	1	1	1	0.97143	0.93333
1Q2011	159	0.95328	0.12687	1	1	1	0.95833	0.91304
4Q2010	135	0.96697	0.104	1	1	1	0.96667	0.93023
3Q2010	129	0.95443	0.12216	1	1	1	0.96226	0.88889
2Q2010	122	0.95333	0.12219	1	1	1	0.95556	0.90625
1Q2010	100	0.9521	0.12692	1	1	1	0.96	0.87298
4Q2009	49	0.95947	0.10574	1	1	0.98519	0.96875	0.93478

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i.*e., what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS
***If only one set of specifications, this section can be skipped*.**

Note: *This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i.*e., what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual performance (whether or not the case fails) is compared to expectations to ensure missing data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**
Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score)
If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*
ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**
Attachment **Attachment:** STK5_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**
IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.
Not applicable.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.
Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. **Current and Planned Use**
NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentiveprograms

4a.1. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor

- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

- Name of program and sponsor: Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

- Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
- Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable.

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. Progress on Improvement. (Not required for initial endorsement unless available.)
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of

initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
0435 : STK 02: Discharged on Antithrombotic Therapy
0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0435 Discharged on Antithrombotic Therapy is the second (STK-2) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in this measure than STK-5. STK-2 focuses on hospital discharge and the prescription of antithrombotic medications at that time. All common data elements are completely aligned between the two measures. NQF#0438: STK 05: Antithrombotic Therapy By End of Hospital Day Two: The measures are completely harmonized to the extent possible, given the fact that the data source for #0438 is the paper medical record, and the data source for #2835 is the electronic health record. Measure 0068 is a physician performance measure and thus a different level of measurement. Measure 0068 encompasses a different target population, specifically patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI). Both of these measures evaluate physician practice as opposed to hospital processes.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not applicable.

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Brief Measure Information

NQF #: 2836
Measure Title: STK-06: Discharged on Statin Medication
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients who are prescribed a statin medication at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. STK-6, Discharged on Statin Medication, is one of six of the measures in this set that have been reengineered as eCQMs and are included in the EHR Incentive Program and Hospital Inpatient Quality Reporting Program.

Developer Rationale:
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Recent guidelines recommend high-intensity statin therapy for patients with ischemic stroke unless contraindicated or patient characteristics require dosage modification.

Healthcare organizations that track this measure for internal quality improvement purposes have seen an increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Patients prescribed statin medication at hospital discharge.
Denominator Statement: Patients with a principal diagnosis of ischemic stroke.
Denominator Exclusions: Denominator Exclusions:
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients with comfort measures documented.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care
Patients with an LDL-c of less than 70 mg/dL <30 days prior to arrival or any time during the hospital stay

Denominator Exceptions:
Patients with a reason for not prescribing statin medication at discharge.

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary or **Summary of prior review in 2012**

- The body of evidence provided supports that statin therapy should be prescribed for stroke prevention in patients with a prior history of ischemic stroke and transient ischemic attack . Based on these findings, there is a correlation between the use of statins in lowering LDL cholesterol and stoke occurrence. These findings are consistent across several clinical trials.
- 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 233.
  - Class I, Level of Evidence B – Statin therapy with intensive lipid-lowering effects is recommended to reduce the risk of stroke and cardiovascular events among patients with ischemic stroke or TIA who have evidence of arthrosclerosis, and LDL-c level > 100 mg/dL, and who are without known CHD.
- The 2012 Committee expressed no concerns regarding the evidence underlying this measure.

Exception to evidence

N/A

Guidance from the Evidence Algorithm

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: Moderate; Consistency high (Box 5) → Box 5b Moderate

Questions for the Committee:

- *The developer attests the underlying evidence for the measure #0439 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure, therefore there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
  - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of data on 4 of 28 available eCQMs. This measure is one of the 28 eCQMs.

- The developer provided a summary of data from the literature that demonstrated underutilization of antithrombotic therapy and a performance gap in Medicare patients.
- The developer also provided performance data from the chart abstracted measure which seems to be very high with little to no room for improvement.

Disparities

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*
- *If no disparities information is provided, are you aware of evidence that disparities exist in this area of healthcare?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **same issue with evidence as standard measure; changed criteria without new evidence

**This measure is a process measure the evidence of which seems to relate directly to the outcome being measured. This is not a maintenance measure nor is it measuring a health outcome or PRO.

**chart-abstracted measure evidence can be applied to emeasure

1b. Performance Gap

Comments: **performance is high, so not much gap; theoretical gap for women and minorities, but not shown in data from this measure (not available yet), nor from the traditional version of measure

**Performance data on the measure was provided which seem to demonstrate a gap in care in which demonstrated improvement over time which should warrant a national performance measure. It did not measured by population subgroups so it did not demonstrate disparities in care other than clinically but did attach a summary of data that favorably addresses the issue of disparities.

**performance data provided; no disparities info

1c. High Priority (previously referred to as High Impact)

Comments: **Not applicable

**nA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart abstracted measure from which this measure is derived (NQF measure #0439).

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment

2a2. Reliability Testing Testing attachment

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 28 synthetic records created in the BONNIE testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Guidance from the Reliability Algorithm Precise specifications (Box 1) →empiric reliability testing as specified (Box 2) → empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→Assessed the measure logic only (Box 11) →Low certainty or confidence data used in measure are

valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- o *Is the test sample adequate to generalize for widespread implementation?*
- o *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Question for the Committee:

- o *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

- ☐ **Face validity only**
- ☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 28 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.
- The numerator, denominator, exclusions/exceptions, and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little to no room for improvement?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box2) → empirical testing of data elements using BONNIE tool (Box 3,10) →Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **The issue with validity rests with the fact that this measure is intended for electronic submission but, to date, there is no performance data on such submissions. The validity on the measure itself seems clear.

**No concerns

2a2. Reliability Testing

Comments: **only done with minimal bonnie data

**There is a lack of validity data with respect to electronic submission

**Data element testing assessed

2b2. Validity Testing

Comments: **no testing in real EHRs so not so clear?

**Only a lack of specific performance testing of electronic submission

**agree insufficient rating for validity

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **The minimum requirement is testing in EHR systems from more than 1 EHR vendor. Developers should test on the number of EHRs they feel appropriate. It is highly desirable that measures are tested in systems from multiple vendors.

**Again, there is a lack of reliability data to respect to electronic submission.

**testing only done at data element level; low reliability

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow, or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Is it likely the required data elements are routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **feasibility is partially justified by this measure being used to submit data in 2015; so why could not these 2015 data be used for other testing?

**No basis for evaluation

**Data available in EHR however how they are collected during care not assessed

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- o *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- o *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **CMS using currently

**The only unintended consequences that persons not in need of a statin may be prescribed same however, the advantage of statin administration posted ischemic stroke is well-documented and the measure excludes persons there is a documented reason for not prescribing statins.

**Not publicly reported but in CMS accountability program

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0074 : Chronic Stable Coronary Artery Disease: Lipid Control
- 0118 : Anti-Lipid Treatment Discharge
- 0439 : STK-06: Discharged on Statin Medication
- 1519 : Statin Therapy at Discharge after Lower Extremity Bypass (LEB)
- 0545 : Adherence to Statins for Individuals with Diabetes Mellitus

- 0543 : Adherence to Statin Therapy for Individuals with Cardiovascular Disease – CMS – no longer NQF endorsed
- 0547 : Diabetes and Medication Possession Ratio for Statin Therapy – CMS – no longer NQF endorsed
- 0639 : Statin Prescribed at Discharge – CMS – no longer NQF endorsed

Harmonization:

- #0074, #0118, and #1519 target diagnoses other than ischemic stroke or specific surgical procedures. In addition, #0074 and #0118 are provider level measures.
- #0439 and #2836 are completely harmonized to the extent possible, given the fact that the data source for #0439 is the paper medical record and the data source for #2836 is the electronic health record.
- The developer states that #0545 is not in the NQF database and does not address harmonization; however, endorsement was last renewed September 2, 2014.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0439 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to reduce patient morbidity and mortality through modification of risk factors for stroke, specifically through the use of statin medications to reduce low-density lipoprotein cholesterol (LDL-c). Statin prescribed at discharge >> decreased LDL-c >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the prevention of stroke in patients with stroke and transient ischemic attack. An elevated serum lipid level has been a well-documented risk factor for coronary artery disease (CAD). Recently, there has been an increased focus on examining the relationship between elevated lipid levels and the incidence of stroke. In particular, some recent clinical trials have analyzed the association between lipids and non-hemorrhagic stroke. The reduction of LDL cholesterol, through lifestyle modification and drug therapy, for the prevention of strokes and other vascular events is recommended for patients with CAD in the National Cholesterol Education Program Adult Treatment Panel III (NCEP ATP III) Guidelines. In addition, recent evidence from the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) trial supports the use of statins to lower LDL cholesterol in stroke patients without prior CAD and a fasting LDL >/= 100 mg/dL.

Based on these guidelines, all patients with ischemic stroke should have lipid profile measurement performed within 48 hours of admission unless outpatient results are available from within the past 30 days. Treatment for secondary prevention should be initiated in patients who meet NCEP ATP III criteria in the presence of LDL >/= 100 mg/dL, or continued for patients who were previously on lipid-lowering therapy and have an LDL< 100 mg/dL.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: The number of studies supporting the body

of evidence for statin therapy is in the thousands. A recent editorial by Lori Mosca, MD, MPH, PhD published in Journal of the American College of Cardiology (2012) noted more than 2,300 potential studies in the literature related to sex-specific outcomes and the effects of statins on the prevention of cardiovascular disease.

The Third Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III, or ATP III) extensively analyzed the results of 63 clinical trials. Findings from these studies strongly influenced the development of ATP III recommendations (2002).

To date, the single most important study of statin therapy and stroke incidence is The Stroke Prevention by Aggressive Reduction of Cholesterol Levels (SPARCL) trial. SPARCL randomly assigned 4731 patients who had had a stroke or TIA within one to six months before study entry, had low-density lipoprotein (LDL) cholesterol levels of 100 mg to 190 mg per deciliter (2.6 to 4.9 mmol per liter) and had no known history of coronary heart disease to double-blind treatment with 80 mg of atorvastatin per day or placebo. The incidence of fatal or non-fatal stroke in patients receiving atorvastatin was reduced by 16%. SPARCL is unique in that it is the only trial to study a cohort of patients with no known history of coronary heart disease.

A Cochrane Database of Systematic Review (10 August 2011) identified eight randomized control trials (RCTs) involving 625 participants. The review included all RCTs comparing statins (any type and dosage) versus placebo or no treatment, administered within two weeks of the onset of acute ischemic stroke or TIA. The search strategy included the Cochrane Stroke Group's Trials Register (November 2010); the Cochrane Central Register of Controlled Trials (CENTRAL)(The Cochrane Library 2010, Issue 4): MEDLINE (1950 to November 2010); and EMBASE (1980 to November 2010). In addition, ongoing trials and research registers (November 2010) were also searched and reference lists from relevant articles and contacted authors checked to further identify published, unpublished, and ongoing trials. Two review authors independently selected studies for inclusion and extracted data.
A MEDLINE search, using PubMed, of all literature related to "Hydroxymethylglutaryl-CoA Reductase Inhibitors/therapeutic use" was done for the years 2007 to 2012 and yielded 240 results. A meta-analysis of 12 studies (Biffi, et al., 2011), comprising 2013 statin users and 9682 non-users, investigated the association between prestroke statin use and clinical outcome. A meta-analysis of 18 RCTs (Kostis WJ, et al., 2012) of statins with sex-specific outcomes (N=141,235 participants, 40,275 2omen, 21,468 cardiovascular events, i.e., coronary heart disease and stroke) demonstrated the benefit of statins in decreasing morbid and mortal cardiovascular events in apparently healthy individual and in those with clinically evident cardiovascular disease.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting the effectiveness of statin therapy on stroke outcome is moderate. There is evidence that stain therapy in both primary and secondary prevention significantly reduces subsequent major coronary events but only marginally reduces the risk of stroke recurrence. There is no clear evidence of beneficial effect from statins in those with previous hemorrhagic stroke, and it is unclear if statins should be started immediately post stroke or later (Feher, et al., 2010).

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that stroke and TIA patients should be prescribed statin therapy for stroke prevention. No position against the importance of statin therapy for secondary stroke prevention was identified in the literature.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
Statins play an important role in brain ischemia. These drugs reduce cholesterol levels, which have been related to a reduction in vascular event risk, and also have other functions besides cholesterol metabolism, called pleiotropic effects. Statins play an important role during the acute phase of ischemia, and might have neuroprotective effects, as they act in several mechanisms during the acute phase of stroke, such as nitric oxide (NO) and glutamate metabolism, inflammation, platelet aggregation, immune responses, and apoptosis. They also have other functions which can be related, with better long-term outcome, to neurorepair mechanisms. Statins promote angiogenesis, endogenous cell proliferation, neurogenesis and new synapse formation (Rodriguez-Yáñez M, et al., 2008).

The potential positive action of stains during acute cerebrovascular ischemic event are two-fold: a neuroprotective effect, limiting damage and improving recovery; and a preventative effect on early recurrence. The SPARCL trial did report a slight increase in hemorrhagic stroke (n=55) for the atorvastatin group compared to placebo (n=33). Based on a Cochrane Review of eight RCTs of statins, no patients died from ischemic stroke or from adverse drug effects, bleeding or infections among 444 participants in six studies

where these outcomes were reported. Statin treatment did not reduce all-cause mortality compared with placebo or no treatment (OR 1.51, 95% CI 0.60 60 3.81) in the 431 patients enrolled in seven studies. No cases of rhabdomyolysis occurred in 274 patients enrolled in three studies.

Diet, exercise, and lifestyle modification are assumed to be cost-effective stroke prevention strategies; however, no specific studies on the cost-effectiveness of statin therapy for the prevention of stroke recurrence were noted in the literature. Most of the literature focuses on the primary prevention of cardiovascular disease. According to Chan and colleagues (2007) recent clinical trials have found that high-dose statin therapy, compared with conventional-dose statin therapy, reduces the risk of cardiovascular events in patients with acute coronary syndromes (ACS) and stable coronary artery disease (CAD). However, the actual benefit and cost-effectiveness of high-dose statin therapy are unknown. The daily cost difference between a high- and conventional-dose statin would need to be <$1.70, $2.65, and $3.55 to yield incremental cost-effective ratios below $50,000, $100,000, and $150,000 per quality-adjusted life year (QALY).

Another study (Lazar LD, et al., 2011), evaluated the cost-effectiveness of statin therapy for primary prevention. This study utilized the Coronary Heart Disease (CHD) Policy Model, an established computer simulation, Markov state-transition model of CHD incidence, prevalence, mortality and costs in the US population >35 years of age. Cost-savings were projected for persons with LDL > 100 mg/dL and moderately high risk, LDL > 130 mg/dL and moderate risk, and LDL > 160 mg/dL and lower or lowest risk with the cost of statins at $4/month. Using this strategy, it would be possible to prevent 14,000 CHD deaths per year and save over $1.4 billion a year compared with current levels of treatment.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: National Cholesterol Education Program, Adult Treatment Panel (ATP) III (2002). During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: The Third Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III, or ATP III) presents the National Cholesterol Education Program's (NCEP's) updated recommendations for cholesterol testing and management.
ATP III contains both evidence statements and specific recommendations based on these statements. Each evidence statement is qualified according to category of evidence (A-D) and strength of evidence (1-3), as follows:

Type of Evidence
Category and Description of Type of Evidence
A – Major randomized controlled clinical trials (RCTs)
B – Smaller RCTs and meta-analyses of other clinical trials
C – Observational and metabolic studies
D – Clinical experience

Strength of Evidence
Category and Description of Strength of Evidence
1 – Very strong evidence
2 – Moderately strong evidence
3 – Strong trend

1c.13 Grade Assigned to the Body of Evidence: A1 (Major randomized controlled clinical trials (RCTs)/Very strong evidence) // B1 (Smaller RCTs and meta-analyses of other clinical trials/Very Strong evidence)

1c.14 Summary of Controversy/Contradictory Evidence: There is some recent debate about the use of statins in women who do not have heart disease but do have high levels of cholesterol. An observational study (Culver AL, et al., 2012), involving 153,840 postmenopausal women enrolled in the Women's Health Initiative, reported a 48% greater risk of developing diabetes mellitus for women taking statin medications when compared to women not taking the medication at baseline. However, a new meta-analysis

(Kostis WJ, et al., 2012) of 18 trials with 141,235 participants concluded that statin therapy was beneficial in both the primary and secondary prevention settings for both men and women.

1c.16 Quote verbatim, <u>the specific guideline recommendation</u> *(Including guideline # and/or page #)*:
2010 Update to the AHA/ASA Recommendations for the Prevention of Stroke in Patients with Stroke and Transient Ischemic Attack,

page 233.
Class I, Level B Recommendation
Statin therapy with intensive lipid-lowering effects is recommended to reduce the risk of stroke and cardiovascular events among patients with ischemic stroke or TIA who have evidence of atherosclerosis, and LDL-c level > 100 mg/dL, and who are without known CHD.

1c.17 Clinical Practice Guideline Citation: Furie KL, Kasner SE, Adams RJ, Albers GW, et al. Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack. A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association. Stroke. 2011;42:232-33.

1c.18 National Guideline Clearinghouse or other URL: http://stroke.ahajournals.org/content/42/1/227.full.pdf

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on July 13, 2010. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A/B

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: Moderate1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0439_Evidence_MSF5.0_Data-635827722667216159.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with

significant costs. Recent guidelines recommend high-intensity statin therapy for patients with ischemic stroke unless contraindicated or patient characteristics require dosage modification.

Healthcare organizations that track this measure for internal quality improvement purposes have seen an increase in the measure rate over time. The chart-abstracted measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-6 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 979 denominator cases; 876 numerator cases; 48 hospitals; 0.89479 national aggregate rate; 0.88567 mean of hospital rates; 0.18656 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.94949 50th percentile rate/median rate; 0.85165 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2010: 12,042 denominator cases; 11,188 numerator cases; 137 hospitals; 0.92908 national aggregate rate; 0.89366 mean of hospital rates; 0.12881 standard deviation; 1.0 90th percentile rate; 0.97059 75th percentile rate/upper quartile; 0.94231 50th percentile rate/median rate; 0.86667 25th percentile rate/lower quartile; and, 0.70647 10th percentile rate.

CY 2011: 18,608 denominator cases; 17,512 numerator cases; 157 hospitals; 0.9411 national aggregate rate; 0.90293 mean of hospital rates; 0.12829 standard deviation; 1.0 90th percentile rate; 0.97297 75th percentile rate/upper quartile; 0.94361 50th percentile rate/median rate; 0.88889 25th percentile rate/lower quartile; and, 0.78571 10th percentile rate.

CY 2012: 18,998 denominator cases; 18,165 numerator cases; 157 hospitals; 0.95615 national aggregate rate; 0.9412 mean of hospital rates; 0.08087 standard deviation; 1.0 90th percentile rate; 0.99371 75th percentile rate/upper quartile; 0.96825 50th percentile rate/median rate; 0.925 25th percentile rate/lower quartile; and, 0.84375 10th percentile rate.

CY 2013: 29,350 denominator cases; 28,374 numerator cases; 262 hospitals; 0.96675 national aggregate rate; 0.9469 mean of hospital rates; 0.09876 standard deviation; 1.0 90th percentile rate; 0.99649 75th percentile rate/upper quartile; 0.97938 50th percentile rate/median rate; 0.94444 25th percentile rate/lower quartile; and, 0.86585 10th percentile rate.

CY 2014: 140,296 denominator cases; 136,545 numerator cases; 1296 hospitals; 0.97326 national aggregate rate; 0.95761 mean of hospital rates; 0.08458 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98507 50th percentile rate/median rate; 0.95303 25th percentile rate/lower quartile; and, 0.89474 10th percentile rate.

1b.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability.** *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.

According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al., 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Differences in access to and use of stroke prevention therapies in all racial and ethnic groups has been poorly documented and understudied; however, one study of 5840 stroke survivors as part of the National Health Interview Survey, found that women, blacks

or African Americans, and the poor were significantly less likely to fill prescriptions because of costs. Disparities are reduced when patients have health insurance and ready access to care.

According to the literature, minorities are less likely to receive medications for secondary prevention, including statin therapy for hyperlipidemia (Cruz-Flores, et al., 2011). Yood and colleagues (2006) found that blacks or African Americans newly diagnosed with dyslipidemia and prescribed statins were 36% less likely to achieve low-density lipoprotein goals over time (hazard ration 0.64, 95% CI O.61 to 0.68). This disparity persisted after low-density lipoprotein testing and adjustment for statin adherence (hazard ration 0.60, 95% CI 0.57 to0.63). Another study by Mark and associates (2007) noted that blacks or African Americans were less likely than whites to be switched between lipid-lowering agents (OR 0.68 95% CI 0.60 to 0.78), to have treatment adjusted (OR 0.53, 95% CI 0.43 to 0.66), or to be prescribed higher medication dosages (OR 0.75, 95% CI 0.67 to 0.84).

Since the last endorsement date, Schwamm and colleagues (2010) found that black patients with stroke received fewer evidence-based care processes than Hispanic or white patients. Lipid-lowering therapy at discharge for patients with low-density lipoprotein (LDL) > 100, or those on lipid-lowering agents before hospital admission, or in whom LDL was not measured in the past 30 days, was one care process evaluated in this study. Blacks had lower odds relative to white patients of receiving lipid therapy at discharge after adjustment for both patient and hospital level variables: OR 0.91 [95% CI 0.88-0.96]

A more recently published study (Qian F, et al, 2013) from GWTG also noted statistically significant (P<0.01) racial and ethnic disparities for lipid-lowering therapy at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for lipid-lowering medication prescribed at discharged : non-Hispanic White (n=170,694) 84.3%; non-Hispanic Black (n=20,514) 83.8%; Hispanic (n=6632) 85.8%; and non-Hispanic Asian American (n=3060) 86.7%.

2014 data from the Paul Coverdell National Acute Stroke Registry (PCNASR) reported greater disparity for women (95.9%) compared to men (97.0%) prescribed statin therapy at discharge. Similar rates of statin therapy prescribed at discharge were reported for white patients (96.3%) and other races (96.7%); aggregate rate 96.4%; n=45,249 (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths in 2008 (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 (P<0.05).168 (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

According to the Third Report of the National Cholesterol Education Program (NCEP) Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III/ATP III) (National Institutes of Health, 2002), statins should be considered as first-line drugs when LDL-lowering drugs are indicated to achieve LDL treatment goals. HMG CoA reductase inhibitors (statins) are powerful LDL-lowering drugs. Statin therapy reduces the risk of acute coronary syndromes, coronary procedures, and other coronary outcomes in both primary and secondary prevention. It also reduces the risk of stroke in secondary prevention.

The Stroke Prevention by Aggressive Reduction of Cholesterol Levels (SPARCL) trial (Amarenco, P, et al., 2006) concluded that in patients with recent stroke or TIA and without known coronary heart disease, 80 mg of atorvastatin per day reduced the overall incidence of strokes and cardiovascular events, despite a small incidence of hemorrhagic stroke. The trial randomly assigned 4731 patients who had had a stroke or TIA within one to six months before study entry, had low-density lipoprotein (LDL) cholesterol levels

of 100 to 190 mg per deciliter (2.6 to 4.9 mmol per liter), and had no known coronary heart disease to double-blind treatment with 80 mg of atorvastatin per day or placebo. The primary end point was a first nonfatal or fatal stroke. The mean LDL cholestrerol level during the trial was 73 mg per deciliter (1.9 mmol per liter) among patients receiving atorvastatin and 129 mg per deciliter (3.3 mmol per liter) among patients receiving placebo. During a median follow-up of 4.9 years, 265 patients (11.2 percent) receiving atorvastatin and 311 patients (13.1 percent) receiving placebo had a fatal or nonfatal stroke (5-year absolute reduction in risk, 2.2 percent; adjusted hazard ratio, 0.84; 95 percent confidence interval, 0.71 to 0.99; P=0.03; unadjusted P=0.05) The atorvastatin group had 218 ischemic strokes and 55 hemorrhagic strokes. The five-year absolute reduction in the risk of major cardiovascular events was 3.5 percent (hazard ratio, 0.80; 95 percent confidence interval, 0.69 to 0.92; P=0.002). The overall mortality rate was similar, with 216 deaths in the atorvastatin group and 211 deaths in the placebo group (P=0.98), as were the rates of serious adverse events. Elevated liver enzyme values were more common in patients taking atorvastatin.

In 2013, the American College of Cardiology (ACC) / American Heart Association (AHA) updated the Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults, and strongly recommended high-intensity statin therapy for secondary prevention in patients with clinical atherosclerotic cardiovascular disease (ASCVD), unless contraindicated. Patients with ischemic stroke due to atherosclerosis are included in this first of four statin benefit groups. High-intensity statin therapy should be initiated or continued as first-line therapy in both women and men =75 years. When high-intensity statin therapy is contraindicated or for those patients unable to tolerate high-intensity statin therapy, moderate-intensity statin therapy should be used as a second option. High-intensity therapy may also be reasonable for ischemic stroke patients > 75 years, if risk-reduction benefits outweigh the risk of adverse events and the patient can tolerate it (Stone NJ, et al, 2013). AHA/ASA Guidelines for the Prevention of Stroke in Patients with Stroke or Transient Ischemic Attack (Kernan WN, et al, 2014) were revised the following year to align with 2013 ACC/AHA recommendations. Statin therapy was recommended to reduce the risk of stroke and cardiovascular events for patients with ischemic stroke or TIA presumed to be of atherosclerotic origin and LDL > 100 with or without evidence for other ASCVD, as well as, patients with LDL < 100 and no evidence for other clinical ASCVD.

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*

Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK-6_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** DischargedonStatinMedication_v4_Wed_Apr_01_12.18.50_CDT_2015.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Patients prescribed statin medication at hospital discharge.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Statin Medication
- Statin Medication is represented with the QDM datatype and value set of Medication, Discharge: Statin (OID: 2.16.840.1.113883.3.117.1.7.1.225)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Patients with a principal diagnosis of ischemic stroke.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke

- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
Denominator Exclusions:
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients with comfort measures documented.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care
Patients with an LDL-c of less than 70 mg/dL <30 days prior to arrival or any time during the hospital stay

Denominator Exceptions:
Patients with a reason for not prescribing statin medication at discharge.

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Denominator Exclusion Data Elements:

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

Discharge Status (modeled as Attributes of the above Non-Elective Inpatient Encounter)

- Discharge status: Left Against Medical Advice (OID: 2.16.840.1.113883.3.117.1.7.1.308)
- Discharge status: Patient Expired (OID: 2.16.840.1.113883.3.117.1.7.1.309)
- Discharge status: Discharge To Acute Care Facility (OID: 2.16.840.1.113883.3.117.1.7.1.87)
- Discharge status: Discharged to Home for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.209)
- Discharge status: Discharged to Health Care Facility for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.207)

Comfort Measures

- Comfort Measures are represented with the QDM datatypes and value set of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Emergency Department Visit

- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

LDL-c

- LDL-c is represented with the QDM datatype and value set of Laboratory Test, Performed: LDL-c (OID: 2.16.840.1.113883.3.117.1.7.1.215)

Denominator Exceptions Data Elements:

Reasons for Not Prescribing Statin Medication

- Statin Allergy is represented with the QDM datatype and value set of Medication, Allergy: Statin Allergen (OID: 2.16.840.1.113883.3.117.1.7.1.423)
- Statin Ingredient Specific Medication is represented with the QDM datatype and value set of Medication, Discharge: Statin ingredient specific (OID: 2.16.840.1.113762.1.4.1021.7)
- Medical Reason is represented with the QDM datatype and value set of Medication, Discharge not done: Medical Reason (OID: 2.16.840.1.113883.3.117.1.7.1.473)
- Patient Refusal is represented with the QDM datatype and value set of Medication, Discharge not done: Patient Refusal (OID: 2.16.840.1.113883.3.117.1.7.1.93)

Non-Elective Inpatient Encounter

- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. Stratification Details/Variables *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. Risk Adjustment Type (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. Identify the statistical risk model method and variables *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable.

S.15. Detailed risk model specifications *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. Detailed risk model specifications (*if not provided in excel or csv file at S.2b*)
Not applicable.

S.16. Type of score:
Rate/proportion
If other:

S.17. Interpretation of Score *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable.

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record, Electronic Clinical Data : Imaging/Diagnostic Study, Electronic Clinical Data : Laboratory, Electronic Clinical Data : Pharmacy

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0439_CMS105v3_STK6_Bonnie_Testing.xlsx,STK6_eCQM_testing_attachment.docx

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b7)

Measure Number (*if previously endorsed*)**:** 2836
Measure Title: STK-06: Discharged on Statin Medication
Date of Submission: 1/14/2016
Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]
AND
If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are

present at start of care; [14,15] and has demonstrated adequate discrimination and calibration
OR
- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful** [16] **differences in performance**;
OR
there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes
10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).
11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.
12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.
13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.
14. Risk factors that influence outcomes should not be specified as exclusions
15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE
Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure. Testing must be provided for all the sources of data specified and intended for measure implementation.* ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**

☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: (*must be consistent with levels entered in item S.26*)	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

28 unique synthetic patient records were created in the BONNIE testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and lab results were pre-determined to provide a variety of scenarios that adequately tested for patients passing each data element and failing each data element. Data included in cases and tested for this measure included

diagnoses, medications, laboratory results, discharge statuses, patient orders, age, length of stay, and ED and inpatient encounters.

All 28 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

Note*: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)

☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #0439 STK-06: Discharged on Statin Medication, from which this measure is derived.

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with data transmission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of patient records over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rate of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

This measure was re-tested in 2010-2011 (n=33), following modification of the measure to focus specifically on statin medications (as opposed to the more general designation of lipid lowering medications, as had been originally tested). Retrospective comparison of vendor re-abstracted data and data submitted to The Joint Commission warehouse by the healthcare organization revealed zero defects. The agreement rate was 100% for all STK-6 Discharged on Statin Medication data elements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures). The following is a list of the major tests done on the submitted ORYX data:

- Transmission of complete data
- Usage of data received: To understand if the HCO provides the relevant service to treat the relevant population
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors as outlined in the contract is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the chart-abstracted version of this measure for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 96.7%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-6.

Data Elements	Total 'n' numerator	Total 'n' denominator	Rate
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
LDL-c Greater Than or Equal to 100 mg/dL	363	380	95.5%
LDL-c Measured Within the First 48 Hours or 30 Days Prior to Hospital Arrival	434	463	93.7%
Pre-Arrival Lipid-Lowering Agent	426	464	91.8%
Reason for Not Prescribing Statin Medication at Discharge	91	99	92.0%
Statin Medication Prescribed at Discharge	416	441	94.3%

These agreement rates are considered to be well within acceptable levels.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i*.e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

- ☒ **Critical data elements** (*data element validity must address ALL critical data elements*)
- ☒ **Performance measure score**
  - ☐ **Empirical validity testing**
  - ☒ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic stroke pass and fall into the measure. We have created negative test cases, testing to ensure patients without a principal diagnosis of ischemic stroke do not fall into the denominator.

Numerator test cases positively test to ensure patients receiving statin medication at discharge fall in to the measure. Negative test cases ensure that a patient who does not receive statin at discharge do not fall in to the numerator population.

Denominator exclusion and exception test cases for this measure ensure that patients are properly removed from the denominator if they have comfort measures, specific discharge statuses other than discharged home, and medical reasons or patient refusal for not receiving statin therapy. Negative test cases are also run. For example, cases with comfort measures ordered but not within the specified time frame are expected to fail, and should not be removed from the denominator. Testing confirmed patients meeting the exclusion and exception criteria are removed from the measure appropriately, while those that do not meet the criteria are retained in the denominator population.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

_____

2b3. EXCLUSIONS ANALYSIS

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a length of stay (LOS) greater than 120 days
3. Patients with Comfort Measures Only documented
4. Patients enrolled in clinical trials
5. Patients admitted for Elective Carotid Intervention
6. Patients discharged to another hospital (acute care facility)
7. Patients who left against medical advice
8. Patients who expired
9. Patients discharged to home for hospice care
10. Patients discharged to a health care facility for hospice care
11. Patients with a documented Reason For Not Prescribing Statin Medication at Discharge

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Comfort Measures Only
Overall Occurrence n = 163,225
Overall Occurrence Percentage: 10.4%
Minimum: 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Patients with a documented Reason For Not Prescribing Statin Medication at Discharge
Overall Occurrence n = 13,297
Overall Occurrence Percentage: 4.2%
Minimum: 0.24%
10th Percentile: 1.11%
Median: 3.31%
90th Percentile: 10.5%
Maximum: 29.7%

Exclusion: Discharge Disposition - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage: 35.7%
Minimum: 0.787%
10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: Discharge Disposition - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage: 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%

90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: Discharge Disposition - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage: 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: Discharge Disposition - Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage: 52.2%
Minimum: 6.25%
10th Percentile: 39%
Median: 51.9%
90th Percentile: 64%
Maximum 94.3%

Exclusion: Discharge Disposition - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage: 3%
Minimum: 0.169%
10th Percentile: 0.87%
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-asbtracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i*.e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE
2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence

interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0439: STK-6 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	152	0.92074	0.14322	1	1	0.96214	0.9	0.82353
2Q2011	155	0.90883	0.16942	1	1	0.95833	0.9125	0.77778
1Q2011	159	0.87312	0.18575	1	1	0.9375	0.84615	0.6
4Q2010	136	0.87766	0.17491	1	0.98626	0.93333	0.83667	0.69231
3Q2010	126	0.89971	0.17615	1	1	0.96	0.9	0.7
2Q2010	117	0.90979	0.15111	1	1	0.96667	0.88889	0.72727
1Q2010	97	0.9034	0.15012	1	1	0.95652	0.875	0.67273
4Q2009	48	0.88567	0.18656	1	1	0.94949	0.85165	0.66667

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i.*e., what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS
***If only one set of specifications, this section can be skipped*.**

Note: *This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i.*e., what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual performance (whether or not the case fails) is compared to expectations to ensure missing data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score)

If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*
ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**
Attachment **Attachment:** STK6_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**
IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.
Not applicable.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.
Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. **Current and Planned Use**
NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://jointcommission.org EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentiveprograms

4a.1. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

- Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
- Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

- Name of program and sponsor Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable.

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable.

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance

results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures

Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0074 : Chronic Stable Coronary Artery Disease: Lipid Control
0118 : Anti-Lipid Treatment Discharge
0439 : STK-06: Discharged on Statin Medication
0543 : Adherence to Statin Therapy for Individuals with Cardiovascular Disease
0545 : Adherence to Statins for Individuals with Diabetes Mellitus
0547 : Diabetes and Medication Possession Ratio for Statin Therapy
0639 : Statin Prescribed at Discharge
1519 : Statin Therapy at Discharge after Lower Extremity Bypass (LEB)

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0543 : Adherence to Statin Therapy for Individuals with Cardiovascular Disease; Centers for Medicare and Medicaid Services
0545 : Adherence to Statins for Individuals with Diabetes Mellitus – measure not in NQF database
0547 : Diabetes and Medication Possession Ratio for Statin Therapy; CMS
0639 : Statin Prescribed at Discharge; CMS

5a. Harmonization

The measure specifications are harmonized with related measures;

OR

The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**

Are the measure specifications completely harmonized?

No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**

Three statin therapy measures were identified from the NQF database. All three measures address target diagnoses other than ischemic stroke or specific surgical procedures for patients 18 years or older: 0074 Coronary Artery Disease; 0118 isolated Coronary Artery Bypass Graft (CABG); and, 1519 Lower Extremity Bypass (LEB). Measure 1519 addresses inpatient organizational performance. The other two measures, 0074 and 0118 are provider-level measures in the ambulatory care setting. NQF# STK-06: Discharged on Statin Medication: The measures are completely harmonized to the extent possible, given the fact that the data source for #0439 is the paper medical record, and the data source for #2836 is the electronic health record.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);

OR

Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**

Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)

Not applicable.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 2837
Measure Title: STK-10: Assessed for Rehabilitation
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic or hemorrhagic stroke patients assessed for or who received rehabilitation services during the hospital stay. This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, and STK-8: Stroke Education) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is a leading cause of serious, long-term disability, associated with significant costs. The primary goal of rehabilitation is to prevent complications, minimize impairments, and maximize function. Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.

Healthcare organizations that track rehabilitation assessments for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-asbtracted measure has been included in the Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvement in quality at the national level.

Numerator Statement: Ischemic or hemorrhagic stroke patients assessed for or who received rehabilitation services.
S.7. **Denominator Statement:** Patients age 18 and older discharged from inpatient care (non-elective admissions) with a principal diagnosis of ischemic or hemorrhagic stroke and a length of stay less or equal to 120 days.
S.10. **Denominator Exclusions:** Patients with comfort measures documented
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care
Denominator Statement:
Denominator Exclusions:

New Measure -- Preliminary Analysis

Criteria 1: Importance to Measure and Report

1a. Evidence

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary

Evidence for this new eMeasure is the same as the existing measure #0441 STK 10: Assessed for Rehabilitation:

- Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.
- AHA/ASA-Endorsed Management of Adult Stroke Rehabilitation Care: A Clinical Practice Guideline (2005).
  - Level I Evidence, Recommendation A - Organized and coordinated post-acute inpatient rehabilitation care improves outcome (page e-120).
  - Strongly recommend that once the patient is medically stable, the primary physician consult rehabilitation services (i.e., physical therapy, occupational therapy, speech and language pathology, kinesiotherapy, and physical medicine), as indicated, to assess the patient's rehabilitation needs and to recommend the most appropriate setting to meet those needs (page e-119).
  - The 2012 Committee expressed no concerns regarding the evidence underlying this measure.

Exception to evidence

Not applicable

Questions for the Committee:

- *The developer attests the underlying evidence for the measure #0441 (chart-abstracted version) has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure, therefore there is no need for repeat discussion and voting on Evidence?*

Guidance from the Evidence Algorithm: Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: Moderate; Consistency: Moderate/High (Box 5) → Box 5b Moderate

Preliminary rating for evidence: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**
Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer states no performance data for the electronic version of this measure are yet available.
- This eCQM is currently included in the Hospital Inpatient Quality Reporting Program (IQR) and EHR Incentive program.
  - In CY2016, CMS is requiring organizations participating in HIQR to electronically submit one quarter of

data on 4 of 28 available eCQMs. This measure is one of the 28 eCQMs.

- The developer also provided performance data from the chart abstracted measure which seems to be very high with little to no room for improvement.

Disparities

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Is there a gap in care that warrants a national performance eMeasure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **the measure is consistent with a number of stroke guidelines and is supported the body of evidence reflects upon studies that focused on coordinating or stroke ward care. Quality of evidence is moderate at max. Performance metric is the logical category

**this is a process measure that is well captured. It captures the desired factor - eval for rehabilitation services

**Evidence supports Emeasure

**The evidence basis for the chart-abstracted measure has not changed and can be applied to the eMeasure.

**No vote - same as 0441.

1b. Performance Gap

Comments: **performance data has been measured and appears achievable-- perhaps however at a ceiling effect. CMS is requiring this metric

Prior measures have shown this measure to be robust from a compliance perspective

**yes performance measures shown has grown and hospital performance improved. One concern is the ceiling effect that we may reach

**No performance data on this emeasure but high participation on chart abstracted data.

**There is a gap in care that warrants a national performance eMeasure. Many studies are cited that illustrate disparities in access to and utilization of rehabilitation services based on demographic characteristics, including age and race. This measure could be used to micro-segment the stroke population by demographic characteristics to illustrate opportunities to mitigate disparities in access to and utilization of rehabilitation services following stroke.

**Very high performance from chart version - little opportunity to improve.

There are disparities in care stroke and outcome, but no data presented regarding impact of assessment for rehabilitation prior to discharge.

1c. High Priority (previously referred to as High Impact)

Comments: **I do not think weighted rules are in place however, such a factor would be helpful if function becomes one of the weighted factors

**The stated metric is logical-- we are not as clear as to how it would fit into the overall 8 factor construct however it appears to be linked with 5 other performance metrics linked to better outcome

**NA

**N/A

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): Electronic Clinical Data, Electronic Health Record (EHR), Imaging/Diagnostic Study, Laboratory Data, and Pharmacy Data. This is an eMeasure.

Specifications:

- HQMF specifications for eMeasure are included in the document set on SharePoint. See eMeasure Technical Review below.
- The developer states that changes have been made to the eCQM specifications to reflect revisions to the chart abstracted measure from which this measure is derived (NQF measure #0441).

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

eMeasure Technical Advisor review:

Submitted measure is an HQMF compliant eMeasure	The submitted eMeasure specifications follow the industry accepted format for eMeasure (HL7 Health Quality Measures Format (HQMF)). **HQMF specifications** ☒ **Yes** ☐ **No**
Documentation of HQMF or QDM limitations	N/A – All components in the measure logic of the submitted eMeasure are represented using the HQMF and QDM;
Value Sets	The submitted eMeasure specifications uses existing value sets when possible and uses new value sets that have been vetted through the VSAC
Measure logic is unambiguous	Submission includes test results from a simulated data set demonstrating the measure logic can be interpreted precisely and unambiguously Demonstrated through Bonnie testing
Feasibility Testing	The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible. This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.

2a2. Reliability Testing Testing attachment

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high

proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☐ **Yes** ☒ **No**

Method(s) of reliability testing:

- Dataset used for testing included 24 synthetic records created in the BONNIE testing system. Measure not tested in EHR.
- Data element validity testing was performed and will count for data element reliability as well – see validity testing section.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results from the Bonnie tool demonstrate sufficient reliability so that differences in performance can be identified?*

Guidance from the Reliability Algorithm: Precise specifications (Box 1) →empiric reliability testing as specified (Box 2) → empiric validity testing of patient-level data (Box 3) → YES: Use rating from validity testing of patient-level data elements (Box 10)→Assessed the measure logic only (Box 11)→Low certainty or confidence data used in measure are valid (Box 12b)→Low (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

2b. Validity

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

SUMMARY OF TESTING

Validity testing level ☐ **Measure score** ☒ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**

☒ **Empirical validity testing of the measure score**

Validity testing method:

- The Bonnie testing tool and environment with 24 synthetic patient records were used to test the measure logic and value sets. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure.

- The numerator, denominator, exclusions/exceptions, and logic statement were tested to confirm actual results met expectations.
- The developer also conducted a review of the measure specifications to confirm the measure logic was properly expressed with the current version of the QDM and that the logic matches the clinical intent of the measure.

Validity testing results:

- The testing results from the Bonnie tool reached 100% coverage and confirmed there was a test case for each pathway of logic (negative and positive test cases).
- The measure also had a 100% passing rate which confirmed that all the test cases performed as expected.
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.

2b3-2b7. Threats to Validity

2b3. Exclusions:

- The developer submitted additional information on exclusions and meaningful differences.

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Is it reasonable to assume that the impact of the exclusions will be similar for the eMeasure and the chart-abstracted measure?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- The developer submitted additional information on exclusions and meaningful differences.

Question for the Committee:

- *For meaningful differences in the chart-abstracted measure the developer refers to the performance scores over time. Does the SC think the eMeasure will demonstrate similar results to the chart-abstracted measure which show little to no room for improvement?*

2b6. Comparability of data sources/methods: Not applicable

2b7. Missing Data

- The developer describes the handling of missing data but does not provide information on the frequency of missing data or potential impact on measure results due to limited testing abilities using the Bonnie tool.

Guidance from Validity Algorithm: Specifications consistent with evidence (Box 1) → threats to validity empirically assessed to some extent (Box 2) → empirical testing of data elements using BONNIE tool →Moderate

Preliminary rating for validity: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **the measure appears to be consistent with the evidence

**I think it is reasonable from a validity perspective and we note that the exclusions are reasonable and reflect factors

**No concerns

**The specifications are consistent with the evidence.

**Data elements here are clear as well.

2a2. Reliability Testing

Comments: **The validity is established with this subset metrics

**Validity testing suggests a relationship with 6 other stroke metrics that are associated with high quality

**Data element testing done, no face validity testing done

**The sample of 24 is not adequate to generalize for widespread implementation. A larger sample from the Bonnie tool would demonstrate greater validity.

**24 synthetic tests - similar to chart data. No face validity included. While the results of these tests are positive the numbers are smaller than would have been desired. In the end the question is whether the assessments actually results in the prompt and proper rehabilitation and whether that actually improves the recovery and quality of life.

2b2. Validity Testing

Comments: **No

**Missing data is small and the exclusions are logical and do not appear to be a threat to the validity

**Threats to validity were not addressed

**Missing data is small and not identified as a threat to validity.

**One could easily look for much more data - including disparity data. The limited data provide many varieties of data that might be of interest and identify additional subtleties in the relationship of assessment and rehabilitation.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **I need further clarity in this area ie what is expected

**Inter rater between hospitals appears to be reliability is 98.3%

**Low reliability

**The sample of 24 is not adequate to generalize for widespread implementation. A larger sample from the Bonnie tool would demonstrate greater reliability.

**No data regarding consistency of application. Are there different assessments, are they performed with consistency?

Criterion 3. Feasibility

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is EHR; all data elements are in defined fields in EHR.
- The submission contains a feasibility assessment that addresses data element feasibility and follow-up with the measure developer indicates that the measure logic is feasible.
- This is a legacy eMeasure included in the Meaningful Use program. The developer submitted Bonnie testing results to establish feasibility, and provided an interpretation of the testing process and results in the measure testing attachment.
- Per developer, they were unable to directly assess data accuracy of the data elements in an EHR system. Workflow, or the degree to which the data elements are captured during the course of care was also not assessed.

Questions for the Committee:

- *Is it likely the required data elements are routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*
- *Does the eMeasure Feasibility Score Card demonstrate acceptable feasibility in multiple EHR systems and sites?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **the measure is very feasible to collect as evidenced by compliance data

**the national rate of reporting is 98.7% thus the metric is feasible

**Acceptable

**All data elements are available in the EHR. It is likely that the required data elements are routinely generated and used during care delivery. The data collection strategy is ready to be put into operational use. The eMeasure Feasibility Score Care demonstrates acceptable feasibility in multiple EHR systems and sites.

**Since the data should all be available electronically this should be very feasible. Quality of data in the EHRs is always a questions, as is compatibility of various EHR systems.

Criterion 4: Usability and Use

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☐ **Yes** ☒ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- CMS Hospital Inpatient Quality Reporting Program (IQR)/EHR Incentive Program: The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates. The EHR Incentive Program provides incentive payments to promote the adoption and meaningful use of interoperable HIT and qualified EHRs.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer states that while the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are currently available.
- In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs, one of which is this measure. Data will be accepted through February 28th, 2017.

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*

○ *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **the measure is reported in an identifiable and usable manner

**the metric is reported in CMS compare, and in various stroke registers as well as the JCAHO annual report

**No performance data available; benefits outweigh unintended consequences

**The performance results can be used to further the goal of high-quality, efficient healthcare by measuring conformance to this process measure that has evidence to support improved outcomes for stroke patients. No unintended consequences are identified.

**Data will be publicly reported - the real use of the data will be the demonstration of the value of the assessment and subsequent rehabilitation on the patient recovery and quality of life.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0244 : Stroke and Stroke Rehabilitation: Rehabilitation Services Ordered
- 0441 : STK-10: Assessed for Rehabilitation

Harmonization:

- The developer states NQF#0244 focuses on rehabilitation orders written prior to hospital discharge and not the rehabilitation assessment or services received by the patient. NQF#0441:STK-10 Assessed for Rehabilitation. The measures are completely harmonized to the extent possible, given the fact that the data source for #0441 is the paper medical record, and the data source for #2837 is the electronic health record.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0441 **NQF Project:** Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.
(evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent complications, minimize impairments, and maximize function post stroke by assessing the patient's need for rehabilitation services and/or initiating rehabilitation.
Assessed for rehabilitation need >> rehabilitation services received >> improved neurological outcomes >> decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the adult stroke rehabilitation care guidelines developed for the Veterans Health Administration and Department of Defense Medical Systems and endorsed by the American Heart Association/American Stroke Association (2005). Guideline recommendations incorporated information from existing evidence-based guidelines from the Agency for Health Care Policy and Research (AHCPR) Post-Stroke Rehabilitation (1995), the Scottish Intercollegiate Guidelines Network (SIGN) Management of Patients with Stroke (1997), and the Royal College of Physicians (RCP) National Clinical Guidelines for Stroke (2000).

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: According to the 2011 update from the Evidence-Based Review of Stroke Rehabilitation (EBRSR), 2000 studies including 1, 078 randomized control trials (RCTs) have been identified in the stroke rehabilitation literature. The 2001 EBSRS identified five meta-analyses of the effectiveness of stroke rehabilitation:

- Langhorne, et al. (1993) – 10 RCTs conducted between 1962 and 1993. Results revealed that management of stroke patients on a stroke unit was associated with lower mortality rates than general medical wards, and a 28% reduction in the risk of death occurring in the first 17 weeks post-stroke.
- Ottenbacher and Jannell (1993) – 36 RCTs (n=3,717 patients). Patients who participated in an individualized stroke rehabilitation programs performed better than 65% of those patients in the comparison group. Greater functional improvements were observed in younger patients and those with relatively short stroke onset to rehabilitation admission intervals.
- Stroke Unit Trialists' Collaboration (2007) - 31 RCTs. Stroke unit care was associated with a significant reduction in death (OR 0.86; 95% CI 0.76-0.98; P=0.02) at a median of one-year follow-up. Stroke unit care was also associated with a significant reduction in the combined outcomes or both death or institutional care (OR 0.82; 95% CI 0.73-0.92; P=0.0006) and death or dependency (OR 0.82; CI 95% 0.73-0.92, P=0.001).
- The Canadian Coordinating Office of Health Technology Assessment (CCOHTA) (2003) – 6 RCTs (n=1,709 patients) from 1995 to July 2002. Stroke unit care was associated with a reduction in the odds of death (OR 0.60; CI 95% 0.42-0.86) an outcome recorded in all studies.
- Seenan, et al. (2007) – 18 non-randomized trials, which more closely approximate usual clinical practice. Findings reported

were similar to prior meta-analyses of RCTs. The odds of death (OR 0.79; 95% CI 0.72-0.86) and poor outcome (OR 0.87; CI 9%%0.80-0.95) were reduced for patients receiving stroke unit care compared to general medical management.

In addition, a total of 37 individual studies (14 non-randomized and 23 RCTs) of the efficacy of stroke rehabilitation were included in the review. Only the results of RCTs and quasi RCTs were used to formulate conclusions. Studies were categorized according to the type of care provided ranging from acute stroke management to settings that offered various levels of rehabilitation services (i.e., combined acute and rehabilitation stroke units, subacute rehabilitation units, and mobile stroke teams). Overall, the body of evidence strongly supports that units providing stroke rehabilitation are associated with improved functional outcomes for patients.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting stroke rehabilitation is moderate. The impact of stroke rehabilitation on outcomes has been difficult to quantify due to problems with study design and methodology (e.g., lack of randomization, inappropriate control group selection, failure to blind assessors, difficulty in controlling for all possible confounders) detected by systematic review. Furthermore, issues inherent to stroke rehabilitation, such as controlling for spontaneous neurological recovery, daily fluctuation in individual function, and difficulties measuring functional outcomes have challenged study designs. Pre-selection of patients and observer measurement bias are additional concerns when studying the impact of stroke rehabilitation on outcomes (Foley, et al, 2011).

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that rehabilitation services minimize functional impairment and improve clinical outcomes for patients following stroke. Furthermore, most stroke patients have some residual deficits following the event, and can benefit from rehabilitation services tailored to improved cognitive, speech, or motor function. Based on these findings, a rehabilitation assessment should be completed for all stroke patients prior to hospital discharge.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)***:**
There is strong evidence on the net benefits of stroke rehabilitation. The body of evidence clearly supports that stroke rehabilitation is associated with a reduction in the odds of death or dependency and the need for institutionalization. There is strong evidence that stroke rehabilitation improves functional outcomes. There is also strong evidence that stroke rehabilitation reduces mortality for a subset of more severe stroke patients.

There is no dispute that stroke represents a significant economic burden in developed countries; however, there is some uncertainty respecting the cost-effectiveness of stroke rehabilitation. Most of the studies have been conducted outside of the United States in the United Kingdom, Australia, or the Netherlands. Stroke recovery and residual disability are highly variable. Studies have ignored the contributions of family members and/or caregivers towards rehabilitative progress, and the discrete components of caregiver and associated costs are difficult to isolate.

Although findings differ, there is some evidence of the cost-effectiveness of stroke rehabilitation services. Kalra et al. (2005) found stroke unit care to be more effective than home care, and also to be of equal cost (using per patient day alive), suggesting that stroke unit care is more cost-effective than home care. Using prospectively collected data from the Stroke Care Outcome: Providing Effective Services (SCOPES) trial over six months, Moodie et al. (2007 - Australia) compared the effectiveness of stroke units, conventional care, and a mobile service. While better outcomes were noted for patients cared for in stroke units, the incremental costs were higher compared to conventional care. Saka et al. (2009 – UK) projected the cost-effectiveness of three types of care over a 10-year period: stroke units with early supported discharge (ESD), stroke units without ESD, and general medical-surgical care. Although the costs of care were greater for both stroke units when compared to general medical-surgical wards, the cost per quality-adjusted life years (QALY) was lowest for stroke units with ESD (Foley, et al., 2011).

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: The Evidence-Based Review of Stroke Rehabilitation (EBRSR) funded by the Canadian Stroke Network (CSN).

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: Canadian Stroke Network; 2010 Dec 8. p. 129-150.
Rating Scheme for the Strength of the Evidence
Summary of Definitions for Levels of Evidence*
Grade A – Criteria – Strong recommendation. Evidence from randomized controlled trials or meta-analysis of randomized controlled trials. Desirable effects clearly outweigh undesirable effects, or vice versa.
Grade B – Criteria – Single randomized controlled trial or well-designed cohort or case-control analytic study; or multiple time series or dramatic results of uncontrolled experiment. Desirable effects closely balanced with undesirable effects.
Grade C – Criteria – At least one well-designed, nonexperimental descriptive study (e.g., comparative studies, correlation studies, case studies) or expert committee reports, opinions and/or experience of respected authorities, including consensus from development and/or reviewer groups.
*Based on Guyatt GH, Cook DJ, Jaeschke R, et al. Grades of recommendation for antithrombotic agents: American College of Chest Physicians Evidence-Based Clinical Practice Guidelines (8th edition). [published erratum in Chest 2008;34:47]. Chest 2008;133(6 Suppl):123S-131S.

1c.13 Grade Assigned to the Body of Evidence: Grade A Strong Evidence

1c.14 Summary of Controversy/Contradictory Evidence: The benefits of stroke rehabilitation are obvious. No controversies over the benefits of stroke rehabilitation were noted in the literature.

1c.16 Quote verbatim, <u>the specific guideline recommendation</u> *(Including guideline # and/or page #)*:
AHA/ASA-Endorsed Management of Adult Stroke Rehabilitation Care: A Clinical Practice Guideline (2005).
Level I Evidence, Recommendation A
Organized and coordinated post-acute inpatient rehabilitation care improves outcome (page e-120).
1. Strongly recommend that once the patient is medically stable, the primary physician consult rehabilitation services (i.e., physical therapy, occupational therapy, speech and language pathology, kinesiotherapy, and physical medicine), as indicated, to assess the patient's rehabilitation needs and to recommend the most appropriate setting to meet those needs (page e-119).

1c.17 Clinical Practice Guideline Citation: Duncan PW, Zorowitz R, Bates B, Choi JY, Glasberg JJ, Graham GD, Katz RC, Lamberty K, Refer D. Management of Adult Stroke Rehabilitation Care: A Clinical Practice Guideline. Stroke. 2005;36:e100-143.

1c.18 National Guideline Clearinghouse or other URL: http://stroke.ahajournals.org/content/36/9/e100.full.pdf+html?sid=b27cb2e0-836f-4fc0-9ee0-aae14d24f3e4

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation

and any disclosures regarding bias: The Stroke Council of the American Heart Association has chosen to endorse the VA DoD guideline for stroke rehabilitation (Management of Stroke Rehabilitation. Washington, DC: VA/DoD Clinical Practice Guideline Workgroup, Veterans Health Administration, Department of Veterans Affairs and Health Affairs, Department of Defense, February 2003). The Department of Defense and Veterans Health Administration panel of experts evaluated the medical evidence according to criteria proposed by the US Preventive Services Task Force. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 **System Used for Grading the Strength of Guideline Recommendation:** USPSTF

1c.22 **If other, identify and describe the grading scale with definitions:**

1c.23 **Grade Assigned to the Recommendation:** A: A strong recommendation that the intervention is always indicated and acceptable.

1c.24 **Rationale for Using this Guideline Over Others:** The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: Moderate1c.27 Consistency: Moderate

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form

0441_Evidence_MSF5.0_Data-635827722695140517.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*

Stroke is a leading cause of serious, long-term disability, associated with significant costs. The primary goal of rehabilitation is to prevent complications, minimize impairments, and maximize function. Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.

Healthcare organizations that track rehabilitation assessments for internal quality improvement purposes have seen an improvement in the measure rate over time. The chart-asbtracted measure has been included in the Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvement in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
This measure is a legacy eCQM that is currently included in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data are yet available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28.

For more information, refer to the CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
In October, 2009, The Joint Commission added the chart-abstracted stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-10 Assessed for Rehabilitation beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 2555 denominator cases; 2473 numerator cases; 49 hospitals; 0.96791 national aggregate rate; 0.95212 mean of hospital rates; 0.07659 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.97744 50th percentile rate/median rate; 0.95 25th percentile rate/lower quartile; and, 0.85294 10th percentile rate.

CY 2010: 23,875 denominator cases; 23,144 numerator cases; 138 hospitals; 0.96938 national aggregate rate; 0.95282 mean of hospital rates; 0.06331 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.97731 50th percentile rate/median rate; 0.93333 25th percentile rate/lower quartile; and, 0.875 10th percentile rate.

CY 2011: 28,415 denominator cases; 27,731 numerator cases; 157 hospitals; 0.97593 national aggregate rate; 0.96355 mean of hospital rates; 0.06802 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98671 50th percentile rate/median rate; 0.96203 25th percentile rate/lower quartile; and, 0.89939 10th percentile rate.

CY 2012: 28,735 denominator cases; 28,272 numerator cases; 158 hospitals; 0.98389 national aggregate rate; 0.96919 mean of hospital rates; 0.06586 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98917 50th percentile rate/median rate; 0.96875 25th percentile rate/lower quartile; and, 0.92857 10th percentile rate.

CY 2013: 44,242 denominator cases; 43,527 numerator cases; 262 hospitals; 0.98384 national aggregate rate; 0.97722 mean of hospital rates; 0.05526 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99131 50th percentile rate/median rate; 0.97605 25th percentile rate/lower quartile; and, 0.95652 10th percentile rate.

CY 2014: 210,075 denominator cases; 207,311 numerator cases; 1299 hospitals; 0.98684 national aggregate rate; 0.9772 mean of hospital rates; 0.06807 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99433 50th percentile rate/median rate; 0.98 25th percentile rate/lower quartile; and, 0.94737 10th percentile rate.

1b.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability.** *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable

1b.5. **If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.**
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers,

immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages (Howard, et al., 2011).

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors. Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038) and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years if age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age: RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in
blacks or whites (Kleindorfer, et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).
Few studies have examined racial-ethnic disparities in stroke rehabilitation. Findings from the studies available are somewhat contradictory. With regard to access, a study from the Veterans Health Administration found no differences in referral to or receipt of inpatient rehabilitation (Horner RD, et al., 2003); however, another study found that urban-dwelling blacks or African Americans were more likely to be discharged from the hospital to inpatient rehabilitation facilities than whites (Gregory PC, et al, 2006). The VA study from Horner also reported that blacks or African Americans had a slightly longer time to initiation of rehabilitation that whites (4.4 days versus 3.8 days; $P<0.05$).

Other studies have evaluated the effect of the Functional Independence Measure (FIM) score on the admission of minorities to

inpatient rehabilitation facilities. No consistency of findings has been noted. A retrospective cohort study from Bhandari, et al. (2005) found no racial differences in admission FIM scores, but several other studies reported significant differences. One large study involving urban participants hospitalized at a county hospital reported that Hispanics had lower FIM scores than blacks or African Americans (Chiou-Tan FY, et al, 2006). Another study reported similar findings with whites having the highest FIM scores (Ottenbacher KJ, et al., 2008).

Rehabilitation length of stay has been studied with similarly inconsistent findings. One study of VA and non-VA inpatient rehabilitation facilities reported significantly longer lengths of stay for blacks or African Americans than for whites (Stineman MG, 2001). Another study from CDC (2007) using data from the BRFSS found that blacks or African Americans were more likely to be referred to outpatient rehabilitation services than whites (adjusted OR 1.49; 95% CI 1.1 to 2.0).

Results on the delivery of outpatient occupational and physical therapy are also conflicting with some reporting that whites are more likely to receive therapy than non-white minorities (Mayer-Oakes SA, 1992). Another study utilizing data from the Health and Retirement Study found no racial differences among patients receiving occupational or physical therapy (Cook C, 2005). Studies from Bhandari (2005), as well as Horner (1997), reported no racial differences in the intensity of occupational or physical therapy delivered to minorities when compared to whites.

A more recently published study (Qian F, et al, 2013) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, (n=200,900), found racial disparities related to length of hospitalization and functional status. After multivariable adjustment for both patient-level and hospital-level characteristics, compared with non-Hispanic white patients, non-Hispanic black and Hispanic patients were more likely to have a longer hospital stay (i.e., length of stay greater than 4 days; black: AOR, 1.30; 95% CI, 1.22-1.39; P<0.001; Hispanic: AOR, 1.12; 95% CI, 1.02-1.23; P=0.02) and less likely to be ambulatory independent at discharge (black: AOR, 0.81; 95% CI, 0.76-0.87; P<0.001; Hispanic: AOR, 0.89; 95% CI, 0.79-0.99; P=0.04). Furthermore, non-Hispanic black patients were less likely to have a death at admission (black: AOR, 0.78; 95% CI, 0.68 to 0.89; P<0.001) or to be discharged home (black: AOR, 0.87; 95%CI, 0.81-0.94; P<0.001). Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) found that other races were somewhat more likely to be assessed for rehabilitation services (98.9%) when compared to non-Hispanic white patients (98.1%) (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, Patient/societal consequences of poor quality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths in 2008 (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 (P<0.05).168 (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

The evidence indicates that patients do better with a well-organized, multidisciplinary approach to post-acute rehabilitation after stroke. The rehabilitation team may consist of a physician, nurse, physical therapist, occupational therapist, kinesiotherapist, speech and language pathologist, psychologist, recreational therapist, patient, and family members/caregivers. If an organized rehabilitation team is not available in the facility, the evidence indicates that patients with moderate or severe symptoms should be offered a referral to a facility with such a service.

Stroke rehabilitation should begin during the acute hospitalization, as soon as the diagnosis of stroke is established and life-threatening problems are controlled. The highest priorities of early stroke rehabilitation are to prevent recurrence of stroke, manage comorbidities, and prevent complications related to immobility, dysphagia, and bowel and bladder dysfunction. Rehabilitation services may include: dysphagia treatment and management; speech therapy for communication disorders (i.e., aphasia and dysarthria) and related cognitive impairments; lower-extremity strengthening and gait training; positioning, passive stretching, range-of-motion exercises, and pharmacotherapy for patients with paretic limbs and muscle spasticity; corrective measures (e.g., splinting, serial casting, surgery) for contractures; treatment interventions for post-stroke shoulder pain; treatment for depression and other cognitive and emotional disorders; and, other services. Recently published literature emphasizes the importance of identifying and managing cognitive-communication impairments after stroke since these impairments are associated with higher rate of death and higher risk of future stroke (Hinckley, 2014).

Living with disabilities after a stroke is a lifelong challenge during which people continue to seek and find ways to compensate for or adapt to persisting neurological deficits. For many, the real work of recovery begins after formal rehabilitation when the patient attempts to use newly learned skills without the support of the rehabilitation environment or team (Bates, 2005).

1c.5. If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful. *(Describe how and from whom their input*

was obtained.)
Not applicable

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Care Coordination, Functional Status

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is an eMeasure **Attachment:** STK10_MAT.zip

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** AssessedforRehabilitation_v4_Wed_Apr_01_13.26.48_CDT_2015-1-.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Changes have been made to the eCQM specifications in order to reflect revisions to the chart abstracted measure from which this measure is derived.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic or hemorrhagic stroke patients assessed for or who received rehabilitation services.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Rehabilitation Services is represented with any one of the following QDM datatypes and value sets:
- Procedure, Performed: Rehabilitation Assessment (OID: 2.16.840.1.113762.1.4.1045.18)
- Procedure, Performed: Rehabilitation Therapy (OID; 2.16.840.1.113762.1.4.1045.19)
Encounter, Performed: Non-Elective Inpatient Encounter (discharge status: Discharged to Rehabilitation Facility)
  o Non-Elective Inpatient Encounter SNOMEDCT Value Set (2.16.840.1.113883.3.117.1.7.1.424)

o Discharged to Rehabilitation Facility SNOMEDCT Value set (2.16.840.1.113883.3.117.1.7.1.132)

Patients who Refuse Rehabilitation Assessment
Patient Refusal is represented with the QDM datatype and value sets of Procedure, Performed not done: Patient Refusal for Rehabilitation Assessment
o Rehabilitation Assessment SNOMEDCT Value set (2.16.840.1.113762.1.4.1045.18)
o Patient Refusal SNOMEDCT Value set (2.16.840.1.113883.3.117.1.7.1.308)

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Patients age 18 and older discharged from inpatient care (non-elective admissions) with a principal diagnosis of ischemic or hemorrhagic stroke and a length of stay less or equal to 120 days.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Principal Diagnosis of Ischemic Stroke
- Ischemic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Ischemic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.247)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Principal Diagnosis of Hemorrhagic Stroke
- Hemorrhagic Stroke is represented with the QDM datatype and value set of Diagnosis, Active: Hemorrhagic Stroke (OID: 2.16.840.1.113883.3.117.1.7.1.212)
- Ordinality: Principal (OID: 2.16.840.1.113883.3.117.1.7.1.14)

Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
Patients with comfort measures documented
Patients admitted for elective carotid intervention. This exclusion is implicitly modeled by only including non-elective hospitalizations.
Patients discharged to another hospital
Patients who left against medical advice
Patients who expired
Patients discharged to home for hospice care
Patients discharged to a health care facility for hospice care

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Non-Elective Inpatient Encounter
- Non-Elective Inpatient Encounter is represented with the QDM datatype and value set of Encounter, Performed: Non-Elective Inpatient Encounter (OID: 2.16.840.1.113883.3.117.1.7.1.424)
Discharge Status (modeled as Attributes of the above Non-Elective Inpatient Encounter)
- Discharge status: Left Against Medical Advice (OID: 2.16.840.1.113883.3.117.1.7.1.308)
- Discharge status: Patient Expired (OID: 2.16.840.1.113883.3.117.1.7.1.309)
- Discharge status: Discharge To Acute Care Facility (OID: 2.16.840.1.113883.3.117.1.7.1.87)
- Discharge status: Discharged to Home for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.209)

- Discharge status: Discharged to Health Care Facility for Hospice Care (OID: 2.16.840.1.113883.3.117.1.7.1.207)

Comfort Measures
Comfort Measures are represented with the QDM datatypes and value sets of:
- Intervention, Order: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)
- Intervention, Performed: Comfort Measures (OID: 1.3.6.1.4.1.33895.1.3.0.45)

Emergency Department Visit
- Emergency Department Visit is represented with the QDM datatype and value set of Encounter, Performed: Emergency Department Visit (OID: 2.16.840.1.113883.3.117.1.7.1.292)

To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at this link: https://vsac.nlm.nih.gov/.

S.12. Stratification Details/Variables *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. Risk Adjustment Type (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. Identify the statistical risk model method and variables *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable

S.15. Detailed risk model specifications *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. Detailed risk model specifications (*if not provided in excel or csv file at S.2b*)
Not applicable

S.16. Type of score:
Rate/proportion
If other:

S.17. Interpretation of Score *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. Calculation Algorithm/Measure Logic *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
See attached HQMF file

S.19. Calculation Algorithm/Measure Logic Diagram URL or Attachment *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. Sampling *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Not applicable

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
eMeasures are calculated using only the structured data collected in certified EHR technology (CEHRT). Data not present in the structured field from which the measure draws will not be included in the measure calculation.

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Electronic Clinical Data : Electronic Health Record

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Hospitals report EHR data using Certified Electronic Health Record Technology (CEHRT), and by submitting Quality Reporting Document Architecture Category 1 (QRDA-1).

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
NQF0441_CMS102v3_STK10_Bonnie_Testing.xlsx,STK10_eCQM_testing_attachment.docx

Measure Number (*if previously endorsed*)**:** 2837

Measure Title: STK-10: Assessed for Rehabilitation

Date of Submission: 1/14/2016

Type of Measure:

☐ Composite – ***STOP – use composite testing form***	☐ Outcome (*including PRO-PM*)
☐ Cost/resource	X Process
☐ Efficiency	☐ Structure

Instructions

- Measures must be tested for all the data sources and levels of analyses that are specified. ***If there is more than one set of data specifications or more than one level of analysis, contact NQF staff*** about how to present all the testing information in one form.
- **For all measures, sections 1, 2a2, 2b2, 2b3, and 2b5 must be completed.**
- **For outcome and resource use measures**, section **2b4** also must be completed.
- If specified for **multiple data sources/sets of specificaitons** (e.g., claims and EHRs), section **2b6** also must be completed.
- Respond to all questions as instructed with answers immediately following the question. All information on testing to demonstrate meeting the sub criteria for reliability (2a2) and validity (2b2-2b6) must be in this form. An appendix for *supplemental* materials may be submitted, but there is no guarantee it will be reviewed.
- If you are unable to check a box, please highlight or shade the box for your response.
- Maximum of 20 pages (*incuding questions/instructions;* minimum font size 11 pt; do not change margins). ***Contact NQF staff if more pages are needed.***
- Contact NQF staff regarding questions. Check for resources at Submitting Standards webpage.
- For information on the most updated guidance on how to address sociodemographic variables and testing in this form refer to the release notes for version 6.6 of the Measure Testing Attachment.

Note: The information provided in this form is intended to aid the Steering Committee and other stakeholders in understanding to what degree the testing results for this measure meet NQF's evaluation criteria for testing.

2a2. Reliability testing [10] demonstrates the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise. For **PRO-PMs and composite performance measures**, reliability should be demonstrated for the computed performance score.

2b2. Validity testing [11] demonstrates that the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality. For **PRO-PMs and composite performance measures**, validity should be demonstrated for the computed performance score.

2b3. Exclusions are supported by the clinical evidence; otherwise, they are supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; [12]
AND
If patient preference (e.g., informed decision-making) is a basis for exclusion, there must be evidence that the exclusion impacts performance on the measure; in such cases, the measure must be specified so that the information about patient preference and the effect on the measure is transparent (e.g., numerator category computed separately, denominator exclusion category computed separately). [13]

2b4. For outcome measures and other measures when indicated (e.g., resource use):

- **an evidence-based risk-adjustment strategy** (e.g., risk models, risk stratification) is specified; is based on patient factors (including clinical and sociodemographic factors) that influence the measured outcome and are present at start of care; [14,15] and has demonstrated adequate discrimination and calibration

OR

- rationale/data support no risk adjustment/ stratification.

2b5. Data analysis of computed measure scores demonstrates that methods for scoring and analysis of the specified measure allow for **identification of statistically significant and practically/clinically meaningful** [16] **differences in performance**;

OR

there is evidence of overall less-than-optimal performance.

2b6. If multiple data sources/methods are specified, there is demonstration they produce comparable results.

2b7. For **eMeasures, composites, and PRO-PMs** (or other measures susceptible to missing data), analyses identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and non-responders) and how the specified handling of missing data minimizes bias.

Notes

10. Reliability testing applies to both the data elements and computed measure score. Examples of reliability testing for data elements include, but are not limited to: inter-rater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing of the measure score addresses precision of measurement (e.g., signal-to-noise).

11. Validity testing applies to both the data elements and computed measure score. Validity testing of data elements typically analyzes agreement with another authoritative source of the same information. Examples of validity testing of the measure score include, but are not limited to: testing hypotheses that the measures scores indicate quality of care, e.g., measure scores are different for groups known to have differences in quality assessed by another valid quality measure or method; correlation of measure scores with another valid indicator of quality for the specific topic; or relationship to conceptually related measures (e.g., scores on process measures to scores on outcome measures). Face validity of the measure score as a quality indicator may be adequate if accomplished through a systematic and transparent process, by identified experts, and explicitly addresses whether performance scores resulting from the measure as specified can be used to distinguish good from poor quality.

12. Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, variability of exclusions across providers, and sensitivity analyses with and without the exclusion.

13. Patient preference is not a clinical exception to eligibility and can be influenced by provider interventions.

14. Risk factors that influence outcomes should not be specified as exclusions

15. With large enough sample sizes, small differences that are statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example, whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74 percent v. 75 percent) is clinically meaningful; or whether a statistically significant difference of $25 in cost for an episode of care (e.g., $5,000 v. $5,025) is practically meaningful. Measures with overall less-than-optimal performance may not demonstrate much variability across providers.

1. DATA/SAMPLE USED FOR ALL TESTING OF THIS MEASURE

Often the same data are used for all aspects of measure testing. In an effort to eliminate duplication, the first five questions apply to all measure testing. If there are differences by aspect of testing,(e.g., reliability vs. validity) be sure to indicate the specific differences in question 1.7.

1.1. What type of data was used for testing? (*Check all the sources of data identified in the measure specifications and data used for testing the measure*. *Testing must be provided for all the sources of data specified and intended for*

measure implementation. ***If different data sources are used for the numerator and denominator, indicate N [numerator] or D [denominator] after the checkbox.***)

Measure Specified to Use Data From: (***must be consistent with data sources entered in S.23***)	**Measure Tested with Data From:**
☐ abstracted from paper record	☐ abstracted from paper record
☐ administrative claims	☐ administrative claims
☐ clinical database/registry	☐ clinical database/registry
☐ abstracted from electronic health record	☐ abstracted from electronic health record
☒ eMeasure (HQMF) implemented in EHRs	☐ eMeasure (HQMF) implemented in EHRs
☒other: Bonnie Test Cases	☒ other: Bonnie Test Cases (see question 1.2)

1.2. If an existing dataset was used, identify the specific dataset (*the dataset used for testing must be consistent with the measure specifications for target population and healthcare entities being measured; e.g., Medicare Part A claims, Medicaid claims, other commercial insurance, nursing home MDS, home health OASIS, clinical registry*).

This measure is a legacy eCQM (an NQF endorsed measure that has been re-specified into an eMeasure and is currently used in a federal quality program/programs). In accordance with the modified NQF requirements for testing of eMeasures, the Bonnie testing tool was used to simulate a testing environment where measure specifications and HQMF output are tested against synthetic test data. Measure developers rely on the results in Bonnie to confirm whether the measure logic is performing as expected. Reference the eCQI Resource Center website (https://ecqi.healthit.gov/ecqm-tools/tool-library/bonnie) or the Bonnie testing tool website (https://bonnie.healthit.gov/) for more information about Bonnie functionality and its role in measure development. Please also reference the Bonnie testing worksheet attachment for detailed Bonnie test cases and testing results for this measure.

While Bonnie does consume HQMF specifications, we are not able to test the measure with data from HQMF implemented in EHRs.

1.3. What are the dates of the data used in testing? The measure specifications were tested in the Bonnie testing environment which mimics the year 2012.

1.4. What levels of analysis were tested? (*testing must be provided for all the levels specified and intended for measure implementation, e.g., individual clinician, hospital, health plan*)

Measure Specified to Measure Performance of: (***must be consistent with levels entered in item S.26***)	**Measure Tested at Level of:**
☐ individual clinician	☐ individual clinician
☐ group/practice	☐ group/practice
☒ hospital/facility/agency	☒ hospital/facility/agency
☐ health plan	☐ health plan
☐ other:	☒ other: Bonnie Test Cases

1.5. How many and which measured entities were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of measured entities included in the analysis (e.g., size, location, type); if a sample was used, describe how entities were selected for inclusion in the sample*)

Not applicable.

1.6. How many and which patients were included in the testing and analysis (by level of analysis and data source)? (*Identify the number and descriptive characteristics of patients included in the analysis (e.g., age, sex, race, diagnosis); if a sample was used, describe how patients were selected for inclusion in the sample*)

24 unique synthetic patient records were created in the BONNIE testing system for this measure. Cases were used to test the validity of each data element and timing relationship in the measure. Patient characteristics such as age, diagnosis, and discharge status were pre-determined to provide a variety of scenarios that adequately tested for patients passing each data element and failing each data element. Data included in cases and tested for this measure included diagnoses, discharge statuses, patient orders, rehabilitation assessment and therapy documentation, age, length of stay, and ED and inpatient encounters.

All 24 cases passed or failed as expected based on the data included in the case, confirming the measure logic is accurate and valid.

1.7. If there are differences in the data or sample used for different aspects of testing (e.g., reliability, validity, exclusions, risk adjustment), identify how the data or sample are different for each aspect of testing reported below.

Not applicable. Bonnie test patients were developed for use across the different aspects of testing.

1.8 What were the patient-level sociodemographic (SDS) variables that were available and analyzed in the data or sample used? For example, patient-reported data (e.g., income, education, language), proxy variables when SDS data are not collected from each patient (e.g. census tract), or patient community characteristics (e.g. percent vacant housing, crime rate).

Not applicable.

2a2. RELIABILITY TESTING

Note*: If accuracy/correctness (validity) of data elements was empirically tested, separate reliability testing of data elements is not required – in 2a2.1 check critical data elements; in 2a2.2 enter "see section 2b2 for validity testing of data elements"; and skip 2a2.3 and 2a2.4.*

2a2.1. What level of reliability testing was conducted? (*May be one or both levels*)

X **Critical data elements used in the measure** (*e.g., inter-abstractor reliability; data element reliability must address ALL critical data elements*)

☐ **Performance measure score** (e.g., *signal-to-noise analysis*)

2a2.2. For each level checked above, describe the method of reliability testing and what it tests (*describe the steps—do not just name a method; what type of error does it test; what statistical analysis was used*)

The chart-abstracted version of this measure has been in national use since the 4th quarter of 2009. At the time the chart-abstracted measure was originally tested, extensive tests of measure reliability were conducted. At present, no performance data for the electronic version of the measure are currently available. Below is the reliability testing summary for NQF #0441 STK-10 Assessed for Rehabilitation, from which this measure is derived.

Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly

basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3. For each level of testing checked above, what were the statistical results from reliability testing? (e.*g., percent agreement and kappa for the critical data elements; distribution of reliability statistics from a signal-to-noise analysis*)

Data element agreement rates reported to The Joint Commission for the chart-abstracted version of this measure for the time period of one (4Q2010 – 3Q2011) year have shown an overall agreement rate of 98.3% . This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-10.

Data Elements	Total 'n' numerator	Total 'n' denominator	Rate
Assessed for Rehabilitation			
Services	513	528	97.2%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%

These agreement rates are considered to be well within acceptable levels.

2a2.4 What is your interpretation of the results in terms of demonstrating reliability? (i.*e., what do the results mean and what are the norms for the test conducted?*)

Agreement rates for individual data elements tested for the chart-abstracted version of this measure were within acceptable levels. Once data are available for analysis, it is expected that reliability tests of the eCQM version of this measure will yield similar results.

.

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☒ **Critical data elements** (*data element validity must address ALL critical data elements*)

☒ **Performance measure score**

☐ **Empirical validity testing**

☒ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level of testing checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The Bonnie testing tool and environment were used to test the measure logic and value sets. Each data element and logic statement was tested to confirm actual results met expectations. Bonnie testing includes negative and positive testing of each data element in the measure. Positive testing ensures patients expected to be included in the measure are included. Negative testing ensures that patients who do not meet the data criteria are not included in the measure. An example of negative testing would be to include test cases with pediatric ages to ensure that pediatric patients are not included in the measure.

Denominator test cases positively test to ensure patients with principal diagnosis of ischemic or hemorrhagic stroke pass and fall into the measure. We have created negative test cases, testing to ensure patients without a principal diagnosis of ischemic or hemorrhagic stroke do not fall into the denominator.

Numerator test cases positively test to ensure patients who were either assessed for rehabilitation, received rehabilitation therapy, or were discharged to rehab are included in the numerator. Negative test cases ensure that a patient who did not receive rehabilitation services do not pass the numerator.

Denominator exclusion and exception test cases for this measure ensure that patients are properly removed from the denominator if they have comfort measures, specific discharge statuses other than discharged home. Negative test cases are also run. For example, cases with comfort measures ordered but not within the specified time frame are expected to fail, and should not be removed from the denominator. Testing confirmed patients meeting the exclusion and exception criteria are removed from the measure appropriately, while those that do not meet the criteria are retained in the denominator population.

A review of the measure specifications was also conducted to confirm the logic was properly expressed within the current version of the QDM and confirmed the logic matches the clinical intent of the measure, as stated in the measure header. This is done through use of a logic checklist to facilitate review of the measure logic, according to several checks, a few examples of which are included below:

- Is the intent of the measure described in the measure description articulated/ captured in the measure logic?
- Do the logic elements map to definitions in the measure narrative, data dictionary or supporting reference documentation?
- Do the populations in the narrative align with the populations defined in the logic?
- Are the mathematic inequalities reflective of the measure intent and represent the intended populations (for example: when intended the inequality represents less than rather than less and or equal to)?

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Bonnie results provide coverage and passing rates. This measure reached 100% coverage, confirming there is a test case for each pathway of logic. This measure also has a 100% passing rate, confirming all test cases performed as expected.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)

This measure performed as expected in Bonnie.

_____

2b3. EXCLUSIONS ANALYSIS

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

Exclusions in the eCQM align with the chart-based version of the measure, and are clinically necessary for the interpretation of the measure. As noted previously, the chart-abstracted version of this measure has been in national use since the 4th quarter of 2009, and no data are available for the eCQM version of the measure. The below analysis addresses exclusions testing performed for the chart-abstracted version of the measure from which this measure is derived.

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with Comfort Measures
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Comfort Measures Only
Overall Occurrence n = 163,225
Overall Occurrence Percentage: 10.4%
Minimum: 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%

Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for Elective Carotid Intervention
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Discharge Disposition - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage: 35.7%
Minimum: 0.787%
10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: Discharge Disposition - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage: 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: Discharge Disposition - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage: 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: Discharge Disposition - Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage: 52.2%
Minimum: 6.25%
10th Percentile: 39%
Median: 51.9%
90th Percentile: 64%
Maximum: 94.3%

Exclusion: Discharge Disposition - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage: 3%

Minimum: 0.169%
10th Percentile: 0.86%
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

Analysis of these data for the chart-abstracted progenitor of this measure indicated that all exclusions were appropriate. It is believed that results for exclusions in the eCQM will be similar when sufficient data have been received to perform such an analysis.

2b4. RISK ADJUSTMENT/STRATIFICATION FOR OUTCOME OR RESOURCE USE MEASURES
If not an intermediate or health outcome, or PRO-PM, or resource use measure, skip to section 2b5.

2b4.1. What method of controlling for differences in case mix is used?

- ☒ **No risk adjustment or stratification**
- ☐ **Statistical risk model with** Click here to enter number of factors **risk factors**
- ☐ **Stratification by** Click here to enter number of categories **risk categories**
- ☐ **Other,** Click here to enter description

2b4.2. If an outcome or resource use measure is not risk adjusted or stratified, provide rationale and analyses to demonstrate that controlling for differences in patient characteristics (case mix) is not needed to achieve fair comparisons across measured entities.

2b4.3. Describe the conceptual/clinical and statistical methods and criteria used to select patient factors (clinical factors or sociodemographic factors) used in the statistical risk model or for stratification by risk (*e.g., potential factors identified in the literature and/or expert panel; regression analysis; statistical significance of p<0.10; correlation of x or higher; patient factors should be present at the start of care*)

2b4.4a. What were the statistical results of the analyses used to select risk factors?

2b4.4b. Describe the analyses and interpretation resulting in the decision to select SDS factors (e.g. prevalence of the factor across measured entities, empirical association with the outcome, contribution of unique variation in the outcome, assessment of between-unit effects and within-unit effects)

2b4.5. Describe the method of testing/analysis used to develop and validate the adequacy of the statistical model or stratification approach (*describe the steps—do not just name a method; what statistical analysis was used*)

Provide the statistical results from testing the approach to controlling for differences in patient characteristics (case mix) below.
If stratified, skip to 2b4.9

2b4.6. Statistical Risk Model Discrimination Statistics (*e.g., c-statistic, R-squared*)**:**

2b4.7. Statistical Risk Model Calibration Statistics (*e.g., Hosmer-Lemeshow statistic*):

2b4.8. Statistical Risk Model Calibration – Risk decile plots or calibration curves:

2b4.9. Results of Risk Stratification Analysis:

2b4.10. What is your interpretation of the results in terms of demonstrating adequacy of controlling for differences in patient characteristics (case mix)? (i*.e., what do the results mean and what are the norms for the test conducted*)

2b4.11. Optional Additional Testing for Risk Adjustment (*not required, but would provide additional support of adequacy of risk model, e.g., testing of risk model in another data set; sensitivity analysis for missing data; other methods that were assessed*)

_____

2b5. IDENTIFICATION OF STATISTICALLY SIGNIFICANT & MEANINGFUL DIFFERENCES IN PERFORMANCE

2b5.1. Describe the method for determining if statistically significant and clinically/practically meaningful differences in performance measure scores among the measured entities can be identified (*describe the steps—do not just name a method; what statistical analysis was used? Do not just repeat the information provided related to performance gap in 1b)*

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

A similar methodology will be used for the eCQMs.

2b5.2. What were the statistical results from testing the ability to identify statistically significant and/or clinically/practically meaningful differences in performance measure scores across measured entities? (e.g., *number and percentage of entities with scores that were statistically significantly different from mean or some benchmark, different from expected; how was meaningful difference defined*)

NQF#0441: STK-10 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	154	0.95859	0.1098	1	1	1	0.95833	0.88889
2Q2011	155	0.95968	0.09234	1	1	1	0.95918	0.9
1Q2011	160	0.95387	0.09443	1	1	1	0.94595	0.85165
4Q2010	136	0.95043	0.11751	1	1	1	0.95339	0.85714
3Q2010	131	0.95645	0.07732	1	1	0.99038	0.95	0.87059
2Q2010	122	0.95388	0.0842	1	1	0.99403	0.94444	0.88119
1Q2010	99	0.94899	0.0808	1	1	0.98333	0.93421	0.84615
4Q2009	49	0.95212	0.07659	1	1	0.97744	0.95	0.85294

2b5.3. What is your interpretation of the results in terms of demonstrating the ability to identify statistically significant and/or clinically/practically meaningful differences in performance across measured entities? (i*.e., what do the results mean in terms of statistical and meaningful differences?*)

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. COMPARABILITY OF PERFORMANCE SCORES WHEN MORE THAN ONE SET OF SPECIFICATIONS
***If only one set of specifications, this section can be skipped*.**

Note*: This item is directed to measures that are risk-adjusted (with or without SDS factors)* ***OR*** *to measures with more than one set of specifications/instructions (e.g., one set of specifications for how to identify and compute the measure from medical record abstraction and a different set of specifications for claims or eMeasures). It does not apply to measures that use more than one source of data in one set of specifications/instructions (e.g., claims data to identify the denominator and medical record abstraction for the numerator).* ***Comparability is not required when comparing performance scores with and without SDS factors in the risk adjustment model. However, if comparability is not demonstrated for measures with more than one set of specifications/instructions, the different specifications (e.g., for medical records vs. claims) should be submitted as separate measures.***

2b6.1. Describe the method of testing conducted to compare performance scores for the same entities across the different data sources/specifications (*describe the steps—do not just name a method; what statistical analysis was used*)

Multiple data sources are not used for this measure.

2b6.2. What were the statistical results from testing comparability of performance scores for the same entities when using different data sources/specifications? (*e.g., correlation, rank order*)

Not applicable.

2b6.3. What is your interpretation of the results in terms of the differences in performance measure scores for the same entities across the different data sources/specifications? (i*.e., what do the results mean and what are the norms for the test conducted*)

Not applicable.

2b7. MISSING DATA ANALYSIS AND MINIMIZING BIAS

2b7.1. Describe the method of testing conducted to identify the extent and distribution of missing data (or nonresponse) and demonstrate that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias (*describe the steps—do not just name a method; what statistical analysis was used*)

Data not present in the structured field from which the measure draws will not be included in the measure calculation. In the Bonnie testing environment, missing data are tested as an expected "Fail" for that data element, and actual

performance (whether or not the case fails) is compared to expectations to ensure missing data impacts data element and overall measure calculation as expected. This is the extent of missing data analysis that can be performed in Bonnie.

2b7.2. What is the overall frequency of missing data, the distribution of missing data across providers, and the results from testing related to missing data? (*e.g., results of sensitivity analysis of the effect of various rules for missing data/nonresponse; if no empirical sensitivity analysis, identify the approaches for handling missing data that were considered and pros and cons of each*)

See response for question 2b7.1 above.

2b7.3. What is your interpretation of the results in terms of demonstrating that performance results are not biased due to systematic missing data (or differences between responders and nonresponders) and how the specified handling of missing data minimizes bias**?** (i.*e., what do the results mean in terms of supporting the selected approach for missing data and what are the norms for the test conducted; if no empirical analysis, provide rationale for the selected approach for missing data*)

The measure performed as expected in the Bonnie testing environment.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**
Generated or collected by and used by healthcare personnel during the provision of care (e.g., blood pressure, lab value, diagnosis, depression score)
If other:

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*
ALL data elements are in defined fields in electronic health records (EHRs)

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**
Attachment **Attachment:** STK10_eCQM_NQF_Measure_Feasibility_Assessment_Report.docx

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data**

collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.
IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.
Not applicable

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.
Value sets are housed in the Value Set Authority Center (VSAC), which is provided by the National Library of Medicine (NLM), in coordination with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services.

Viewing or downloading value sets requires a free Unified Medical Language System® (UMLS) Metathesaurus License, due to usage restrictions on some of the codes included in the value sets. Individuals interested in accessing value set content can request a UMLS license at (https://uts.nlm.nih.gov/license.html)

There are no other fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. **Current and Planned Use**
NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
Public Reporting Public Health/Disease Surveillance	Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs EHR Incentive Program https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/index.html?redirect=/ehrincentiveprograms Hospital Accreditation Program http://www.jointcommission.org

4a.1. **For each CURRENT use, checked above, provide:**

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.

Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

Name of program and sponsor: EHR Incentive Program; Centers for Medicare & Medicaid Services
Purpose: The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub.L. 111–5) was enacted on February 17, 2009. Title IV of Division B of ARRA amends Titles XVIII and XIX of the Social Security Act (the Act) by establishing incentive payments to eligible professionals (EPs), eligible hospitals, and critical access hospitals (CAHs), and Medicare Advantage Organizations to promote the adoption and meaningful use of interoperable health information technology (HIT) and qualified electronic health records (EHRs). These incentive payments are part of a broader effort under the HITECH Act to accelerate the adoption of HIT and utilization of qualified EHRs.
Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4,847 active registrations (September, 2015)

Name of program and sponsor Hospital Accreditation Program; The Joint Commission
Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

While the chart-abstracted version of this measure has indicated improvement over time, this measure is a legacy eCQM that is currently in use in the Hospital Inpatient Quality Reporting Program (HIQR) and the EHR Incentive Program. At present, no performance data for the electronic version of the measure are currently available.

In CY2016, CMS is requiring organizations participating in HIQR to electronically submit 1 quarter of data on 4 of 28 available eCQMs. This measure is one of the 28. Data will be accepted through February 28th, 2017.

For more information, refer to CY2016 IPPS Final Rule, located here: https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Regulations.html

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Not applicable

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0244 : Stroke and Stroke Rehabilitation: Rehabilitation Services Ordered
0441 : STK-10: Assessed for Rehabilitation

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0244 : Stroke and Stroke Rehabilitation: Rehabilitation Services Ordered- no longer NQF endorsed

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
NQF#0244 focuses on rehabilitation orders written prior to hospital discharge and not the rehabilitation assessment or services received by the patient. NQF#0441:STK-10 Assessed for Rehabilitation. The measures are completely harmonized to the extent possible, given the fact that the data source for #0441 is the paper medical record, and the data source for #2837 is the electronic health record.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Although both NQF#2837 STK10: Assessed for Rehabilitation and NQF#0244 target ischemic or hemorrhagic stroke patients in the acute inpatient setting, NQF#2837 is superior for two reasons. First, the numerator statement for NQF#2837 is a broader measure of quality and encompasses the total ischemic or hemorrhagic stroke inpatient population. The proportion of ischemic or hemorrhagic stroke patients who are assessed for or receive rehabilitation services during the acute inpatient hospitalization are captured in the numerator population. Patients must be assessed before services can be ordered. Rehabilitation services may be ordered but not implemented. Consequently, rehabilitation services are not received when orders are not carried out. NQF#2837 includes stroke patients who receive rehabilitation services in the numerator population. Second, NQF#0244 focuses on

rehabilitation orders written prior to hospital discharge, but capture these data after hospital discharge in the outpatient setting.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 0434
Measure Title: STK-01: Venous Thromboembolism (VTE) Prophylaxis
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic or hemorrhagic stroke patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given on the day of or the day after hospital admission.
This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Prevention of venous thromboembolism (VTE) through the use of prophylactic treatment for high-risk stroke patients is recommended by both the American Heart Association/American Stroke Association (AHA/ASA) and the American College of Chest Physicians (ACCP). Data suggest that VTE prophylaxis should be administered to stroke patients with restricted mobility soon after hospitalization. Results of studies evaluating the efficacy of VTE prophylaxis provide consistent findings of reductions in event rates by 50%-75% in most studies. These findings are quite consistent across hundreds of clinical trials and for many patient populations; placebo control groups are no longer considered ethical (Leizorovicz A, 2004).
Healthcare organizations that track VTE prophylaxis for internal quality improvement purposes have seen significant improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic or hemorrhagic stroke patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given on the day of or the day after hospital admission.
Denominator Statement: Ischemic or hemorrhagic stroke patients
Denominator Exclusions:

- Less than 18 years of age
- Length of Stay < 2 days
- Length of Stay > 120 days
- Comfort measures only documented on day of or day after hospital arrival
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence

Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012:

Results of studies evaluating the efficacy of VTE prophylaxis following stroke provide consistent findings of reductions in event rates by more than 70% (Geerts, 2001). These findings are consistent across multiple clinical trials. 2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke:

- Class I, Level of Evidence A - *Subcutaneous administration of anticoagulants is recommended for treatment of immobilized patients to prevent deep vein thrombosis. The ideal timing for starting these medications is not known.*
- Class IIa, Level of Evidence B - *The use of intermittent external compression devices is recommended for treatment of patients who cannot receive anticoagulants*.

Antithrombotic Therapy and Prevention of Thrombosis, 9th Ed: American College of Chest Physicians Evidence-Based Clinical Practice Guidelines, page 33S-34S: Grade 2B -*In patients with acute ischemic stroke and restricted mobility, we suggest prophylactic dose SC UFH or LMWH or intermittent pneumatic compression devices over no prophylaxis.*

The 2012 Committee questioned why—given that graduated compression stockings have not been shown to reduce VTE risk or death in the first seven days post-stroke—the measure isn't limited to chemoprophylaxis. The developer clarified that although graduated compression stockings (i.e., TED hose) are not sufficient for VTE prophylaxis, other mechanical devices such as pneumatic or sequential compression devices are considered appropriate for patients who are not eligible for chemoprophylaxis (although the developer acknowledged that the evidence for mechanical devices is not as strong).

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**

☐ **The developer provided updated evidence for this measure:**

Guidance from the Evidence Algorithm

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and*

there is no need for repeat discussion and voting on Evidence?

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	138	157	158	264	1299
# cases (den)	25,031	29,680	29,538	44,644	213,000
National aggregate rate	0.88	0.92	0.94	0.96	0.97
Mean hospital rate	0.83	0.88	0.92	0.95	0.96
50th percentile	0.88	0.94	0.96	0.98	0.99
10th and 90th percentiles	0.60 (10th) 0.98 (90th)	0.67 (10th) 0.996 (90th)	0.82 (10th) 0.99 (90th)	0.88 (10th) 0.99 (90th)	0.91 (10th) 1.0 (90th)

Participation in this measure has grown significantly in the past five year. Hospital performance national seems to be very high with little room for improvement.

In 2012 the Committee suggest that performance rates be reported by pharmacological vs. mechanical treatment, and for ischemic vs. hemorrhagic stroke patients.

Disparities

The developer does not provide disparities data from use of this measure. Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Data for 2014 includes 1299 hospitals. What proportion of hospitals caring for stroke patients is captured in this data?*
- *Data over five years shows significant improvement. How much further improvement in performance is likely using this measure?*
- *Is there a gap in care that warrants a national performance measure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **There is strong and compelling evidence to support the the linkage between VTE prophylaxis and improved outcomes in patients with limited mobility after stroke. The extension to all patients, as presented in the measure, has much weaker evidence. For example, the PREVAIL study limited recruitment to individuals with limited mobility, but the results were extrapolated to stroke generally.

**not aware of any new studies/information

1b. Performance Gap

Comments: **A performance gap was identified in the literature. As a maintenance measure, this measure has real world results: Hospitals that adopted the measure demonstrated a performance gap initially and improvement over time.

**performance data provided, high participation in this measure however there is no disparities data from use of the measure. If hospitals could provide disparities data, this would help further improvement.

1c. High Priority (previously referred to as High Impact)

Comments: **Not applicable.

**NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- Four data elements define the numerator and seven data elements define the denominator.
- Developer report that "Since the last endorsement date, the data element Reason for Oral Factor Xa was added to the measure logic and the algorithm revised based on Nov. 4, 2011 FDA approval of rivaroxaban for stroke prevention in patients with atrial fibrillation. Direct oral anticoagulant agents have been added to Appendix H, Table 2.1 VTE Prophylaxis Inclusion Table as they have been approved for the U.S. Food and Drug Administration."
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A.1 Table 8.1 (ischemic stroke) and 8.2 (hemorrhagic stroke).
- A Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.
- The measures is specified at the hospital level of analysis.

In the 2012 evaluation a Committee member questioned why the measure allows for an exclusion due to patient refusal. Other members noted that patients may refuse mechanical devices because they are uncomfortable.

Questions for the Committee :

- *Are the changes to the measure specifications appropriate?*
- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

For maintenance measures, summarize the reliability testing from the prior review:
Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 97.84%. Two data elements found less than 90% agreement: Reason for no VTE prophylaxis (82.2%) VTE prophylaxis (89.9%). No Kappa scores were presented.

Describe any updates to testing – no new information provided

SUMMARY OF TESTING
Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**
Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing see above

Results of reliability testing see above

Guidance from the Reliability Algorithm
Precise specifications (Box 1) →empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9)→ high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.
Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

In the 2012 evaluation the Committee questioned why both mechanical and pharmacological responses are included in the measure given the difference in evidence. The developer explained that they wanted to construct a

measure that would assess provision of appropriate therapy in all patients, and noted that pharmacological treatments are contraindicated for hemorrhagic stroke patients in the first several days post-stroke.

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

For maintenance measures, summarize the validity testing from the prior review:

1. Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test. The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant." The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
2. Ongoing feedback from measure users that is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. This measure receives more questions than other measures in the stroke set, resulting from modification to the measure following CMS alignment with similar Surgical Care Improvement Project (SCIP) VTE and VTE core measures.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

- ☐ **Face validity only**
- ☒ **Empirical validity testing of the measure score**

Validity testing method:

Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

Analysis of 1,318 hospitals and 2, 206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<000.1), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

Patients are excluded from the measure if they are under age 18, have a length of stay greater than 120 days, are receiving comfort measures only as of the day of or day after admission, enrolled in clinical trials, or are discharged within 24 hours.

New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:

- Overall exclusion for Comfort Measures Only = 4.46% (range 0.31 – 30.8%)
- Overall exclusions for elective carotid intervention = 11.8% (range 0.16-95.3%)

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:
Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.

The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: not applicable

2b7. Missing Data

The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →high confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications
Comments: **The specification measures all patients with ischemic or hemorrhagic stroke, however the evidence reviewed specified stroke patients with low mobility.
**specifications consistent with the evidence
2a2. Reliability Testing
Comments: **The measure addresses the evidence effectively however it extends the treatment beyond the evidence by not addressing the issue of mobility. Several RCTs and reviews support leave out the mobile stroke patient from studies of VTE prophylaxis.
**new validity testing demonstrates sufficient validity
2b2. Validity Testing
Comments: **Documentation of why no VTE prophylaxis is considered a positive response and is a quite permissive criterion.
**No

2b3. Exclusions Analysis
2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures
2b5. Identification of Statistically Significant & Meaningful Differences In Performance
2b6. Comparability of Performance Scores When More Than One Set of Specifications
2b7. Missing Data Analysis and Minimizing Bias
Comments: **The measure appears to be reliable, with good results for inter-rater reliability with a large N (77 hospitals, 739 patients). Overall agreement rate = 98%. Reliability was tested at the data element level.
**No need for new reliability testing

Criterion 3. Feasibility
Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available
- Some data elements are in electronic form
- The measure is in use in the Joint Commission's Stroke Certification program.
- Data collection burden is significant.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes
3b. Electronic Sources
3c. Data Collection Strategy
Comments: **The measure is quite feasible as evidenced by prior adoption.
**Multiple ways that data collection is implemented- no concerns.

Criterion 4: Usability and Use
Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure
Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**
OR
Planned use in an accountability program? ☐ **Yes** ☐ **No**

Accountability program details

- Public reporting: The measure is publicly reported on The Joint Commission's Quality Check http://www.qualitycheck.org/consumer/searchQCR.aspx and CMS's Hospital Compare https://www.medicare.gov/hospitalcompare/search.html
- Payment program: The measure is part of the Hospital Inpatient Quality Reporting Program (Hospital IQR)

Improvement results See data under gap above. The developer summarizes "The rate of VTE prophylaxis has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 97.3%. A gap of 9-10% still exists for the 10th percentile of hospitals. Modest differences in VTE prophylaxis in black patients have been reported by GWTG (Schwamm, 2010)."

Unexpected findings (positive or negative) during implementation None reported

Potential harms None reported.

Feedback loop:

- Ongoing feedback from end users to the measure developer.

***Questions for the Committee**:*

- o *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- o *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency
4b. Improvement
4c. Unintended Consequences
Comments: **The measure is usable as evidenced by prior adoption, in CY2014 it was adopted at 1,299 hospitals for 213,000 cases. This is 23% of 5627 hospitals in the US.
**Accountability is high- public reporting and Hospital IQR

Criterion 5: Related and Competing Measures

Related or competing measures

- **0240 Stroke and Stroke Rehabilitation: Deep Vein Thrombosis (DVT) Prophylaxis for Ischemic Stroke or Intracranial Hemorrhage (AMA-PCPI) –** competing measure at clinician level of analysis
- **0239 Venous Thromboembolism (VTE) Prophylaxis (AMA-PCPI)** – for surgical patients
- **0371 Venous Thromboembolism Prophylaxis (TJC)** – identical to 0434 but excludes stroke patients

Harmonization

In the prior evaluation the Committee expressed a desire for a single measure that could be used at the clinician and facility levels. The two developers agreed it was not feasible at that time to create a single measure. The Committee recommended continued and aggressive efforts for harmonization when possible, and requested an update on progress on harmonization at the time of annual review.

The developer reports that:

- Measures NQF# 0371 specifically excludes the stroke population. The measures are completely harmonized in terms of measure specifications and data element definitions.
- Measure 0239 is a physician performance measure with a targeted population of surgical patients identified through CPT codes and thus is a different level of measurement. This measure evaluates physician practice as opposed to hospital processes.

Questions for the Committee:

- *Are measures 0434 and 0240 optimally harmonized to reduce measurement burden for providers?*

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NQF #: 0434 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent venous thromboembolism (VTE) following ischemic or hemorrhagic stroke. VTE prophylaxis treatment >> VTE prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
The central topic for the measure is prevention of venous thromboembolic events by use of prophylaxis in hospitalized patients with ischemic or hemorrhagic stroke. Patients with restricted mobility, as is the case for the majority of hospitalized stroke patients, are particularly high-risk for developing VTE. This measure is consistent with the body of evidence that supports guideline recommendations from the American Heart Association/American Stroke Association for secondary stroke prevention, and the American College of Chest Physicians (ACCP)for antithrombotic therapy and prevention of thrombosis.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: There are literally hundreds of well designed, prospective, randomized clinical trials published over the past 35 years that have clearly demonstrated the efficacy of both pharmacologic and mechanical forms of VTE prophylaxis to prevent VTE events (including asymptomatic, symptomatic, and deaths from VTE). In 2008, the American College of Chest Physicians (ACCP) summarized more than 700 articles, most of which represented published clinical trials on prevention of VTE events. Similarly, there are dozens of observation studies that have evaluated use of VTE prophylaxis in hospitalized patients (usually through medical record audit) which show consistent underuse of prophylaxis.

Several systematic reviews of the evidence as it relates to the prevention of venous thromboembolism in stroke patients have been conducted. The Cochrane Stroke Group recently updated a review of low-molecular-weight heparins or heparinoids versus standard unfractionated heparin for acute ischemic stroke (2011), originally published in 1995 with a second update in 2005. The search strategy included the Cochrane Stroke Group's Trials Register (last searched June 2007); the Cochrane Central Register of Controlled Trials (CENTRAL)(The Cochrane Library 2007, Issue 2): MEDLINE (1966 to June 2007); and EMBASE (1980 to June 2007). For the previous version of this review, MedStrategy (1995) was also searched and pharmaceutical companies contacted. Selection criteria were specific for randomized trials comparing heparinoids or low-molecular-weight heparins with standard unfractionated heparin in persons with acute ischemic stroke.

This review identified nine trials involving 3137 ischemic stroke patients. Four trials compared a heparinoid (danaparoid) with standard unfractionated heparin. Another four trials compared enoxaparin or certoparin with unfractionated heparin, and one compared an unspecified low-molecular-weight heparin. Low-molecular-weight heparins or heparinoids were associated with a significant reduction in the odds of VTE compared with standard unfractionated heparin (odds ratio (OR) 0.55; 95% CI 0.44 to 0.70). Three new studies

(n=2397 participants) included in this review provided no information to change previous conclusions about the effectiveness of low-molecular-weight heparins for the prevention of VTE in the ischemic stroke population.

A second recent review from the Cochrane Stroke Group selected randomized control trials comparing mechanical forms of prophylaxis for the prevention of VTE post-stroke (2010). For this review, the Cochrane Stroke Group's Trials Register (last searched November 2009); the Cochrane Central Register of Controlled Trials (CENTRAL)(The Cochrane Library 2009, Issue 4): MEDLINE (1966 to November 2009); and EMBASE (1980 to November 2009), CINAHL (1980 to November 2009), and The British Nursing Index (1985 to November 2009) were searched, as well as, ongoing trials registers (November 2009). Additionally, identified experts in the field were contacted as needed. Two trial of graduated compression stockings (n=2615 participants) and two smaller studies involving intermittent compression devices (n=177 participants) were included in the review. Graduated compression stockings were not found to reduce VTE risk (OR 0.88; 95% CI 0.72 to 1.08) or death (OR 1.13; 95% CI 0.87 to 1.47) within the first seven days post-stroke; however, intermittent compression devices were associated with a non-significant trend toward decreased risk of VTE (OR 0.45; 95% CI 0.19 to 1.10) with no impact on deaths (OR 1.04; 95% CI 0.37 to 2.89).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting thromboprophylaxis to prevent VTE complications and reduce mortality after stroke is high. Data overwhelmingly support that thromboprophylaxis reduces VTE events in the stroke population, and that pharmacological prophylaxis is more beneficial than mechanical forms. Studies have also shown that fatal PE is prevented by thromboprophylaxis. With respect to complications of thromboprophylaxis, randomized clinical trials have demonstrated little or no increase in the rates of symptomatic intracranial and major extracranial hemorrhage (1-2%) with prophylactic doses of pharmacologic VTE prophylaxis. Risk of gastrointestinal hemorrhage or other major hemorrhage is the primary concern with ongoing therapy, although the studies have demonstrated that the risk is low and absolute benefits significantly outweigh the risks.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* Results of studies evaluating the efficacy of VTE prophylaxis following stroke provide consistent findings of reductions in event rates by more than 70% (Geerts, 2001). These findings are quite consistent across multiple clinical trials.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence on the immediate hazards and net benefits of prophylactic interventions for the prevention of venous (VTE) thromboembolism. Stroke patients have a high risk of deep vein thrombosis (DVT) in the paretic or paralyzed lower extremity with a pooled DVT incidence of 55%. Approximately 5-10% of early deaths following stroke are attributed to pulmonary embolism (PE). Among 421 patients admitted to a stroke rehabilitation unit, routine duplex ultrasonography detected proximal DVT in 14% at entry to the unit, and an additional 5% of patients without DVT prophylaxis were subsequently found to have proximal DVT during the rehabilitation stay (Desmukh M, 1991).

Routine use of thromboprophylaxis reduces adverse patient outcomes while at the same time decreasing overall costs. The PREVAIL (Prevention of VTE after acute ischemic stroke with LMWH and UFH) evaluated the economic impact of enoxaparin versus unfractionated heparin for venous thromboembolism prophylaxis in patients with acute ischemic stroke. Using a decision-analytic model to analyze hospital-based costs, Pineo and associates (2012) found that total hospital cost was lower with enoxaparin versus UFH ($782 versus $922, respectively; savings $140). The higher drug cost of enoxaparin was offset by the reduction in VTE events as compared to the use of UFH. Hospital cost-savings were greatest in patients with more severe strokes (i.e., National Institutes for Health Stroke Scale (NIHSS) scores > 14).

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American College of Chest Physicians. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: GRADE

1c.12 If other, identify and describe the grading scale with definitions:

1c.13 Grade Assigned to the Body of Evidence: Grade 2B

1c.14 Summary of Controversy/Contradictory Evidence: There is no dispute that graduated compression stockings are not sufficient thromboprophylaxis for acutely ill stroke patients. Abundant data support the use of pharmacological thromboprophylaxis for acute ischemic stroke over intermittent compression devices, unless contraindicated. Data also suggest that low-molecular-weight heparin enoxaparin has a superior clinical profile in comparison with unfractionated heparin. Yet, the relative advantages and disadvantages of various prophylactic drugs remains questionable.

1c.16 Quote verbatim, <u>the specific guideline recommendation</u> *(Including guideline # and/or page #)*:
2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke, page 1689.

Class I, Level of Evidence A
Subcutaneous administration of anticoagulants is recommended for treatment of immobilized patients to prevent deep vein thrombosis. The ideal timing for starting these medications is not known.

Class IIa, Level of Evidence B
The use of intermittent external compression devices is recommended for treatment of patients who cannot receive anticoagulants.

Antithrombotic Therapy and Prevention of Thrombosis, 9th Ed: American College of Chest Physicians Evidence-Based Clinical Practice Guidelines, page 33S-34S.

Grade 2B
In patients with acute ischemic stroke and restricted mobility, we suggest prophylactic dose SC UFH or LMWH or intermittent pneumatic compression devices over no prophylaxis.

In patients with acute stroke and restricted mobility, we suggest against elastic compression stockings.

In patients with acute primary intracerebral hemorrhage and restricted mobility we suggest prophylactic-dose LMWH over prophylactic dose UFH.

In patients with primary intracerebral hemorrhage and restricted mobility, we suggest against elastic compression stockings.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on January 6, 2007. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: AHA: Class I, Level of Evidence A; ACCP: GRADE 2B

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

The American College of Chest Physicians Guidelines are comprehensive in scope and also include recommendations for VTE prevention in patients with ischemic and hemorrhagic stroke. Guideline recommendations for pharmacological and mechanical thromboprophylaxis are combined.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0434_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Prevention of venous thromboembolism (VTE) through the use of prophylactic treatment for high-risk stroke patients is recommended by both the American Heart Association/American Stroke Association (AHA/ASA) and the American College of Chest Physicians (ACCP). Data suggest that VTE prophylaxis should be administered to stroke patients with restricted mobility soon after hospitalization. Results of studies evaluating the efficacy of VTE prophylaxis provide consistent findings of reductions in event rates by 50%-75% in most studies. These findings are quite consistent across hundreds of clinical trials and for many patient populations; placebo control groups are no longer considered ethical (Leizorovicz A, 2004).

Healthcare organizations that track VTE prophylaxis for internal quality improvement purposes have seen significant improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measurement requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-1 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 2668 denominator cases; 2220 numerator cases; 49 hospitals; 0.83208 national aggregate rate; 0.76618 mean of hospital rates; 0.22024 standard deviation; 0.96296 90th percentile rate; 0.92453 75th percentile rate/upper quartile; 0.82813 50th percentile rate/median rate; 0.69565 25th percentile rate/lower quartile; and, 0.43032 10th percentile rate .

CY 2010: 25031 denominator cases; 22083numerator cases; 138 hospitals; 0.88223 national aggregate rate; 0.83435 mean of hospital rates; 0.16701 standard deviation; 0.9837 90th percentile rate; 0.95775 75th percentile rate/upper quartile; 0.87923 50th percentile rate/median rate; 0.78261 25th percentile rate/lower quartile; and, 0.5959610th percentile rate.

CY 2011: 29680 denominator cases; 27393 numerator cases; 157 hospitals; 0.92294 national aggregate rate; 0.88278 mean of hospital rates; 0.14973 standard deviation; 0.99563 90th percentile rate; 0.97521 75th percentile rate/upper quartile; 0.94152 50th percentile rate/median rate; 0.85714 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2012: 29538 denominator cases; 27859 numerator cases; 158 hospitals; 0.94316 national aggregate rate; .092953 mean of hospital rates; 0.09568 standard deviation; 1.0 90th percentile rate; 0.98851 75th percentile rate/upper quartile; 0.95652 50th percentile rate/median rate; 0.90909 25th percentile rate/lower quartile; and, 0.81619 10th percentile rate.

CY 2013: 44644 denominator cases; 42851 numerator cases; 264 hospitals; 0.95984 national aggregate rate; 0.94689 mean of hospital rates; 0.10083 standard deviation; 1.0 90th percentile rate; 0.99442 75th percentile rate/upper quartile; 0.9754 50th percentile rate/median rate; 0.94306 25th percentile rate/lower quartile; and, 0.8764 10th percentile rate.

CY 2014: 213000 denominator cases; 207132 numerator cases; 1299 hospitals; 0.97254 national aggregate rate; 0.96243 mean of

hospital rates; 0.07648 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98618 50th percentile rate/median rate; 0.95853 25th percentile rate/lower quartile; and, 0.90909 10th percentile rate.

1b.3. **If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.**
Not applicable.

1b.4. **Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability.** *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable. According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistical figures reveal that although women have a higher "life-time risk of stroke" than men, they have a lower "age-adjusted risk of stroke" and, women ages 45-85 have a lower overall rate of stroke. Stroke risk significantly increases for women > 85 years old; however, women live longer than men which may account in part for the difference (Roger VL, et al., 2012).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years if age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

There are few data published on racial differences in the use of VTE prophylaxis. A single study from a university hospital in Hawaii showed that Japanese patients were less likely to receive VTE prophylaxis than other racial groups. However this is not likely representative of practice in most US hospitals and may be appropriate based on Japanese patients´ lower risk for VTE events. There are robust data on racial differences in rates of VTE based on race/ethnicity. In most studies African American men have higher rates of VTE than white patients. The lowest rates of VTE are seen in patients of Asian/Pacific Islander decent.

As previously mentioned, ethnic minorities suffer higher mortality and higher rates of more severe hemorrhagic strokes. Increased stroke severity and immobilization increase the risk of developing VTE. Although no data were found noting disparities in VTE prophylaxis administration for stroke patients, there are some data that inpatient evaluation differed between African Americans and whites.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.

According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to 75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

Ischemic strokes in black patients occur earlier in life, and age-standardized mortality due to ischemic stroke are higher in blacks when compared to the general population (Schwamm, L., et al., 2010). Blacks have less access to quality care, a higher prevalence of risk factors, and more severe deficit when the stroke occurs (Qian, F., et al., 2013).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. Hispanics are at a greater risk for stroke as compared with non-Hispanic whites, even living in the same community (Schwamm, L., et al., 2010). A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Qian, F., et al., (2013) found that non-Hispanic Blacks, Hispanic, and non-Hispanic Asian Americans patients were less likely to die than non-Hispanic whites, within 30 days of admission. Then again they were less likely to die within one year of admission and within one year of discharge. In comparison with non-Hispanic white patients, the measured race/ethnicity groups had a lower 30 day mortality rate of hospital admission. Survival after one year post discharge was strongest in the non-Hispanic Asian Americans. When the authors compared non-Hispanic white groups with non-Hispanic black and Hispanic groups, the non-Hispanic black and Hispanic groups had a higher one year all cause and stroke associated re hospitalization. Non-Hispanic Asian Americans had a lower one year all cause re hospitalization rate.

There are few data published on racial differences in the use of VTE prophylaxis. A single study from a university hospital in Hawaii showed that Japanese patients were less likely to receive VTE prophylaxis than other racial groups. However this is not likely representative of practice in most US hospitals and may be appropriate based on Japanese patients´ lower risk for VTE events. There are robust data on racial differences in rates of VTE based on race/ethnicity. In most studies African American men have higher rates of VTE than white patients. The lowest rates of VTE are seen in patients of Asian/Pacific Islander decent.

In a study done by Schwamm, L., et al (2010), examiners found that there were modest differences in DVT Prophylaxis in black patients. Although small, it is thought they are large enough to result in the overall in hospital mortality due to pulmonary emboli. They continued to assess the evidence regarding the ability to ambulate at discharge, and found black and Hispanic patients were able to ambulate greater than the white population. This may be due to age or other unmeasured factors, and not related to quality of care.

As previously mentioned, ethnic minorities suffer higher mortality and higher rates of more severe hemorrhagic strokes. Increased stroke severity and immobilization increase the risk of developing VTE. Although no data were found noting disparities in VTE prophylaxis administration for stroke patients, there are some data that inpatient evaluation differed between African Americans and whites.

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$).168 (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

The 2015 report by The Agency for Healthcare Research and Quality (AHRQ) indicates that
"Pharmacologic methods to prevent venous thromboembolism are safe, effective, cost-effective, and advocated by authoritative guidelines, yet large prospective studies continue to demonstrate that these preventive methods are significantly underused." Increased stroke severity and immobilization increase the risk of developing VTE. Pulmonary embolism accounts for approximately 10% of deaths after stroke, and the complication may be detected in approximately 1% of patients who have had a stroke, underscoring the importance of prevention as the most critical action step for reducing death from PE (Wijdicks and Scott, 1997). Besides being associated with life-threatening PE, symptomatic DVT also slows recovery and rehabilitation after stroke (Jauch, E.C., et al, 2013).

1c.5. If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful. *(Describe how and from whom their input was obtained.)*
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA), Prevention

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Venous Thromboembolism

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
http://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Since the last endorsement date, the data element Reason for Oral Factor Xa was added to the measure logic and the algorithm revised based on Nov. 4, 2011 FDA approval of rivaroxaban for stroke prevention in patients with atrial fibrillation. Direct oral anticoagulant agents have been added to Appendix H, Table 2.1 VTE Prophylaxis Inclusion Table as they have been approved for the U.S. Food and Drug Administration (FDA).

All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must all transition to a new set of codes for electronic health care transactions on October 1, 2015.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic or hemorrhagic stroke patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given on the day of or the day after hospital admission.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care.

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*

IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.

Four data elements are used to calculate the numerator:

• Reason for No VTE Prophylaxis – Hospital Admission - Documentation of a reason why no mechanical or pharmacological prophylaxis was administered at hospital admission.
Allowable values: Yes or No/UTD.

• Reason for Oral Factor Xa Inhibitor – Documentation of a reason why Oral Factor Xa Inhibitor was administered for VTE prophylaxis.
Allowable values: Yes or No/UTD.

• VTE Prophylaxis – The type of venous thromboembolism prophylaxis documented in the medical record.
Allowable values: 1 Low dose unfractionated heparin (LDUH); 2 Low molecular weight heparin (LMWH); 3 Intermittent pneumatic compression devices (IPC); 4 Graduated compression stockings (GCS); 5 Factor Xa Inhibitor; 6 Warfarin; 7 Venous foot pumps (VFP); 8 Oral Factor Xa Inhibitor; 9 Aspirin; A None of the above or not documented or unable to determine from medical record documentation.

• VTE Prophylaxis Date – The month, day, and year that the initial VTE prophylaxis (mechanical and/or pharmacological) was administered after hospital admission.

Patients are eligible for the numerator population when VTE Prophylaxis equals 1,2,3,5,6,7, or allowable value equals "yes" for Reason for No VTE Prophylaxis-Hospital Admission or "yes" for Reason for Oral Factor Xa Inhibitor and VTE Prophylaxis Date = 0 or 1.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Ischemic or hemorrhagic stroke patients

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Seven data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Birthdate - The month, day and year the patient was born.
3. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
4. Comfort Measures Only – The earliest day the physician/APN/PA documented comfort measures only after hospital arrival.
Allowable values: 1 (Day 0 or 1); 2 (Day 2 or after); 3 (Timing Unclear); 4 (Not Documented/UTD).
5. Discharge Date – The month day and year the patient was discharged from acute care, left against medical advice or expired during the stay.
6. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
7. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic or hemorrhagic stroke as defined in Appendix A, Table 8.1 or Table 8.2.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*

- Less than 18 years of age
- Length of Stay < 2 days
- Length of Stay > 120 days
- Comfort measures only documented on day of or day after hospital arrival
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*

- The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.
- The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is less than 2 days or greater than 120 days, the patient is excluded.
- Patients with Comfort Measures Only allowable value of 1 (Day 0 or 1) are excluded.
- Patients are excluded if "Yes" is selected for Clinical Trial.
- Patients with ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3, if medical record documentation states that the patient was admitted for the elective performance of this procedure are excluded.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*

Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)

No risk adjustment or risk stratification

If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*

Not applicable

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*

Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)

S.16. **Type of score:**

Rate/proportion

If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*

Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*

1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check Comfort Measures Only

a. If Comfort Measures Only is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.

b. If Comfort Measures Only equals 1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.

c. If Comfort Measures Only equals 2, 3, or 4, continue processing and proceed to Clinical Trial.

3. Check Clinical Trial

a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.

b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

4. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Length of Stay calculation.

5. Calculate the Length of Stay (LOS). Length of Stay, in days, is equal to the Discharge Date minus the Admission Date.

6. Check Length of Stay (LOS)
a. If the Length of Stay is greater than or equal to zero and less than 2, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the Length of Stay is greater than or equal to 2, continue processing and proceed to VTE Prophylaxis.

7. Check VTE Prophylaxis
a. If VTE Prophylaxis is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If VTE Prophylaxis equals A only, continue processing and proceed to Reason for No VTE Prophylaxis-Hospital Admission.
c. If VTE Prophylaxis equals 1, 2, 3, 4, 5, 6, 7, 8 or 9, continue processing and proceed to step 9 and recheck VTE Prophylaxis.

8. Check Reason for No VTE Prophylaxis-Hospital Admission
a. If Reason for No VTE Prophylaxis-Hospital Admission is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for No VTE Prophylaxis-Hospital Admission equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Reason for No VTE Prophylaxis-Hospital Admission equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

9. Recheck VTE Prophylaxis
a. If none of the VTE Prophylaxis equals 1, 2, 3, 5, 6 or 7, continue processing and recheck VTE Prophylaxis.
b. If any VTE Prophylaxis equals 1, 2, 3, 5, 6 or 7, continue processing and proceed to step 13 and check VTE Prophylaxis Date.

10. Recheck VTE Prophylaxis
a. If VTE Prophylaxis is not equal to 8, continue processing and proceed to Reasons for No VTE Prophylaxis-Hospital Admission.
b. If any of VTE Prophylaxis equals 8, continue processing and proceed to step 12 and check Reason for Oral Factor Xa Inhibitor.

11. Check Reason for No VTE Prophylaxis-Hospital Admission
a. If Reason for No VTE Prophylaxis-Hospital Admission is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for No VTE Prophylaxis-Hospital Admission equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Reason for No VTE Prophylaxis-Hospital Admission equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

12. Check Reason for Oral Factor Xa Inhibitor
a. If Reason for Oral Factor Xa Inhibitor is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Oral Factor Xa Inhibitor equals Yes, continue processing and proceed to VTE Prophylaxis Date.
c. If Reason for Oral Factor Xa Inhibitor equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

13. Check VTE Prophylaxis Date
a. If VTE Prophylaxis Date is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.

b. If VTE Prophylaxis Date equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the VTE Prophylaxis Date equals a Non-Unable To Determine (non-UTD) Value, continue processing and proceed to VTE Prophylaxis Day calculation.

14. Calculate VTE Prophylaxis Day. The VTE Prophylaxis Day, in days, is equal to the VTE Prophylaxis Date minus the Admission Date.

15. Check VTE Prophylaxis Day
a. If the VTE Prophylaxis Day is equal to zero or 1, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
b. If the VTE Prophylaxis Day is greater than or equal to 2, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the VTE Prophylaxis Day is less than 0, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
The Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45
If "N" 6-44, No sampling; 100% Initial Patient Population required
If "N" 0-5, Submission of patient level data is not required; if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Monthly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N >/= 300, then "n" 60
If "N 76-299, then "n" 20% of Initial Patient Population size
If "N 15-75, then "n" 15
If "N < 15, No sampling; 100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the

data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
0434_MeasureTesting_MSF5.0_Data-635905390698284756.doc

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0434 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.*)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on this measure is as follows:
170 health care organizations representing various hospital demographics:
17 For Profit; 144 Not for Profit; 9 Government
62 >=300 beds; 71 100-299 beds; 37 <100 beds
142 Urban; 28 Rural
22 Teaching; 148 Non-teaching

States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI

15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:
At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements

- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:
- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:
Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010-3Q2011) have shown an overall agreement rate of 97.84%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-1.

Data Elements	Total'n'numerator	Total'n'denominator	Rate
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
Reason for No VTE Prophylaxis-Hospital Admission	37	45	82.2%
VTE Prophylaxis	293	326	89.9%
VTE Prophylaxis Date	263	281	94.0%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:
This measure focuses on ischemic or hemorrhagic stroke patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given the day of or day after hospital admission. The literature supporting this measure indicates that VTE prophylaxis is appropriate for hospitalized stroke patients because they are at increased risk of developing VTE when compared to other hospitalized medical and surgical patients. This measure excludes patients less than 18 years of age. Also excluded from the measure are patients who have a length of stay (LOS) of less than two days or more than 120 days, those who are enrolled in a clinical trial for stroke or for whom comfort measures only have been ordered on the day of or the day after arrival. These exclusions are not addressed in the literature, but are included for this measure in order to harmonize with other CMS/Joint Commission aligned measures.

The measure specifications differ from guideline recommendations by excluding patients admitted for Elective Carotid Intervention. Operationally, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:
At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from

measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of this measure. And finally, conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:
Analysis of feedback obtained via our automated feedback system reveals 193 submissions regarding specifications for this measure over the past year. STK-1 receives more questions than other measures in the stroke set, resulting from modification to the measure following CMS alignment with similar Surgical Care Improvement Project (SCIP) VTE and VTE core measures. Questions involve all three numerator data elements VTE Prophylaxis, VTE Prophylaxis Date, and Reason for No VTE Prophylaxis Hospital Admission. Questions about the acceptability of sequential compression devices (SCDs) alone when administered without documentation of a contraindication to pharmacological prophylaxis, as well as the need for VTE prophylaxis for ambulatory patients, are frequently received. The requirement for documentation of both pharmacological and mechanical reasons when neither form of prophylaxis is administered is another common theme. Clarifying notes for abstraction have been added to the data element definition for Reason for No VTE Prophylaxis-Hospital Admission to ease abstraction, as well as, feedback provided to individual users.

Many questions have been received regarding the acceptability of new anticoagulant agents, (i.e., dabigatran, rivaroxaban) for inclusion in the numerator population when these agents are administered the day of or day after hospital admission. Since the dabigatran indication approved by the U.S. Food and Drug (FDA) administration is for prevention of stroke in patients with a diagnosis of atrial fibrillation, but does not include a specific indication for VTE prophylaxis, an abstraction guideline has been added to the data element Reason for No VTE Prophylaxis-Hospital Admission. This abstraction guideline allows patients who receive anticoagulant therapy other than warfarin (e.g., dabigatran) for atrial fibrillation or other conditions the day of or day after hospital admission to be included in the numerator for this measure. The next version of the specifications manual details algorithm revisions to address the appropriate use of rivaroxaban for stroke patients with atrial fibrillation/flutter. In the interim, hospitals have been instructed to apply the same guideline used for dabigatran to include rivaroxaban cases in the numerator.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:
Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.
These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a Length of Stay (LOS) less than 2 days
3. Patients who have a length of stay (LOS) greater than 120 days
4. Patients with Comfort Measures Only documented on the day of or day after hospital arrival
5. Patients enrolled in clinical trials
6. Patients admitted for Elective Carotid Intervention

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*
N=39,812

1. Patients < 18 years old = 0%
2. Patients who have a Length of Stay (LOS) less than 2 days = 1.93%
3. Patients who have a length of stay (LOS) greater than 120 days = 0%
4. Patients with Comfort Measures Only documented on the day of or day after hospital arrival = 0.62%
5. Patients enrolled in clinical trials =0.39%
6. Patients admitted for Elective Carotid Intervention = 9.96%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:
Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:
Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:
Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:
The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:
STK-1 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10thPercentile
3Q2011	154	0.88228	0.17825	1	1	0.94666	0.85	0.69231

2Q2011	155	0.88398	0.17796	1	1	0.94595	0.86441	0.67742
1Q2011	160	0.86562	0.17885	1	0.98571	0.92857	0.83485	0.62179
4Q2010	136	0.85448	0.2120	1	0.99738	0.92582	0.83333	0.55319
3Q2010	131	0.82709	0.2078	1	0.97222	0.89744	0.77778	0.57143
2Q2010	122	0.83441	0.1884	1	0.96429	0.89609	0.76471	0.58621
1Q2010	100	0.81077	0.2045	1	0.95676	0.86667	0.75379	0.52273
4Q2009	49	0.76618	0.22024	0.96296	0.92453	0.82813	0.69565	0.46032

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Multiple data sources are not used for this measure.

2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*:
Not applicable

2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*:
Not applicable

2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:
This measure was originally specified to capture overall rates of VTE prophylaxis for ischemic or hemorrhagic stroke patients with no focus on disparities. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data, might be collected reliably.

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met?
(*Reliability and Validity must be rated moderate or high*) Yes☐ No☐
Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b6)

2b2. VALIDITY TESTING
2b2.1. What level of validity testing was conducted? (*may be one or both levels*)
☐ **Critical data elements** (*data element validity must address ALL critical data elements*)
☐ **Performance measure score**

☐ **Empirical validity testing**

☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year of data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospital selection was based on those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospitals patient level data from The Joint Commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for stroke as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke (STK) process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:
N=1,318 hospitals
n= 2, 206,379 patients records

STK-1
Median: 98%
Percentile 10%: 93%
Percentile 25%: 97%
Percentile 75%: 100%
Percentile 90%: 100%

Pearson Correlation Coefficients Prob > |r| under H0: Rho=0 Number of Observations							
	STK_1	STK_2	STK_3	STK_4	STK_5	STK_6	STK_10

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicate convergent validity of the measures.
STK-01 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patients who have a Length of Stay less than 2 days
- Patient who have a Length of Stay greater than 120 days

- Patients with *Comfort Measures* documented on day of or day after arrival
- Patient enrolled in a Clinical Trial
- Patients admitted for *Elective Carotid Intervention*

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are detailed below:

Exclusion: *Comfort Measures Only* documented on day of or day after arrival
Overall Occurrence n = 28,126
Overall Occurrence Percentage: 4.46%
Minimum: 0.31%
10th Percentile: 1.67%
Median: 4.40%
90th Percentile: 9.09%
Maximum: 30.8%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.6%
90th Percentile: 25.31%
Maximum: 95.3%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age
Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days

Rationale: Included to harmonize with other CMS/Joint Commission aligned measures.

Patients who have a Length of Stay less than 2
Rationale: Inclusion of patients with a Length of Stay shorter than 2 days may falsely increase the denominator population.

Patients with *Comfort Measures Only* documented on day of or day after arrival
Rationale: It is inappropriate to treat such patients beyond those measures necessary for comfort.

Patients enrolled in a Clinical Trial
Rationale: *VTE Prophylaxis* as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require VTE prophylaxis.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting Quality Check® http://www.qualitycheck.org/consumer/searchQCR.aspx Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program XX Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx Disease-Specific Care Certification for Primary Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

• Name of program and sponsor: Quality Check®; The Joint Commission

• Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.

• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
• Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ Medicare-certified hospitals (2015)

• Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
• Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
• Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

• Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
• Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

• Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
• Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

• Name of program and sponsor Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

• Name of program and sponsor Hospital Accreditation Program; The Joint Commission
• Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. **If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons?** (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. **If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement.** (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in

use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

Progress (trends in performance results, number and percentage of people receiving high-quality healthcare:
The rate of VTE prophylaxis has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 97.3%. A gap of 9-10% still exists for the 10th percentile of hospitals. Modest differences in VTE prophylaxis in black patients have been reported by GWTG (Schwamm, 2010).

Geographic area and number and percentage of accountable entities and patients included:
Nationwide; 1299 hospitals; 213,000 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
As a requirement for inclusion of the stroke measures as a core measure set in the Specifications Manual for National Hospital Inpatient Quality Measures (October 2009), the STK-1 algorithm was revised to align with specifications for similar core measure sets. Subsequently, allowable value (9) aspirin was added to the data element VTE Prophylaxis for the Surgical Care Improvement Project (SCIP) VTE measures. The addition of aspirin in the data element caused a need to educate stroke abstractors that aspirin alone without another form of VTE Prophylaxis or a documented reason why only aspirin was administered for prophylaxis is needed, as aspirin is not approved by the U.S. Food and Drug Administration (FDA) for VTE prophylaxis in the stroke population.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0218 : Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery
0239 : Perioperative Care: Venous Thromboembolism (VTE) Prophylaxis
0371 : Venous Thromboembolism Prophylaxis
0372 : Intensive Care Unit Venous Thromboembolism Prophylaxis

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0217 : Surgery Patients with Recommended Venous Thromboembolism (VTE) Prophylaxis Ordered; Centers for Medicare and Medicaid Services

0240: Stroke and Stroke Rehabilitation: Venous Thromboembolism (VTE) Prophylaxis for Ischemic Stroke or Intracranial Hemorrhage; American Academy of Neurology

5a. Harmonization

The measure specifications are harmonized with related measures;

OR

The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures NQF# 0371 and NQF# 0372 are Venous Thromboembolism (VTE) measures which specifically exclude the stroke population. The measures are completely harmonized in terms of measure specifications and data element definitions; NQF# 0218 addresses the surgical population only, and therefore do not apply to stroke patients. Common data elements with this measure have been completely harmonized. Measure 0239 is a physician performance measure with a targeted population of surgical patients identified through CPT codes and thus is a different level of measurement. This measure evaluates physician practice as opposed to hospital processes.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);

OR

Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 0435
Measure Title: STK 02: Discharged on Antithrombotic Therapy
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients prescribed antithrombotic therapy at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy,STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. Studies have shown that antithrombotic therapy prescribed at discharge following acute ischemic stroke reduces stroke mortality and morbidity.

Healthcare organizations that track antithrombotic therapy prescribed at discharge for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic stroke patients prescribed antithrombotic therapy at hospital discharge
Denominator Statement: Ischemic stroke patients
Denominator Exclusions:
- Less than 18 years of age
- Length of Stay > 120 days
- Comfort measures only documented
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Discharged to another hospital
- Left against medical advice
- Expired
- Discharged to home for hospice care
- Discharged to a health care facility for hospice care
- Documented reason for not prescribing antithrombotic therapy at discharge

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records

Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence

Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012:

- The body of evidence consistently supports that prolonged antithrombotic therapy reduces the risk of death in patients with a prior history of ischemic stroke. Based on these findings, antithrombotic therapy should be prescribed at discharge following acute ischemic stroke, unless there are contraindications to therapy.
- 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 249.
    - Class I, Level of Evidence A - For patients with noncardioembolic ischemic stroke or TIA, the use of antiplatelet agents rather than oral anticoagulation is recommended to reduce the risk of recurrent stroke or another cardiovascular event.
    - Aspirin (50 mg/d to 325 mg/d) monotherapy (Class I, Level of Evidence A), the combination of aspirin 25 mg and extended-release dipyridamole 200 mg twice daily (Class I, Level of Evidence B), and clopidogrel 75 mg monotherapy daily (Class IIa, Level of Evidence B), are all acceptable options for initial therapy. The selection of an antiplatelet agent should be individualized on the basis of patient risk factor profiles, cost, tolerance, and other clinical characteristics.
- The 2012 Committee expressed no concerns regarding the evidence underlying this measure.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**

☐ **The developer provided updated evidence for this measure:**

Guidance from the Evidence Algorithm:

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	137	157	158	262	1299
# cases (den)	19,889	24,053	24,420	37,661	180,048
National aggregate rate	0.99	0.99	0.99	0.99	0.99
Mean hospital rate	0.98	0.97	0.99	0.99	0.99
50th percentile	1.00	1.00	1.00	1.00	1.00
10th and 90th percentiles	0.94 (10th) 1.00 (90th)	0.95 (10th) 1.00 (90th)	0.97 (10th) 1.00 (90th)	0.98 (10th) 1.00 (90th)	0.98 (10th) 1.00 (90th)

- Participation in this measure has grown significantly in the past five years. National hospital performance seems to be very high with little to no room for improvement.
- In 2012, the Committee noted the overall high rate of performance for this measure (approximately 98% among reporting hospitals).

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Data for 2014 includes 1,299 hospitals. What proportion of hospitals caring for stroke patients is captured in this data?*
- *Performance over five years has been consistently high. How much further improvement in performance is likely using this measure?*
- *Does a gap in care still exist that warrants this national performance measure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **Not aware of any new studies/information

**The measure documents the proportion of patients with ischemic stroke prescribed antithrombotic therapy at hospital discharge. There is ample empirical evidence supporting the benefits antithrombotic therapy at discharge for secondary prevention of subsequent stroke or other cardiovascular events as well as slight but significant decrease in mortality.

**I am not aware of any new information that changes the evidence for this measure.

1b. Performance Gap

Comments: **No disparities data provided

**Participation in this measure has increased over time Evidence supports an increase in national hospital performance -with an approximate rate of 98% for all reporting hospitals in 2014-data also suggest little to no improvement . However, substantial racial/ethnic disparities in stroke mortality and morbidity are well documented. Despite evidence of overall increased use of antithrobotics at discharge -a 2013 study(Quian et al) as well as CDC 2014 reports indicate that disparities still exist.

**There was performance gap data. However, it showed that the gap has narrowed substantially since the initiation of this measure. Compliance with the standard is now so high that those cases in which included patients were not discharged on antithrombotic therapy may well have been failure to recognize an indication in the chart as to the reason, or valid reasons not included in the specification. There is little performance gap remaining to close.

1c. High Priority (previously referred to as High Impact)

Comments: **NA

**Yes

**Yes. stated and logical

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- One data element defines the numerator and nine data elements define the denominator.
- Developer reports that "Since the last endorsement date, the measure rationale for STK-02: Discharged on Antithrombotic Therapy was updated to address the use of novel oral anticoagulant drugs in stroke patients requiring antithrombotic therapy. In recent years, direct oral anticoagulant agents (DOACs) [A.K.A. novel oral anticoagulant agents (NOACs)] have been developed and approved by the U.S. Food and Drug Administration (FDA) for stroke prevention, and may be considered as an alternative to warfarin for select patients. Following FDA new drug approval of these agents, several DOACs were added to the medication table for antithrombotic medications (Appendix C, Table 8.2) used for abstraction of the measure."
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke).
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.

- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.
- The measures is specified at the hospital level of analysis.

Questions for the Committee :

- *Are changes to the measure specifications appropriate?*
- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

For maintenance measures, summarize the reliability testing from the prior review:

- Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 97.61%.
  - One data element found less than 95% agreement: Reason for Not Prescribing Antithrombotic Therapy at Discharge (91%). No Kappa scores were presented.

Describe any updates to testing: No new information provided

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing: see above

Results of reliability testing: see above

Guidance from the Reliability Algorithm:

Precise specifications (Box 1) → empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9) → high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

For maintenance measures, summarize the validity testing from the prior review:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users that is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions involve the data elements Reason for Not Prescribing Antithrombotic Therapy at Discharge. In addition, developers received questions regarding acceptability of new anticoagulant agents.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

- ☐ **Face validity only**
- ☒ **Empirical validity testing of the measure score**

Validity testing method:

- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:
  - Patients less than 18 years of age
  - Patient who have a Length of Stay greater than 120 days
  - Patients with Comfort Measures

- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Comfort Measures Only: 10.4% (range 0.30-35.7%)
  - Clinical Trial: 0.25% (range 0.08-35.5%)
  - Patients admitted for Elective Carotid Intervention: 11.8% (range 0.16-95.2%)
  - Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge: 6.27% (range 0.27%-60.6%)
  - Patients discharged to another hospital: 35.7% (range 0.79-76.2%)
  - Patients who left against medical advice: 0.67% (range 0.06-9.67%)
  - Patients who expired: 6.04% (range 0.39-20.1%)
  - Patients discharged to home for hospice care: 52.2% (range 6.25-94.3%)
  - Patients discharged to a health care facility for hospice care: 3% (range 0.16-23%)

Questions for the Committee:

- *In this sample approximately half of the patients are excluded. Does the large number of exclusions for Patients discharged to home for hospice care pose a threat to validity of the measure?*
- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →moderate confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **Specifications consistent with evidence

**none

**Specifications are consistent with the evidence

2a2. Reliability Testing

Comments: **New validity testing had adequate scope and method

**yes

**Validity was tested with focus groups. Demonstrated that performance on this measure was highly correlated with those of 7 stroke measures.

2b2. Validity Testing

Comments: **No

**Possibly-data are based on chart extraction for some hospitals -not all extract data from EHR. Given the large volume of stroke patients some error in data collection expected. Closer examination of patients excluded is warrented- particular attention to racial/ethnic characteristics of excluded patients would be useful.

**Exclusions are consistent with the evidence. The large number of exclusions is important given the demographics of the stroke population- many patients are discharged to hospice care.

Risk adjustment not used

Meaningful differences. The measure performance is meaningful. However, compliance for included patients is so high that there are few differences to detect.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **No new reliability data provided

**yes

**Reliability testing was adequate

Criterion 3. Feasibility

Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement. [feasibility]

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available
- Some data elements are in electronic form
- Data collection burden is significant.

Questions for the Committee:

- o *Are the required data elements routinely generated and used during care delivery?*
- o *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- o *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments
Criteria 3: Feasibility

3a. Byproduct of Care Processes
3b. Electronic Sources
3c. Data Collection Strategy
Comments: **No concerns
**Medical record abstraction in the absence of EHR data is burdensome.
**All data elements are routinely generated and readily available in electronic form. Data collection may be tedious in the absence of an electronic health record.

Criterion 4: Usability and Use
Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure
Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CMS Hospital Compare: Public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer provided the following progress information on 1,256 hospitals nationwide and 180,048 patients:
    - The rate of antithrombotic therapy prescribed at discharge has steadily increased over the past five

years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 99.4%. A modest gap of approximately 3% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate of antithrombotic therapy at discharge published by GWTG-Stroke and PCNASR.
    - Compared to antithrombotic at discharge rates of approximately 75% at the turn of the millennium (Lichtman JH, 2011), the performance gap has significantly narrowed.
    - Significant and important differences between races in rates of antithrombotic therapy prescribed at discharge persist (Schwamm, 2010, Qian, 3013; CDC 2014).

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- Developer did not identify any unintended consequences related to this measure.

Feedback :

- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency
4b. Improvement
4c. Unintended Consequences
Comments: **Agree high usability
**The reporting is very straightforward and easy to interpret. Given the well established utility of antithrobotic therapy and the low cost of aspirin -the benefits of this measure outweigh the burden of data collection.
**The measure is reported by the Joint Commission, CDC and CMS

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
- 0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology – not NQF endorsed

Harmonization :

- In the prior evaluation of #0325 and #0435, the Committee expressed a desire for a single measure that could be used at the clinician and facility levels. The two developers agreed it was not feasible at that time to create a single measure. The Committee recommended continued and aggressive efforts for harmonization when possible, and requested an update on progress on harmonization at the time of annual review.
- In 2012 the Committee suggested that the developer consider developing a composite measure that included

#0435 and #0438; they noted that such a composite measure would indicate the percentage of patients who receive appropriate care at both time points and that such a measure would likely provide more opportunity for improvement. The Committee asked the developer if they could provide data on the percentage of patients who get antithrombotic therapy at discharge but not on day two and vice-versa.

- The Joint Commission conducted further data analysis of these measures. Data were collected for the period 4Q2010 to 3Q2011. During this one-year period, data from 39,812 patient records were collected for all stroke (STK) measures. Altogether there were 15,789 patients that received antithrombotic therapy at discharge or by the end of hospital day 2 and were included in the measure population of both measures. Of these, 97 (0.6%) did not have therapy prescribed at discharge and 267 (1.7%) did not have therapy on day two.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0435 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent a secondary stroke following a new ischemic stroke. Antithrombotic prescribed at discharge >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the prevention of stroke in patients with stroke or transient ischemic attack. The Antiplatelet Trialists' Collaboration (1994) and later Antithrombotic Trialists' Collaboration (2002) have confirmed that the benefit of long-term antithrombotic therapy to patients with ischemic stroke is well established.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: In 2002, the Antithrombotic Trialists' Collaboration published a systematic overview of the relevant literature supporting antiplatelet therapy for prevention of death, myocardial infarction, and stroke in high risk patients. The collaboration reviewed 287 studies involving 135,000 patients in comparisons of antiplatelet therapy versus control and 77,000 patients in comparisons of different antiplatelet regimens. Twenty-one of the 287 trials were randomized control trials (n=18,270) involving patients with a history of stroke or transient ischemic attack allocated to a mean duration of 29 months of antiplatelet therapy. Since the previous meta-analysis (1994; 10,255 patients in 18 trials), the amount of information available on the effects of long-term antithrombotic therapy among patients with a history of stroke or transient ischemic attack has substantially increased, primarily due to the results of the second European Stroke Prevention Study (n-6602).

Relevant trials were identified through electronic database searches (MEDLINE, Embase, Derwent, Scisearch, and Biosis), searching the trials registers of the Cochrane Stroke and Peripheral Vascular Disease Groups; manual searching of journals, abstracts, and proceedings of meetings; scrutinizing the reference lists of trials and review articles; and professional inquiry, including colleagues and representatives of pharmaceutical companies.

Trials available by September 1997 that compared an antiplatelet regimen with a control or one antiplatelet regimen with another among patients considered to be high annual risk (> 3%/year) of vascular events because of evidence of pre-existing disease were included in the meta-analysis. Only those trials believed to have used a randomization method that precluded prior knowledge of the next treatment allocated and contained two randomized groups that differed only with respect to the antiplatet comparison of interest were selected. Furthermore, trials of oral antiplatet regimens were eligible only if they had assessed more than one day of treatment. An antiplatelet drug was defined as one whose primary effect on the vascular system inhibits platelet adhesion, platelet aggregation, or both. Details about the method of randomization, blinding of treatment allocation, scheduled duration of treatment, and, if, different,

scheduled duration of follow-up were requested of all trial coordinators.

The primary measure of outcome was a "serious vascular event" (i.e., non-fatal myocardial infarction, non-fatal stroke, or death from a vascular cause including deaths from an unknown cause). Deaths were divided into those with a vascular or non-vascular cause. Strokes were subdivided into intracranial hemorrhages (including intracerebral, subdural, subarachnoid, and extradural hemorrhages), ischemic strokes, and strokes of unknown etiology.

In addition to the meta-analysis from the Antithrombotic Trialists' Collaboration, the following trials relevant to antithrombotic therapy for noncardioembolic stroke were noted in the literature. The landmark trials primarily focused on aspirin and included: the International Stroke Trial Collaborative Group (1994); the Chinese Acute Stroke Trial Collaborative Group (1997); the European Stroke Prevention Study Group 2 (1997); the Canadian Cooperative Study Group (1978); the UK-TIA Study Group (1991); the Dutch TIA Study Group (1991); and the SALT Collaborative Group (1991). Three RCTs evaluated ticlopidine: the Canadian American Ticlopidine Study (1989), the Ticlopidine Aspirin Stroke Study (1989), and the African American Antiplatelet Stroke Prevention Study (2003). Clopidogrel was compared to aspirin alone in the Clopidogrel versus Aspirin in Patients at Risk of Ischemic Events (CAPRIE) trial (1996). The Management of Atherothrombosis with Clopidogrel in High-Risk Patients with Transient Ischemic Attacks or Ischemic Strokes (MATCH) trial (2004) evaluated the effectiveness of clopidogrel 75mg and aspirin 75 mg, compared with clopidogrel 75mg alone for stroke prevention. Clopidogrel for High Atherothrombotic Risk and Ischemic Stabilization, Management, and Avoidance (CHARISMA) trial (2006) and the Fast Assessment of Stroke and Transient ischemic attack to prevent Early Recurrence (FASTER) trial (2007) evaluated clopigogrel and aspirin in combination with aspirin alone. Four large RCTs evaluated the effectiveness of dipyridamole and aspirin among patients with stroke or transient ischemic attack: European Stroke Prevention Studies (ESPS-1 1987 and ESPS-2 1997); the European Australian Stroke Prevention in Reversible Ischemic Stroke (ESPRIT) trial (2006); and the Prevention Regimen for Effectively Avoiding Second Strokes (PRoFESS) trial (2008).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting antithrombotic therapy for secondary stroke prevention is high. Antithrombotic therapy post ischemic stroke is protective for high risk patients, such as, those with a history of prior stroke or vascular event. The body of evidence established by the Antithrombotic Trialists' Collaboration confirmed that prolonged antithrombotic therapy reduces the relative risk of stroke, myocardial infarction or death by approximately 22%. Risk of gastrointestinal hemorrhage or other major hemorrhage is the primary concern with ongoing therapy, although the studies have demonstrated that the risk is low and absolute benefits significantly outweigh the risks.

There was no appreciable evidence that either higher aspirin dose or any other antiplatelet regimen was more effective than low dose aspirin (75 mg to 150 mg) in preventing vascular events. Additionally, the body of evidence did not establish the optimal duration of treatment. The majority of studies reviewed lasted one to three years. The evidence seems to support that longer treatment might be more effective due to significant further benefit noted ($P<0.00001$) between year one and year three for most studies. Adding a second antithrombotic to aspirin may produce additional benefit; however, the evidence is inconclusive in this respect and more research recommended.

In reviewing the literature, there have been more studies conducted than included in the Antithombotic Trialists' meta-analysis. Some studies were not included in the meta-analysis due to the method of randomization chosen or small sample sizes. Antithrombotic medications other than aspirin have not been studied as extensively as aspirin.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that prolonged antithrombotic therapy reduces the risk of death in patients with a prior history of ischemic stroke. Based on these findings, antithrombotic therapy should be prescribed at discharge following acute ischemic stroke, unless there are contraindications to therapy.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence on the immediate hazards and net benefits of long-term antithrombotic therapy for the prevention of stroke recurrence. The Antithrombotic Trialists' Collaboration meta-analysis found a marginally significant ($P=0.04$) reduction in vascular mortality (7 deaths per 1,000 patients with a history of stroke or transient ischemic attack treated with antithrombotic therapy); however, the reduction in non-fatal vascular events and in all cause mortality was highly significant ($P=0.002$; 15 deaths per 1,000 patients

treated). These benefits exceeded the risk of bleeding (1-2 additional extracranial bleeds per 1,000 patients/year). On average, antithrombotic medications reduce the relative risk of stroke, MI, or death, but important differences exist between the various drugs in this category which directly impacts therapeutic selection.

Considering the cost of aspirin compared to the mean lifetime cost of ischemic stroke, estimated at $140,048 per person, antithrombotic therapy as a secondary stroke prevention strategy is clearly cost-effective. Gaspoz and colleagues (2002) concluded that the extension of aspirin therapy from the current levels of use to all eligible patients for 25 years would have an estimated cost-effectiveness ratio of about $11,000 per quality-adjusted year of life gained. The addition of clopidogrel for the 5 percent of patients who are ineligible for aspirin would cost about $31,000 per quality-adjusted year of life gained. Clopidogrel alone in all patients or in routine combination with aspirin had an incremental cost of more than $130,000 per quality-adjusted year of life gained and remained financially unattractive across a wide range of assumptions. However, clopidogrel alone or in combination with aspirin would cost less than $50,000 per quality-adjusted year of life gained if its price were reduced by 70 to 82 percent, to $1.00 and $0.60 per day, respectively.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of prolonged antithrombotic therapy post ischemic stroke is undisputed. No position against long-term antithrombotic therapy was noted in the literature. However, there is still not enough evidence to answer some questions. More randomized trials are needed to determine the optimal therapeutic agent(s) and regimen(s), as well as, the optimal duration of therapy.

1c.16 Quote verbatim, <u>the specific guideline recommendation</u> *(Including guideline # and/or page #)*:
2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 249.

Class I, Level of Evidence A

For patients with noncardioembolic ischemic stroke or TIA, the use of antiplatelet agents rather than oral anticoagulation is recommended to reduce the risk of recurrent stroke or another cardiovascular event.

Aspirin (50 mg/d to 325 mg/d) monotherapy (Class I, Level of Evidence A), the combination of aspirn 25 mg and extended-release dipyridamole 200 mg twice daily (Class I, Level of Evidence B), and clopidogrel 75 mg monotherapy daily (Class IIa, Level of Evidence B), are all acceptable options for initial therapy. The selection of an antiplatelet agent should be individualized on the basis of patient risk factor profiles, cost, tolerance, and other clinical characteristics.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on July 13, 20010. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence

from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0435_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. Studies have shown that antithrombotic therapy prescribed at discharge following acute ischemic stroke reduces stroke mortality and morbidity.

Healthcare organizations that track antithrombotic therapy prescribed at discharge for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
The use of antithrombotic therapy after ischemic stroke is recommended for secondary stroke prevention. Earlier evidence supported substantial underutilization of this therapy, particularly among the very elderly, those admitted from skilled nursing facilities, and patients with functional dependence (Lichtman JH, 2011). An analysis of Medicare data for 31,554 non-terminally ill patients with ischemic stroke randomly selected from the Medicare Health Care Quality Improvement Program's National Stroke Project (1998 to 1999, 2000 to 2001) demonstrated that only 74.2% were discharged on an antithrombotic medication. Treatment rates decreased with age and were lowest for patients' age 85-years and older. Later data demonstrates that this previous performance gap of 25% has narrowed significantly.

In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measurement requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-2 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 2034 denominator cases; 1995 numerator cases; 49 hospitals; 0.98083 national aggregate rate; 0.98731 mean of hospital rates; 0.2575 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.98601 25th percentile rate/lower quartile; and, 0.94737 10th percentile rate.

CY 2010: 19,889 denominator cases; 19,622 numerator cases; 137 hospitals; 0.98658 national aggregate rate; 0.97644 mean of hospital rates; 0.05765 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99711 50th percentile rate/median rate; 0.98276 25th percentile rate/lower quartile; and, 0.93436 10th percentile rate.

CY 2011: 24,053 denominator cases; 23,812 numerator cases; 157 hospitals; 0.98998 national aggregate rate; 0.97173 mean of hospital rates; 0.10346 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99803 50th percentile rate/median rate; 0.98529 25th percentile rate/lower quartile; and, 0.94915 10th percentile rate.

CY 2012: 24,420 denominator cases; 24,217 numerator cases; 158 hospitals; 0.99169 national aggregate rate; 0.98674 mean of hospital rates; 0.04061 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.98913 25th percentile rate/lower quartile; and, 0.97059 10th percentile rate.

CY 2013: 37,661 denominator cases; 37.363 numerator cases; 262 hospitals; 0.99209 national aggregate rate; 0.9885 mean of hospital rates; 0.02736 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.98913 25th percentile rate/lower quartile; and, 0.96667 10th percentile rate.

CY 2014: 180,048 denominator cases; 178,945 numerator cases; 1299 hospitals; 0.99387 national aggregate rate; 0.98632 mean of hospital rates; 0.06957 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.99254 25th percentile rate/lower quartile; and, 0.97674 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not applicable.

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to 75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had

a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer, et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Potential disparities in secondary pharmacological prevention for recurrent stroke have been identified. A study using the uniform data system for medical rehabilitation data from nursing homes in five states found that blacks or African Americans were significantly less likely to receive antithrombotic therapy (Ottenbacher KJ, et al, 2001). In a model adjusting for age, sex, physical function, and comorbidities, blacks or African Americans proved to be 80% as likely as whites to receive antithrombotic therapy.

Based on a national cross-sectional study of nursing home residents, the use of any antithrombotic (anticoagulant or antiplatelet) therapy was lower for Hispanics (45.5%), non-Hispanic blacks (49.4%), and Asian/Pacific Islanders (38.9%) than for whites (54.3%), although higher among a subsample of Native Americans (58.0%). Aspirin use was comparable across ethnic groups, and actually higher for Native American, blacks or African Americans, and Hispanic than for whites. In contrast, oral anticoagulation (warfarin) use was significantly lower for ethnic minority groups (25.4%-31.7%), except Native Americans whose proportion was only slightly lower (36.4%) than whites (39.6%)(Christian JB, et al. 2003).

Since the last endorsement date, Schwamm and colleagues (2010) found significant and important differences in quality of care related to antithrombotics at discharge when multivariate models were constructed adjusting for patient-level characteristics only. Race/ethnicity Black versus White: unadjusted OR 0.86 [95% CI 0.83-0.90]; adjusted for patient characteristics OR 0.81 [95% CI 0.78-0.85]; adjusted for patient and hospital characteristics OR 0.88 [95% CI 0.84-0.92]. Race/ethnicity Hispanic versus White: unadjusted OR 0.85 [95% CI 0.75-0.90]; adjusted for patient characteristics OR 0.80 [95% CI 0.75-0.86]; adjusted for patient and hospital characteristics OR 0.90 [95% CI 0.82-0.97]. Total N=46,515; All n 94.98%; White 95.15%; Black 94.41%; Hispanic 94.31%.

A more recently published study (Qian F, et al, 2013) from Get With The Guidelines (GWTG) also noted racial and ethnic disparities for antithrombotics at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association GWTG-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for discharged antithrombotic: non-Hispanic White (n=170,694) 95.3%; non-Hispanic Black (n=20,514) 94.3%; Hispanic (n=6632) 94.5%; and non-Hispanic Asian American (n=3060) 94.5%. Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) were similar for antithrombotic therapy at discharge (n=58,823) White 98.4%; Other Race 98.3% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20

deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$).168 (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Antithrombotic agents significantly reduce the incidence of a recurrent vascular event after a stroke. The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials (Kernan WN, et al, 2014; Sandercock P, et al, 2014)). While the use of these agents for patients with acute ischemic stroke and transient ischemic attacks continues to be the subject of study, substantial evidence is available from completed studies. Data at this time suggest that antithrombotic therapy should be prescribed at discharge following acute ischemic stroke to reduce stroke mortality and morbidity as long as no contraindications exist.

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
http://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1-635876076083056831.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Since the last endorsement date, the measure rationale for STK-02: Discharged on Antithrombotic Therapy was updated to address the use of novel oral anticoagulant drugs in stroke patients requiring antithrombotic therapy. In recent years, direct oral anticoagulant agents (DOACs) [A.K.A. novel oral anticoagulant agents (NOACs)] have been developed and approved by the U.S. Food and Drug Administration (FDA) for stroke prevention, and may be considered as an alternative to warfarin for select patients. Following FDA new drug approval of these agents, several DOACs were added to the medication table for antithrombotic medications (Appendix C, Table 8.2) used for abstraction of the measure.
All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must transition to a new set of codes for electronic health care transactions on October 1, 2015.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic stroke patients prescribed antithrombotic therapy at hospital discharge

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome

should be described in the calculation algorithm.
One data element is used to calculate the numerator:
• Antithrombotic Therapy Prescribed at Discharge – Documentation that antithrombotic therapy was prescribed at hospital discharge. Allowable values: Yes, No/UTD or unable to determine from medical record documentation.

Patients are eligible for the numerator population when the allowable value equals "yes" for the data element.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Ischemic stroke patients

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Nine data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Birthdate - The month, day and year the patient was born.
3. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
4. Comfort Measures Only – The earliest day the physician/APN/PA documented comfort measures only after hospital arrival. Allowable values: 1 (Day 0 or 1); 2 (Day 2 or after); 3 (Timing Unclear); 4 (Not Documented/UTD).
5. Discharge Date – The month day and year the patient was discharged from acute care, left against medical advice or expired during the stay.
6. Discharge Disposition – The place or setting to which the patient was discharged on the day of hospital discharge.
7. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
8. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.
9. Reason For Not Prescribing Antithrombotic Therapy at Discharge – Documentation of a reason for not prescribing antithrombotic therapy at discharge.
Allowable values: Yes or No/UTD.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic stroke as defined in Appendix A, Table 8.1.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
• Less than 18 years of age
• Length of Stay > 120 days
• Comfort measures only documented
• Enrolled in clinical trials related to stroke
• Admitted for elective carotid intervention
• Discharged to another hospital
• Left against medical advice
• Expired
• Discharged to home for hospice care
• Discharged to a health care facility for hospice care
• Documented reason for not prescribing antithrombotic therapy at discharge

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
• The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.

• The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is greater than 120 days, the patient is excluded.
• Patients with Comfort Measures Only allowable value of 1 (Day 0 or 1), 2 (Day 2 or after), and 3 (Timing unclear) are excluded.
• Patients are excluded if "Yes" is selected for Clinical Trial.
• Patients are excluded with ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3, if medical record documentation states that the patient was admitted for the elective performance of this procedure.
• Patients with Discharge Disposition allowable value of 2 (Hospice-Home), 3 (Hospice-Health Care Facility), 4 (Acute Care Facility), 6 (Expired), or 7 (Left Against Medical Advice/AMA) are excluded.
• Patients are excluded if "Yes" is selected for Reason For Not Prescribing Antithrombotic Therapy at Discharge.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable

S.16. **Type of score:**
Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check ICD-10-CM Principal Diagnosis Code
a. If the ICD-10-CM Principal Diagnosis Code is not on Table 8.1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the ICD-10-CM Principal Diagnosis Code is on Table 8.1, continue processing and proceed to Discharge Disposition.

3. Check Discharge Disposition
a. If Discharge Disposition equals 2, 3, 4, 6, 7, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If Discharge Disposition equals 1, 5, 8 continue processing and proceed to Comfort Measures Only.

4. Check Comfort Measures Only

a. If Comfort Measures Only is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Comfort Measures Only equals 1, 2, or 3, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Comfort Measures Only equals 4, continue processing and proceed to Clinical Trial.

5. Check Clinical Trial
a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

6. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Antithrombotic Therapy Prescribed at Discharge.

7. Check Antithrombotic Therapy Prescribed at Discharge
a. If Antithrombotic Therapy Prescribed at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Antithrombotic Therapy Prescribed at Discharge equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Antithrombotic Therapy Prescribed at Discharge equals No, continue processing and check Reason for Not Prescribing Antithrombotic Therapy at Discharge.

8. Check Reason for Not Prescribing Antithrombotic Therapy at Discharge
a. If Reason for Not Prescribing Antithrombotic Therapy at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Not Prescribing Antithrombotic Therapy at Discharge equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Reason for Not Prescribing Antithrombotic Therapy at Discharge equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
The Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45

If “N” 6-44, No sampling; 100% Initial Patient Population required
If “N” 0-5, Submission of patient level data is not required; if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Monthly Sample Size “n”, i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size “N” for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If “N >/= 300, then “n” 60
If “N 76-299, then “n” 20% of Initial Patient Population size
If “N 15-75, then “n” 15
If “N < 15, No sampling; 100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
0435_MeasureTesting_MSF5.0_Data-635905391748808958.doc

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0435 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability*.)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. It is a requirement of participation in the ORYX initiative that data on all measures in the set are collected. Demographics of organizations collecting and reporting data on this measure are as follows:
170 health care organizations representing various hospital demographics:
17 For Profit; 144 Not for Profit; 9 Government
62 >=300 beds; 71 100-299 beds; 37 <100 beds
142 Urban; 28 Rural
22 Teaching; 148 Non-teaching
States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI
15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:
At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers

- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:
- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:
Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 97.61%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-2.

Data Elements	Total 'n' numerator	Total 'n' denominator	Rate
Antithrombotic Therapy Prescribed at Discharge	442	460	96.1%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
Reason for Not Prescribing Antithrombotic Therapy at Discharge	10	11	91.0%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:
This measure focuses on determining the proportion of ischemic stroke patients who received a prescription for antithrombotic therapy at hospital discharge. Antithrombotic medications that qualify for inclusion in the numerator are detailed in medication Table 8.2 Antithrombotic Medications-Stroke. Medications other than those named cannot be included in the numerator. Medication tables are reviewed by a PharmD and revised twice a year. Patients less than 18 years of age that have a length of stay (LOS) more than 120 days, enrolled in a clinical trial for stroke or who were designated "comfort measures only" anytime during hospitalization are excluded. In addition, patients who were discharged to a health care facility for hospice care, home for hospice care, who expired or who left against medical advice are excluded to harmonize with other CMS/Joint Commission measures.

Operationally, there are two differences between the measure specifications and guideline recommendations. First, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure. Second, patients with a contraindication to antithrombotic therapy or a documented reason why therapy is not indicated are excluded from the measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:
At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding

appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of this measure. And finally, the conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:
Analysis of feedback obtained via our automated feedback system reveals 43 submissions regarding specifications for this measure over the past year. Predominantly, questions involve the data element Reason for Not Prescribing Antithrombotic Therapy at Discharge. Reasons for not prescribing antithrombotic therapy must be explicitly documented by the physician, advanced practice nurse, physician assistant, or pharmacists; however, medical record documentation does not always reflect the linkage of a reason with an antithrombotic drug. Questions about the acceptability of reason documentation are also common. In addition, many questions have been received regarding the acceptability of new anticoagulant agents, (i.e., dabigatran, rivaroxaban) for inclusion in the numerator population when prescribed at discharge. Both medications have been added to medication Table 8.2 Antithrombotic Medications-Stroke.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:
Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.
These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a length of stay (LOS) greater than 120 days
3. Patients with Comfort Measures Only documented
4. Patients enrolled in clinical trials
5. Patients admitted for Elective Carotid Intervention
6. Patients discharged to another hospital (acute care facility)
7. Patients who left against medical advice
8. Patients who expired
9. Patients discharged to home for hospice care
10. Patients discharged to a health care facility for hospice care
11. Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*
N=39,812

1. Patients < 18 years old = 0%
2. Patients who have a length of stay (LOS) greater than 120 days = 0%
3. Patients with Comfort Measures Only documented = 11.37%

4. Patients enrolled in clinical trials = 0.40%
5. Patients admitted for Elective Carotid Intervention = 10.19%
6. Patients discharged to another hospital (acute care facility) = 1.16%
7. Patients who left against medical advice = 0.26%
8. Patients who expired = 3.66%
9. Patients discharged to home for hospice care = 0.61%
10. Patients discharged to a health care facility for hospice care = 0.68%
11. Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge = 10.15%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:
Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:
Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:
Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:
The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:
STK-2 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	154	0.98351	0.07256	1	1	1	1	0.97674
2Q2011	155	0.97524	0.11930	1	1	1	1	0.96491

1Q2011	160	0.97249	0.10725	1	1	1	0.98833	0.94495
4Q2010	135	0.98048	0.06361	1	1	1	1	0.94286
3Q2010	130	0.96843	0.11476	1	1	1	0.98889	0.94291
2Q2010	122	0.97233	0.08071	1	1	1	0.97959	0.94203
1Q2010	99	0.97384	0.06745	1	1	1	0.97959	0.91667
4Q2009	49	0.98731	0.02575	1	1	1	0.98601	0.94737

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Multiple data sources are not used for this measure.

2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*:
Not applicable

2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*:
Not applicable

2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:
Although some evidence exists that minorities are less likely to receive antithrombotic therapy, there are no plans to stratify the measure. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data might be collected reliably in the future.

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met?
(*Reliability and Validity must be rated moderate or high*) Yes☐ No☐
Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b6)

2b2. VALIDITY TESTING
2b2.1. What level of validity testing was conducted? (*may be one or both levels*)
☐ **Critical data elements** (*data element validity must address ALL critical data elements*)

☐ **Performance measure score**

☒ **Empirical validity testing**

☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year of data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospital selection was based on those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospital patient level data from The Joint commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for stroke as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke (STK) process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:
N=1,318 hospitals
n= 2, 206,379 patients records

STK-2
Median: 100%
Percentile 10%: 98%
Percentile 25%: 99%
Percentile 75%: 100%
Percentile 90%: 100%

Pearson Correlation Coefficients Prob > |r| under H0: Rho=0 Number of Observations							
	STK_1	STK_2	STK_3	STK_4	STK_5	STK_6	STK_10
STK_1	1.00000 1318	0.55423 <.0001 1318	0.30311 <.0001 1302	0.37009 <.0001 1144	0.52785 <.0001 1318	0.53082 <.0001 1318	0.45291 <.0001 1318
STK_2	0.55423 <.0001 1318	1.00000 1318	0.37566 <.0001 1302	0.28169 <.0001 1144	0.53355 <.0001 1318	0.47326 <.0001 1318	0.29578 <.0001 1318
STK_3	0.30311 <.0001 1302	0.37566 <.0001 1302	1.00000 1302	0.25551 <.0001 1137	0.25665 <.0001 1302	0.28198 <.0001 1302	0.15819 <.0001 1302
STK_4	0.37009 <.0001 1144	0.28169 <.0001 1144	0.25551 <.0001 1137	1.00000 1144	0.22516 <.0001 1144	0.43717 <.0001 1144	0.41076 <.0001 1144
STK_5	0.52785 <.0001 1318	0.53355 <.0001 1318	0.25665 <.0001 1302	0.22516 <.0001 1144	1.00000 1318	0.35302 <.0001 1318	0.39079 <.0001 1318
STK_6	0.53082 <.0001 1318	0.47326 <.0001 1318	0.28198 <.0001 1302	0.43717 <.0001 1144	0.35302 <.0001 1318	1.00000 1318	0.45420 <.0001 1318
STK_10	0.45291 <.0001 1318	0.29578 <.0001 1318	0.15819 <.0001 1302	0.41076 <.0001 1144	0.39079 <.0001 1318	0.45420 <.0001 1318	1.00000 1318

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicate convergent validity of the measures.
STK-02 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with *Comfort Measures*
- Patient enrolled in a Clinical Trial

- Patients admitted for *Elective Carotid Intervention*
- Patients with a documented *Reason For Not Prescribing Antithrombotic Therapy at Discharge*
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are detailed below.

Exclusion: *Comfort Measures Only*
Overall Occurrence n = 163,225
Overall Occurrence Percentage: 10.4%
Minimum: 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Patients with a documented *Reason For Not Prescribing Antithrombotic Therapy at Discharge*
Overall Occurrence n = 19,751
Overall Occurrence Percentage: 6.27%
Minimum: 0.27%
10th Percentile 0.92%
Median: 2.82%
90th Percentile: 16.1%
Maximum: 60.6%

Exclusion: *Discharge Disposition* - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage: 35.7%
Minimum: 0.787%

10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: *Discharge Disposition* - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage: 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: *Discharge Disposition* - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage: 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: *Discharge Disposition* - Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage: 52.2%
Minimum: 6.25%
10th Percentile: 39%
Median: 51.9%
90th Percentile: 64%
Maximum: 94.3%

Exclusion: *Discharge Disposition* - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage: 3%
Minimum: 0.169%
10th Percentile: 0.87%
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance

results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age
Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days
Rationale: Included to harmonize with other CMS/Joint Commission aligned measures.

Patients with *Comfort Measures Only* documented
Rationale: It is inappropriate to treat such patients beyond those measures necessary for comfort.

Patients enrolled in a Clinical Trial
Rationale: Antithrombotic therapy as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require antithrombotic therapy.

Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge
Rationale: It is inappropriate to treat patients who have a documented reason or contraindication to antithrombotic therapy.

Patients discharged to another hospital
Rationale: This measure is meant for patients discharged to home or health care facility other than an acute care hospital.

Patients who left against medical advice
Rationale: Hospitals do not have opportunity for provision of quality care for the non-compliant patient.

Patients who expired
Rationale: Patients who expire are not eligible to be in this measure.

Patients discharged to home for hospice care
Rationale: Antithrombotic therapy may not be warranted for the hospice patient.

Patients discharged to a healthcare facility for hospice care
Rationale: Antithrombotic therapy may not be warranted for the hospice patient.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields. All data elements needed to compute the STK-2 performance measure score have been retooled for capture from electronic sources. Annual updates are performed to match the eCQM specifications to the current version of the chart-abstracted specifications.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting Quality Check® http://www.qualitycheck.org/consumer/searchQCR.aspx Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx Disease-Specific Care Certification for Primary Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

• Name of program and sponsor: Quality Check®; The Joint Commission
• Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
• Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ Medicare-certified hospitals (2015)

• Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
• Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
• Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

• Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
• Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

• Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
• Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

• Name of program and sponsor: Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

• Name of program and sponsor: Hospital Accreditation Program; The Joint Commission
• Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6

years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

• Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)

The rate of antithrombotic therapy prescribed at discharge has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 99.4%. A modest gap of ~3% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate of antithrombotic therapy at discharge published by GWTG-Stroke and PCNASR. Compared to antithrombotic at discharge rates of approximately 75% at the turn of the millennium (Lichtman JH, 2011), the performance gap has significantly narrowed. Significant and important differences between races in rates of antithrombotic therapy prescribed at discharge persist (Schwamm, 2010, Qian, 3013; CDC 2014).

• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1299 hospitals; 180,048 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
No issues have been identified.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures

Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0438 Antithrombotic Therapy By End of Hospital Day 2 is the fifth (STK-5) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in this measure than STK-2. STK-5 focuses on the early management of stroke care and antithrombotic therapy administered within the first 48 hours of acute ischemic stroke onset rather than discharge. All common data elements for these measures are completely harmonized. Measure 0068 is a physician performance measure and could extend to the outpatient setting. Measure 0068 encompasses a different target population, specifically patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI). As previously noted, this measure evaluate physician practice as opposed to hospital processes.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

To navigate the links in the worksheet: Ctrl + click link to go to the link; ALT + LEFT ARROW to return

Brief Measure Information

NQF #: 0436
Measure Title: STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients with atrial fibrillation/flutter who are prescribed anticoagulation therapy at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Stroke risk is significantly increased for patients with a history of or current finding of atrial fibrillation/flutter. Antiplatelet medications alone do not significantly reduce stroke risk for this patient population. Anticoagulation through the administration of warfarin, low molecular-weight heparins, or newer anticoagulant medications approved for stroke prevention is the recommended therapy.

Multiple clinical trials have demonstrated the superior therapeutic effect of warfarin compared with placebo in the prevention of thromboembolic events among patients with nonvalvular atrial fibrillation. Based on data pooled from 5 primary prevention trials of warfarin versus control, it is possible to reduce the annual stroke rate from 4.5% for the control patients to 1.4% in patients treated with dose-adjusted warfarin. In other words, 31 ischemic strokes can be prevented each year for every 1,000 patients treated (Sacco RL, et al., 2006).

Healthcare organizations that track anticoagulation therapy for internal quality improvement purposes have seen a significant increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e. FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic stroke patients prescribed anticoagulation therapy at hospital discharge
Denominator Statement: Ischemic stroke patients with documented atrial fibrillation/flutter.
Denominator Exclusions:
- Less than 18 years of age
- Length of Stay > 120 days
- Comfort measures only documented
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Discharged to another hospital
- Left against medical advice
- Expired
- Discharged to home for hospice care
- Discharged to a health care facility for hospice care

• Documented reason for not prescribing anticoagulation therapy at discharge

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence
Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012:

- The body of evidence consistently supports that the administration of anticoagulation therapy, unless there are contraindications, is an established and effective strategy in preventing recurrent stroke in high stroke risk atrial fibrillation patients with TIA or prior stroke.
- Class I, Level of Evidence A – 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 243
  - For patients with ischemic stroke or TIA with paroxysmal (intermittent) or permanent AF, anticoagulation with a vitamin K antagonist (target INR, 2.5; range 2.0 to 3.0) is recommended.
  - The Committee noted that the medical evidence to support anticoagulation therapy is not controversial;
  - however, there are some questions around the evidence for the timing of anticoagulant therapy.
- The 2012 Committee noted that the medical evidence to support anticoagulation therapy is not controversial; however, there are some questions around the evidence for the timing of anticoagulant therapy.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**
☐ **The developer provided updated evidence for this measure:**

Guidance from the Evidence Algorithm:
Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	136	150	149	257	1256
# cases (den)	2,952	3,566	3,685	5,635	28,0247
National aggregate rate	0.94	0.95	0.96	0.96	0.97
Mean hospital rate	0.92	0.93	0.95	0.95	0.97
50th percentile	1.00	1.00	1.00	1.00	1.00
10th and 90th percentiles	0.67 (10th) 1.00 (90th)	0.78 (10th) 1.00 (90th)	0.83 (10th) 1.00 (90th)	0.88 (10th) 1.00 (90th)	0.89 (10th) 1.00 (90th)

- Participation in this measure has grown significantly in the past five years. National hospital performance seems to be very high with little room for improvement.
- In 2012, the Committee noted that although the average performance rate for this measure was approximately 94%, there was evidence of a performance gap for minority populations.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Performance over five years has been consistently high. How much further improvement in performance is likely using this measure?*
- *Does a gap in care still exist that warrants this national performance measure?*
- *Is there evidence that a gap in care still exits for minority populations? How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **Note I did this before and the response was discarded by the system. I'll do again but briefly now.

**Process measure. Direct. relates to desired outcome indirectly; measures the institution of AC after stroke where Afib is present. implied connection with desired outcome of reduction of stroke without side effects such as major bleeding.

**No new studies/information since 2012

**Strong evidence - no changes. No need for discussion or vote

1b. Performance Gap

Comments: **Limited gap. has improved in hospital performance past 5 years. perhaps some subgroup gaps but data given do not document a major gap.

**High participation 97%

**Participation rate is up - modest room for improvement. No data on disparities. The gap may not warrant the measure. Or it may be that the known disparities in stroke care account for much of the remaining performance gap - in which case the continuation of the measure is warranted to help address disparities.

1c. High Priority (previously referred to as High Impact)

Comments: **NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- One data element defines the numerator and 10 data elements define the denominator.
- Developer reports that "Since the last endorsement date, the measure rationale for STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter was updated to address the use of novel oral anticoagulant drugs in stroke patients requiring anticoagulation therapy. In recent years, direct oral anticoagulant agents (DOACs) [A.K.A. novel oral anticoagulant agents (NOACs)] have been developed and approved by the U.S. Food and Drug Administration (FDA) for stroke prevention, and may be considered as an alternative to warfarin for select patients. Following FDA new drug approval of these agents, several DOACs were added to the medication table for anticoagulant medications (Appendix C, Table 8.3) used for abstraction of the measure."
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke).
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.

- The measures is specified at the hospital level of analysis.

Questions for the Committee :

- *Are changes to the measure specifications appropriate?*
- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

For maintenance measures, summarize the reliability testing from the prior review:

- Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 98.1%.
  - Four data elements found >95% agreement: Afib/flutter (95.5%), Clinical Trial (99.7%), Comfort Measures Only (99.3%), and Elective Carotid Intervention (99.6%). No Kappa scores were presented.

- In 2012, the Committee voiced some concern that the measure submission did not specify the agents that could be used to meet the measure.
- One Committee member noted that atrial fibrillation is under-diagnosed, and therefore this measure could potentially miss many patients who should be treated. The developer clarified that the measure includes any patient for whom atrial fibrillation is documented during the hospital stay or for whom there is any documentation of past history of atrial fibrillation or flutter.
- The Committee also expressed concern about the relatively low rate of agreement (85%) for the numerator data element reliability testing. The developer explained that some of the newer anticoagulants were not on the abstractors' lists when the reliability testing was done and this likely contributed to the lower rates of agreement between the raters.

Describe any updates to testing: No new information provided

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing: see above

Results of reliability testing : see above

Guidance from the Reliability Algorithm :

Precise specifications (Box 1) →empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9)→ high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

Question for the Committee:
- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

For maintenance measures, summarize the validity testing from the prior review:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users that is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions regarding clarification of the data element Afib/flutter were most common. In addition, developers received questions regarding acceptability of new anticoagulant agents.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING
Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:
- ☐ **Face validity only**
- ☒ **Empirical validity testing of the measure score**

Validity testing method:
- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:
- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:
- *Is the test sample adequate to generalize for widespread implementation?*

- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:
  - Patients less than 18 years of age
  - Patient who have a Length of Stay greater than 120 days
  - Patients with Comfort Measures
  - Patient enrolled in a Clinical Trial
  - Patients admitted for Elective Carotid Intervention
  - Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge
  - Patients discharged to another hospital
  - Patients who left against medical advice
  - Patients who expired
  - Patients discharged to home for hospice care
  - Patients discharged to a health care facility for hospice care
- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Comfort Measures Only: 10.4% (range 0.30-35.7%)
  - Clinical Trial: 0.25% (range 0.08-35.5%)
  - Patients admitted for Elective Carotid Intervention: 11.8% (range 0.16-95.2%)
  - Patients with a documented Reason For Not Prescribing Antithrombotic Therapy at Discharge: 6.27% (range 0.27%-60.6%)
  - Patients discharged to another hospital: 35.7% (range 0.79-76.2%)
  - Patients who left against medical advice: 0.67% (range 0.06-9.67%)
  - Patients who expired: 6.04% (range 0.39-20.1%)
  - Patients discharged to home for hospice care: 52.2% (range 6.25-94.3%)
  - Patients discharged to a health care facility for hospice care: 3% (range 0.16-23%)

Questions for the Committee:

- *In this sample approximately half of the patients are excluded. Does the large number of exclusions for Patients discharged to home for hospice care pose a threat to validity of the measure?*
- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →moderate confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **valid measure of the process.
**No concerns
**Specifications are clear and appropriate.
**Well defined.
**Changes to specifications appropriate.

2a2. Reliability Testing

Comments: **valid. correlates with other stroke hospital measures which indicate quality care.
**New testing data adequate
**Very high - face validity and new empirical validity test. Possible issues of novel anti-coagulation agents and disparity data should be examined in the future.
**reliable
**Previous reliability testing appropriate

2b2. Validity Testing

Comments: **The exclusions omit large % of at risk population but all make sense. Institution of ac in comfort care or hospice population not likely. Single concern was not capturing ac in patients transferred.
**New data exclusions are large >50% of pts excluded
would like to discuss whether this is appropriate given the purpose of the measure
**Discharged to another hospital are high - mentioned later that this really means discharged to home?????? If so, these should also be included in the numerator.
Overall high exclusion rates.
Little to identify meaningful differences.
Missing data are handled, but no identification of frequency.
**Valid. Correlates with other stroke hospital measures which indicate quality care.
**New testing data adequate

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **reliable
**Previous reliability testing approriate
**Inter-rater 98.1%. Also high on exclusions.
**The exclusions omit large % of at risk population but all make sense. Institution of ac in comfort care or hospice population not

likely. Single concern was not capturing ac in patients transferred.
**New data exclusions are large >50% of pts excluded would like to discuss whether this is appropriate given the purpose of the measure

Criterion 3. Feasibility
Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available.
- Some data elements are in electronic form.
- Data collection burden is significant.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Feasible but needs chart review to determine eligibility for the measure. stroke diagnosis and AC medication and afib dx available in EHR as extractable element .

**No concerns

**In chart or EHR. Data collection and reporting may be a burden which needs to be weighed with continued contribution to quality.

Criterion 4: Usability and Use
Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CMS Hospital Compare: Public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and

recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.

- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer provided the following progress information on 1,256 hospitals nationwide and 28,027 patients:
  - The rate of anticoagulation therapy for atrial fibrillation has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 97.2%. A gap of approximately 12% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate of anticoagulation for atrial fibrillation published by GWTG-Stroke and PCNASR.
- Non-Hispanic black patients continue to be an underserved population (Schwamm, 2010, Qian, 3013; CDC 2014). Women are also less likely to receive anticoagulation therapy for atrial fibrillation (Bushnell, et al, 2014).

Unexpected findings (positive or negative) during implementation: The developer did not identify any unexpected findings during implementation.

Potential harms:

- Novel oral anticoagulant drugs (NOACs) have been added to the list of comprehensive anticoagulant medications for stroke (Appendix C, Table 8,3) as they have become approved by the FDA. Although some adverse events have been associated with the NOACs and reported in the literature, e.g., increased incidence of myocardial infarction with dabigatran, no unintended negative consequences have been reported with the addition of the warfarin-alternative agents as a result of ongoing data collection.

Feedback :

- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Multiple reporting organizations.

**No concerns

**Data are reported. There is still a 12% gap in the bottom 10% so room for improvement is there, could be disparity related. Need to address Novel Anti-Coagulants and potential differences in efficacy - including possible differences is varied populations.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 1525 : Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

- 0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation – AMA-PCPI – no longer NQF endorsed
- 0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge – AAN – no longer endorsed
- 0624 : Atrial Fibrillation - Anticoagulation Therapy – ActiveHealth Management – not NQF endorsed

Harmonization :

- The target population for measure 1525 differs from measure 0436 Anticoagulation Therapy for Atrial Fibrillation/Flutter in that it includes in the denominator population all patients age 18 years and older with a diagnosis of nonvalvular atrial fibrillation or atrial flutter whose assessment of the specified thromboembolic risk factors indicate one or more high-risk factors or more than one moderate risk factor, as determined by CHADS2 risk stratification. It is not specified for ischemic stroke patients with atrial fibrillation/flutter only.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0436 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent a secondary stroke attributable to a thromboembolic event resulting from atrial fibrillation following a new ischemic stroke.
Anticoagulation therapy prescribed at discharge >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for prevention of stroke in patients with ischemic stroke or transient ischemic attack. Both persistent atrial fibrillation and paroxysmal atrial fibrillation are potent predictors of first and recurrent stroke. Data from clinical trials show that age, recent congestive heart failure, hypertension, diabetes, and prior thromboembolism have been found to identify high-risk groups for atrial thromboembolism among patients with atrial fibrillation. Left ventricular dysfunction, left atrial size, mitral annular calcification (MAC), spontaneous echo contrast, and left atrial thrombus by echocardiography have also been shown to predict increased thromboemoblic risk. Overall, patients with prior stroke carry the highest stroke risk (RR, 2.5) (Sacco RL, et al., 2006).

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: Between 1990 and 2006, a total of 24 randomized trials (RCTs) involving patients with non-valvular atrial fibrillation were published. Collectively, these RCTs represent 20,012 participants with an average follow-up of 1.6 years, and a total exposure of about 32,800 patient-years (Fuster V, et al., 2006).

A meta-analysis of six randomized trials (Hart RG, et al.1999) conducted between 1989 and 1993 showed that adjusted dose-warfarin is highly efficacious for prevention of all stroke (both ischemic and hemorrhagic), with a risk reduction of 61% (95% CI 47% to 71%) versus placebo. The duration of follow-up was generally between 1 and 2 years; the longest was, 2.2 years. Five of the six RCTs, focused on primary prevention of thromboembolism in patients with nonvavlular atrial fibrillation, (i.e., The Copenhagen AFASAK Study (AFSAK); Stroke Prevention in Atrial Fibrillation (SPAF I); The Boston Area Anticoagulation Trial for Atrial Fibrillation (BAATAF); the Canadian Atrial Fibrillation Anticoagulation (CAFA) Study; and, the Veteran Administration Stroke Prevention in Non-Rheumatic Atrial Fibrillation (VA-SPINAF). One trial, the European Atrial Fibrillation Trial (EAFT), specifically studied secondary prevention among patients who had survived nondisabling stroke or cerebral transient ischemic attack (TIA). Findings from primary prevention studies were extrapolated and applied to secondary prevention.

A Cochrane review of anticoagulants for preventing stroke in patients with nonrheumatic atrial fibrillation and a history of stroke or transient ischemic attack published in The Cochrane Library 2011, Issue 4, focused specifically on two of the above RCTs: EAFT and the VA-SPINAF. The search strategy employed the Cochrane Stroke Group Trials Register (June 9, 2003), and contacted

researchers in the field to identify any further published or non-published studies. Selection criteria involved randomized trials comparing oral anticoagulants with control (no therapy) or placebo in people with NRAF and a previous TIA or minor ischemic stroke. Control groups on aspirin did not meet search criteria. These two trials involved 485 participants. Although VA-SPINAF was a primary prevention study, a small proportion of patients had suffered a previous stroke or TIA and the results for these patients were reported separately. The review considered the following main outcomes: fatal or non-fatal (disabling or non-disabling) recurrent stroke; all major vascular events: vascular death (including fatal bleeds), recurrent stroke (both ischemic and hemorrhagic), myocardial infarction, and systemic embolism; any intracranial bleed; and, major extracranial bleed defined as severe enough to lead to hospital admission, blood transfusion, or surgery (Saxena R, Koudstaal PJ, 2011).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting anticoagulation for stroke prevention in patients with NRAF is high. The Cochrane Review of EAFT and VA-SPINAF determined that in patients with NRAF and a recent TIA or minor ischemic stroke, oral anticoagulation therapy almost halves the odds of serious vascular event. The odds of recurrent stroke, disabling as well as non-disabling, is decreased by two-thirds. In the EAFT group of patients without contraindications to anticoagulants, the annual rate of all vascular events was 8% in patients assigned to anticoagulants (n=225) versus 17% in patients assigned to placebo (n=214). The risk of stroke was reduced from 12% to 4% per year. In other words, 90 vascular events (mainly strokes) were prevented per 1000 patients treated with anticoagulants per year. The incidences of bleeding events (major or minor, intracranial or extracranial) on anticoagulation was low (2.8% per year versus 0.7% per year in the placebo group). In the VA-SPINAF study, four patients in the placebo group (n=25) compared to two in the anticoagulant group (n=21) suffered a recurrent stroke. The number of all vascular events was 8/21 in the warfarin group versus 11/25 in the placebo group (OR 0.78, 95% CI 0.20 to 2.9). No intracranial bleeds occurred. The recurrence of stroke of 9.3% per year in the placebo group, and the odds reduction by anticoagulant therapy, were very similar to those found in the EAFT.

The results of secondary prevention studies are highly similar to those of the five primary prevention studies of NRAF patients who did not have an ischemic stroke or TIA (n=4052). The most important difference between the primary and secondary prevention studies is the much higher incidence of recurrent stroke. The secondary prevention studies observed an annual incidence of 12% in the placebo group, which is nearly three times as much as in the placebo treated groups of the primary prevention studies (4.5% per year). This makes the value of anticoagulation for secondary prevention even more impressive in absolute terms: 90 vascular events (mainly strokes) are prevented if 1000 patients are treated for one year. Compared with aspirin, oral anticoagulants significantly decrease the risk of all strokes, ischemic strokes, and cardiovascular events with only a modest increase in bleeding risk. According to Van Walraven (2002), stroke risk for patients treated with aspirin alone was 10% per year for patients with a prior history of stroke and 2.7% for those with no such history versus 4% and 1.5% respectively for patients receiving anticoagulation therapy.

The Cochrane reviewers identified several flaws in EAFT. First, anticoagulant treatment was not blinded. Second, the results of the five primary prevention trials were published while EAFT was in progress. This could have biased both EAFT Auditing Committee and the individual investigators. Hospital admission for a major extracranial bleed might have been more likely for patients on an anticoagulant. However, all members of the Audit Committee who assessed the outcomes were absolutely blinded for the assigned study treatment. Finally, the majority of recurrent vascular events in EAFT were major, which left little room for inter-observer variation.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that the administration of anticoagulation therapy, unless there are contraindications, is an established and effective strategy in preventing recurrent stroke in high stroke risk atrial fibrillation patients with TIA or prior stroke.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence that oral anticoagulants are beneficial and safe for preventing a second stroke in people with atrial fibrillation and prior stroke. The literature examined reveals that patients with NRAF and a recent TIA or minor ischemic stroke who are prescribed oral anticoagulation therapy have a 50% decrease in the odds of a second serious vascular event. The odds of recurrent stroke, disabling as well as non-disabling, is also decreased by two-thirds. Patients with atrial fibrillation have an irregular heart beat and, if not properly anticoagulated, this can cause the formation of a blood clot in the left atrium of the heart. This clot may break away and block a cerebral artery causing a stroke. Patients who have had a stroke in the presence of NRAF have a high risk of another stroke. Anticoagulant drugs, such as warfarin, make the blood thinner and prevent formation of blood clots and hence could prevent stroke. However, anticoagulant drugs may also cause bleeding in the brain and this complication could offset any benefits.

However, examination of the literature reveals that many studies do not provide information on the balance between risk and benefit of anticoagulation therapy in the early period after stroke onset in patients with atrial fibrillation. Several studies have recommended withholding anticoagulants during the first few days post stroke, especially in cases of large infarcts. In one trial involving 449 patients with ischemic stroke and atrial fibrillation, a low-molecular-weight heparin did not reduce recurrent stroke risk during the first 14 days (Berge, et al, 2000). Another large trial of similar patients (N=3169) receiving subcutaneous unfractionated heparin, the risk of recurrent ischemic stroke within the first 14 days was reduced by 50%; however, an increase in spontaneous intracerebral hemorrhage offset the benefit
(Saxena, et al., 2001). Conclusions from these studies continue to recommend oral anticoagulation treatment as secondary prevention for those patients' who have no contraindication.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: There is some uncertainty as to when anticoagulation therapy should be initiated for patients with atrial fibrillation following a stroke. As noted above, one study found an increased risk of intracerebral hemorrhage when anticoagulant therapy was initiated within the first 14 days post stroke; however, it is generally recommended that anticoagulation therapy be initiated within the first one to two weeks. Although the absolute benefits of anticoagulation are higher in secondary prevention, it remains undisputed that the risk of stroke warrants the use of warfarin in all patients with atrial fibrillation, unless contraindicated. The benefit of unfractionated and low molecular-weight heparins over warfarin, as well as target INR value, is somewhat controversial.

1c.18 National Guideline Clearinghouse or other URL: http://stroke.ahajournals.org/content/42/1/227.full.pdf

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on July 13, 2010. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0436_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Stroke risk is significantly increased for patients with a history of or current finding of atrial fibrillation/flutter. Antiplatelet medications alone do not significantly reduce stroke risk for this patient population. Anticoagulation through the administration of warfarin, low molecular-weight heparins, or newer anticoagulant medications approved for stroke prevention is the recommended therapy.

Multiple clinical trials have demonstrated the superior therapeutic effect of warfarin compared with placebo in the prevention of thromboembolic events among patients with nonvalvular atrial fibrillation. Based on data pooled from 5 primary prevention trials of warfarin versus control, it is possible to reduce the annual stroke rate from 4.5% for the control patients to 1.4% in patients treated with dose-adjusted warfarin. In other words, 31 ischemic strokes can be prevented each year for every 1,000 patients treated (Sacco RL, et al., 2006).

Healthcare organizations that track anticoagulation therapy for internal quality improvement purposes have seen a significant increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e. FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measurement requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-3 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 325 denominator cases; 303 numerator cases; 43 hospitals; 0.93231 national aggregate rate; 0.90522 mean of hospital rates; 0.22409 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.875 25th percentile rate/lower quartile; and, 0.8 10th percentile rate.

CY 2010: 2952 denominator cases; 2785 numerator cases; 136 hospitals; 0.94343 national aggregate rate; 0.92168 mean of hospital rates; 0.13488 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.90767 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2011: 3566 denominator cases; 3381 numerator cases; 150 hospitals; 0.94812 national aggregate rate; 0.92886 mean of hospital rates; 0.13698 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.90625 25th percentile rate/lower quartile; and, 0.7735 10th percentile rate.

CY 2012: 3685 denominator cases; 3530 numerator cases; 149 hospitals; 0.95794 national aggregate rate; 0.94795 mean of hospital rates; 0.11113 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.95522 25th percentile rate/lower quartile; and, 0.83333 10th percentile rate.

CY 2013: 5635 denominator cases; 5429 numerator cases; 257 hospitals; 0.96344 national aggregate rate; 0.95363 mean of hospital

rates; 0.1165 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.95349 25th percentile rate/lower quartile; and, 0.88235 10th percentile rate.

CY 2014: 28,027 denominator cases; 27,261 numerator cases; 1256 hospitals; 0.97267 national aggregate rate; 0.96598 mean of hospital rates; 0.08548 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 1.0 50th percentile rate/median rate; 0.96429 25th percentile rate/lower quartile; and, 0.88889 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not Applicable

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not Applicable

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to 75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years if age:

RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012). Although blacks and African Americans have a lower incidence of atrial fibrillation than Non-Hispanic whites (Hajat, et al. 2001), blacks and African Americans are also less likely to undergo cardiac monitoring and noninvasive cerebrovascular testing (Mitchell, et al., 2000). In REGARDS, investigators found that blacks or African Americans were less likely to be aware that they had atrial fibrillation or to be treated with warfarin.

Furthermore, minorities are less likely to receive medications for secondary prevention. One report suggests that blacks or African Americans are less likely to have thorough diagnostic evaluation after first stroke and are less likely to receive guideline-concordant stroke preventive medications, such as warfarin or other anticoagulants. In another study which used the 2005 Behavioral Risk Factor Surveillance System (BRFSS) in 11, 862 stroke survivors, little difference was found among blacks or African Americans and non-Hispanic whites in terms of secondary prevention measures. The study found that secondary prevention measures were underutilized in both racial groups.

Studies have also noted a relationship between health literacy, particularly math skills and medication compliance. A study from Estrada and colleagues (2004), found that anticoagulation control was poorer for participants with lower literacy levels. The international normalized ratio (INR) was 32% higher for participants in the lowest literacy group versus the highest (P+0.009). Other studies have found no association between literacy and the proportion of time with the INR in the therapeutic range (OR 1.0, 95% CI 0.7 to 1.4); however, no genetic factors influencing response to anticoagulation were included in the analysis (Fang MC, et al., 2006).

Since the last endorsement date, Schwamm and colleagues (2010) reported that black patients had significantly lower adjusted odds compared with white patients of receiving anticoagulation for atrial fibrillation (OR, 0.84; 95% CI, 0.75 to 0.94). Findings from Qian and associates (2013) agreed that non-Hispanic black patients were less likely to receive anticoagulation for atrial fibrillation at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, Qian reported the following performance measure rates for discharged on anticoagulation for atrial fibrillation: non-Hispanic White (n=170,694) 90.0%; non-Hispanic Black (n=20,514) 88.3%; Hispanic (n=6632) 89.0%; and non-Hispanic Asian American (n=3060) 90.3%. According to data from the Paul Coverdell National Acute Stroke Registry (PCNASR) (n=9358), patients who are not white are less likely to receive anticoagulation therapy for atrial fibrillation; White 96.2%; Other Race 94.0% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

White women with atrial fibrillation, as well as women of other races with atrial fibrillation, are slightly less likely to receive anticoagulation therapy than men (88% versus 89.7%; adjusted OR, 0.93; 95% CI, 0.88–0.98) (Bushnell, 2014). The attributable risk of stroke from atrial fibrillation increases with age, from 1.5% for those aged 50 to 59 years to nearly 25% for those aged =80 years. Whites carry the highest prevalence of atrial fibrillation compared with blacks, Hispanics, Asians, and other ethnic groups. The overall number of men and women with atrial fibrillation is similar, but ˜60% of atrial fibrillation patients aged >75 years are women (15.6% of men and 20.4% of women (P<0.0001).

1c. High Priority (previously referred to as High Impact)
The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare
Affects large numbers, A leading cause of morbidity/mortality
1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.
Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States is still attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths in 2008 (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 (P<0.05), (US Burden of Disease Collaborators, 2013). Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Approximately 20% of ischemic strokes result from a cerebral embolism secondary to a cardiac arrhythmia or disorder. Atrial fibrillation (AF) is the most common sustained cardiac rhythm disturbance (CDC, 2010). Paroxysmal, persistent, and permanent atrial fibrillation are strong predictors of first and recurrent stroke, increasing ischemic stroke risk four to five-fold. It is estimated that over 2.3 million Americans have atrial fibrillation, and the incidence becomes more prevalent with age. AF accounts for ˜ 1.5% of stroke in individuals 50 to 59 years of age to nearly 25% in those aged > 80 years (Bushnell C, et al., 2014).

Patients who have suffered an ischemic stroke who have a high-risk source of cardiogenic embolism should generally be treated with anticoagulant drugs to prevent reoccurrence. For most patients with ischemic stroke and atrial fibrillation, it is reasonable to initiate anticoagulation therapy within 14 days of stroke onset (Kernan WN, eta l, 2014). Warfarin, dabigatran, and apixaban are all indicated for the prevention of recurrent stroke in patients with nonvalvular atrial fibrillation, whether paroxysmal or permanent. Rivaroxaban is a reasonable alternative (Kernan WN, 2014). Ischemic stroke rates per 1000 patient-years declined in AF patients taking anticoagulants, from 46.7% in 1992 to 19.1% in 2002 (AHA 2012). According to the Framingham Study (1996), AF is also an independent risk factor for ischemic stroke severity, recurrence, and mortality (Lin HJ, et al., 1996). In a study from Penado and associates (2003), people who had AF and were not treated with anticoagulants had a 2.1-fold increase in risk for recurrent stroke and a 2.4-fold increase in risk for recurrent severe stroke.

In addition to the costs attributed to stroke, the treatment of atrial fibrillation alone represents a significant health care burden. The estimated cost of treatment of atrial fibrillation in 2005 was $6.65 billion per year, including the costs of hospitalization, inpatient and outpatient physician care, and medications (Roger VL, et al.,2012).

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not Applicable

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
http://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1-635882183961489008.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Since the last endorsement date, the measure rationale for STK-03: Anticoagulation Therapy for Atrial Fibrillation/Flutter was

updated to address the use of novel oral anticoagulant drugs in stroke patients requiring anticoagulation therapy. In recent years, direct oral anticoagulant agents (DOACs) [A.K.A. novel oral anticoagulant agents (NOACs)] have been developed and approved by the U.S. Food and Drug Administration (FDA) for stroke prevention, and may be considered as an alternative to warfarin for select patients. Following FDA new drug approval of these agents, several DOACs were added to the medication table for anticoagulant medications (Appendix C, Table 8.3) used for abstraction of the measure. Abstraction guidelines for the data element Atrial Fibrillation/Flutter were also modified to address questions received from data abstractors regarding conflicting documentation, questionable episodes of atrial fibrillation, and patients discharged from the hospital with cardiac monitoring for screening purposes only.

All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must transition to a new set of codes for electronic health care transactions on October 1, 2015

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic stroke patients prescribed anticoagulation therapy at hospital discharge

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
One data element is used to calculate the numerator:

- Anticoagulation Therapy Prescribed at Discharge – Documentation that anticoagulation therapy was prescribed at hospital discharge. Allowable values: Yes, No/UTD or unable to determine from medical record documentation.

Patients are eligible for the numerator population when the allowable value equals "yes" for the data element.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Ischemic stroke patients with documented atrial fibrillation/flutter.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Ten data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Atrial Fibrillation/Flutter – Documentation that the patient has a history of any atrial fibrillation (e.g., remote, persistent, or paroxysmal) or atrial flutter in the past OR current atrial fibrillation or flutter on EKG.
Allowable values: Yes or No/UTD.
3. Birthdate - The month, day and year the patient was born.
4. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
5. Comfort Measures Only – The earliest day the physician/APN/PA documented comfort measures only after hospital arrival.
Allowable values: 1 (Day 0 or 1); 2 (Day 2 or after); 3 (Timing Unclear); 4 (Not Documented/UTD).
6. Discharge Date – The month, day and year the patient was discharged from acute care, left against medical advice or expired during the stay.

7. Discharge Disposition – The place or setting to which the patient was discharged on the day of hospital discharge.
8. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
9. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.
10. Reason For Not Prescribing Anticoagulation Therapy at Discharge – Documentation of a reason for not prescribing anticoagulation therapy at discharge.
Allowable values: Yes or No/UTD.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic stroke as defined in Appendix A, Table 8.1, and patients with documented Atrial Fibrillation/Flutter.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
- Less than 18 years of age
- Length of Stay > 120 days
- Comfort measures only documented
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Discharged to another hospital
- Left against medical advice
- Expired
- Discharged to home for hospice care
- Discharged to a health care facility for hospice care
- Documented reason for not prescribing anticoagulation therapy at discharge

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
- The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.
- The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is greater than 120 days, the patient is excluded.
- Patients with Comfort Measures Only allowable value of 1 (Day 0 or 1), 2 (Day 2 or after), and 3 (Timing unclear) are excluded.
- Patients are excluded if "Yes" is selected for Clinical Trial.
- Patients are excluded with the following ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3, if medical record documentation states that the patient was admitted for the elective performance of this procedure.
- Patients with Discharge Disposition allowable value of 2 (Hospice-Home), 3 (Hospice-Health Care Facility), 4 (Acute Care Facility), 6 (Expired), or 7 (Left Against Medical Advice/AMA) are excluded.
- Patients are excluded if "Yes" is selected for Reason For Not Prescribing Anticoagulation Therapy.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*

Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. Detailed risk model specifications (*if not provided in excel or csv file at S.2b*)
Not Applicable

S.16. Type of score:
Rate/proportion
If other:

S.17. Interpretation of Score *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. Calculation Algorithm/Measure Logic *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check ICD-10-CM Principal Diagnosis Code
a. If the ICD-10-CM Principal Diagnosis Code is not on Table 8.1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the ICD-10-CM Principal Diagnosis Code is on Table 8.1, continue processing and proceed to Discharge Disposition.

3. Check Discharge Disposition
a. If Discharge Disposition equals 2, 3, 4, 6, 7, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If Discharge Disposition equals 1, 5, 8, continue processing and proceed to Comfort Measures Only.

4. Check Comfort Measures Only
a. If Comfort Measures Only is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Comfort Measures Only equals 1, 2, or 3, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Comfort Measures Only equals 4, continue processing and proceed to Clinical Trial.

5. Check Clinical Trial
a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

6. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Atrial Fibrillation/Flutter.

7. Check Atrial Fibrillation/Flutter.
a. If Atrial Fibrillation/Flutter is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Atrial Fibrillation/Flutter equals No, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If Atrial Fibrillation/Flutter equals Yes, continue processing and check Anticoagulation Therapy Prescribed at Discharge.

8. Check Anticoagulation Therapy Prescribed at Discharge.
a. If Anticoagulation Therapy Prescribed at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Anticoagulation Therapy Prescribed at Discharge equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Anticoagulation Therapy Prescribed at Discharge equals No, continue processing and check Reason for Not Prescribing Anticoagulation Therapy at Discharge.

9. Check Reason for Not Prescribing Anticoagulation Therapy at Discharge.
a. If Reason for Not Prescribing Anticoagulation Therapy at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Not Prescribing Anticoagulation Therapy at Discharge equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If Reason for Not Prescribing Anticoagulation Therapy at Discharge equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:

If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45
If "N" 6-44, No sampling,then 100% Initial Patient Population required
If "N" 0-5, Submission of patient level data is not required, if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size for "N" for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:

If "N" >/= 300, then "n" 60
If "N" 76-299, then "n" 20% of Initial Patient Population size
If "N" 15-75, then "n" 15
If "N" < 15, No sampling;100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not Applicable

2b. Validity – See attached Measure Testing Submission Form
0436_MeasureTesting_MSF5.0_Data-635905394179647704.doc

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0436 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)

Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability*.)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:

This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on this measure are as follows:

170 health care organizations representing various hospital demographics:

17 For Profit; 144 Not for Profit; 9 Government

62 >=300 beds; 71 100-299 beds; 37 <100 beds

142 Urban; 28 Rural

22 Teaching; 148 Non-teaching

States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI

15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:

At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of

data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:

Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:

Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 to 3Q2011) have shown an overall agreement rate of 98.1%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-3.

Data Elements	total 'n' numerator	total 'n' denominator	rate
Anticoagulation Therapy Prescribed at Discharge	127	150	84.7%
Atrial Fibrillation/Flutter	446	467	95.5%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
Reason for Not Prescribing Anticoagulation			

Therapy at Discharge	38	46	82.6%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:

This measure focuses on determining the proportion of ischemic stroke patients with atrial fibrillation/flutter who are prescribed anticoagulation therapy at hospital discharge. These specifications are consistent with the AHA guideline recommendations for long-term anticoagulation therapy rather than antiplatelet therapy for atrial fibrillation patients with a recent ischemic stroke.

Anticoagulant medications that qualify for inclusion in the numerator are detailed in medication Table 8.3 Anticoagulant Medications for Stroke. Patients prescribed medications other than those named cannot be included in the numerator. Medication tables are reviewed by a PharmD member of the technical advisory panel (TAP) and updated twice year. Patients less than 18 years of age that have a length of stay (LOS) more than 120 days, enrolled in a clinical trial for stroke or who were designated "comfort measures only" anytime during hospitalization are excluded. In addition, patients who were discharged to a health care facility for hospice care, home for hospice care, who expired or who left against medical advice are excluded to harmonize with other CMS/Joint Commission measures.

Operationally, there are two differences between the measure specifications and guideline recommendations. First, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure. Second, patients with a contraindication to anticoagulation therapy or a documented reason why therapy is not indicated are excluded from the measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:

As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:

At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends

and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of this measure. And finally, the conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:

Analysis of feedback obtained via our automated feedback system reveals 63 submissions regarding specifications for this measure over the past year. Questions regarding clarification of the data element Atrial Fibrillation/Flutter are most common. Abstractors are instructed to select 'YES' if there is any documentation of a history of or current finding of atrial fibrillation/flutter in the medical record. Despite this abstraction guideline, questions regarding the frequency of atrial fibrillation/flutter episodes, the duration of the episode, confirmed versus non-confirmed EKG findings, conflicting documentation, and past history of ablation procedure or permanent pacemaker for atrial fibrillation are frequent themes. In addition, many questions have been received regarding the acceptability of new anticoagulant agents, (i.e., dabigatran, rivaroxaban) for inclusion in the numerator population when prescribed at discharge. Both medications have been added to medication Table 8.3 Anticoagulant Medications-Stroke.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:

As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:

Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.

These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a length of stay (LOS) greater than 120 days
3. Patients with Comfort Measures Only documented
4. Patients enrolled in clinical trials
5. Patients admitted for Elective Carotid Intervention

6. Patients discharged to another hospital (acute care facility)
7. Patients who left against medical advice
8. Patients who expired
9. Patients discharged to home for hospice care
10. Patients discharged to a health care facility for hospice care
11. Patients with a documented Reason For Not Prescribing Anticoagulation Therapy at Discharge

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*

N=39,812

1. Patients < 18 years old = 0%
2. Patients who have a length of stay (LOS) greater than 120 days = 0%
3. Patients with Comfort Measures Only documented = 11.11%
4. Patients enrolled in clinical trials =0.39%
5. Patients admitted for Elective Carotid Intervention = 9.96%
6. Patients discharged to another hospital (acute care facility) = 1.13%
7. Patients who left against medical advice = 0.25%
8. Patients who expired = 3.58%
9. Patients discharged to home for hospice care = 0.60%
10. Patients discharged to a health care facility for hospice care = 1.52%
11. Patients with a documented Reason For Not Prescribing Anticoagulation Therapy at Discharge = 10.84%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:

Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:

Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:

Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment: Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:

This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:

The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:

STK-3 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	131	0.94408	0.16256	1	1	1	1	0.83333
2Q2011	131	0.94408	0.16256	1	1	1	1	0.83333
1Q2011	147	0.92518	0.17565	1	1	1	0.94737	0.66667
4Q2010	126	0.92909	0.19535	1	1	1	1	0.8
3Q2010	119	0.94605	0.15078	1	1	1	1	0.75
2Q2010	113	0.93581	0.16405	1	1	1	0.93333	0.81818
1Q2010	90	0.91729	0.15775	1	1	1	0.88889	0.66667
4Q2009	43	0.90522	0.22409	1	1	1	0.875	0.8

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data;*

if a sample, characteristics of the entities included):

Multiple data sources are not used for this measure.

2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*:

Not applicable

2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*:

Not applicable

2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:

Although some evidence exists that minorities are less likely to receive secondary prevention measures such as anticoagulation therapy for atrial fibrillation/flutter, there are no plans to stratify the measure. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data, might be collected reliably in the future.

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met?

(*Reliability and Validity must be rated moderate or high*) Yes☐ No☐

Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b6)

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☐ **Critical data elements** (*data element validity must address ALL critical data elements*)

☐ **Performance measure score**

☐ **Empirical validity testing**

☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospitals selection was based to those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospitals patient level data from The Joint commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for stroke as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:

STK_6	0.53082 <.0001 1318	0.47326 <.0001 1318	0.28198 <.0001 1302	0.43717 <.0001 1144	0.35302 <.0001 1318	1.00000 1318	0.45420 <.0001 1318
STK_10	0.45291 <.0001 1318	0.29578 <.0001 1318	0.15819 <.0001 1302	0.41076 <.0001 1144	0.39079 <.0001 1318	0.45420 <.0001 1318	1.00000 1318

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicates convergent validity of the measures. STK-03 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .

NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with *Comfort Measures*
- Patient enrolled in a Clinical Trial
- Patients admitted for *Elective Carotid Intervention*
- Patients with a documented *Reason For Not Prescribing Anticoagulation Therapy at Discharge*
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the

2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: *Comfort Measures Only*
Overall Occurrence n = 163,225

Overall Occurrence Percentage 10.4%

Minimum 0.30%

10th Percentile: 5.26%

Median: 10%

90th Percentile: 15.8%

Maximum: 35.7%

Exclusion: Clinical Trial

Overall Occurrence n = 5,446

Overall Occurrence Percentage: 0.25%

Minimum: 0.08%

10th Percentile: 0.24%

Median: 0.52%

90th Percentile: 1.90%

Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*

Overall Occurrence n = 259,833

Overall Occurrence Percentage: 11.8%

Minimum: 0.16%

10th Percentile: 2.28%

Median: 11.5%

90th Percentile: 25.3%

Maximum: 95.2%

Exclusion: Patients with a documented *Reason For Not Prescribing Anticoagulation Therapy at Discharge*

Overall Occurrence n = 25,249

Overall Occurrence Percentage 8.01%

Minimum: 0.25%

10th Percentile: 1.96%

Median: 5.22%

90th Percentile: 16%

Maximum 84.46%

Exclusion: *Discharge Disposition* - Patients discharged to another hospital

Overall Occurrence n = 449,924

Overall Occurrence Percentage 35.7%

Minimum: 0.787%

10th Percentile: 25%

Median: 35.4%

90th Percentile: 46%

Maximum: 76.2%

Exclusion: *Discharge Disposition* - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: *Discharge Disposition* - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: *Discharge Disposition*- Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage 52.2%
Minimum: 6.25%
10th Percentile: 39%

Median: 51.9%
90th Percentile: 64%
Maximum 94.3%

Exclusion: *Discharge Disposition* - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage 3%
Minimum: 0.169%
10th Percentile: 0.87 %
Median: 3.01%

90th Percentile: 6.4%

Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age

Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days

Rationale: Included for this measure in order to harmonize with other CMS/Joint Commission aligned measures.

Patients with *Comfort Measures Only* documented

Rationale: It is inappropriate to treat such patients beyond those measures necessary for comfort.

Patients enrolled in a Clinical Trial

Rationale: Anticoagulation therapy as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require anticoagulation therapy

Patients with a documented *Reason For Not Prescribing Anticoagulation Therapy at Discharge*

Rationale: It is inappropriate to treat patients who have a documented reason or contraindication to anticoagulation therapy

Patients discharged to another hospital

Rationale: This measure is meant for patients discharged to home.

Patients who left against medical advice

Rationale: Hospitals do not have opportunity for provision of quality care for the non-compliant patient.

Patients who expired

Rationale: Patients who expire are not eligible to be in this measure

Patients discharged to home for hospice care

Rationale: Anticoagulation therapy may not be warranted for the hospice patient

Patients discharged to a healthcare facility for hospice care

Rationale: Anticoagulation therapy may not be warranted for the hospice patient.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields. All data elements needed to compute the STK-3 performance measure score have been retooled for capture from electronic sources. Annual updates are performed to match the eCQM specifications to the current version of the chart-abstracted specifications.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use The Joint Commission performance measures, all of which are in the public

domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting http://www.qualitycheck.org/consumer/searchQCR.aspx Quality Check® Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke Centers Disease-Specific Care Certification for Primary Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

- Name of program and sponsor: Quality Check®; The Joint Commission
- Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint

Commission-accredited hospitals (2014)

- Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
- Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ Medicare-certified hospitals (2015)

- Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
- Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
- Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

- Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
- Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

- Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
- Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

- Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
- Purpose: A certification program that recognizes that specific capabilities of hospitals that treat the most complex stroke cases.
- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

- Name of program and sponsor Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
- Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

- Name of program and sponsor Hospital Accreditation Program; The Joint Commission
- Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
- Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not Applicable

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)

Not Applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

The rate of anticoagulation therapy for atrial fibrillation has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 97.2%. A gap of ~12% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate of anticoagulation for atrial fibrillation published by GWTG-Stroke and PCNASR. Non-Hispanic black patients continue to be an underserve population (Schwamm, 2010, Qian, 3013; CDC 2014). Women are also less likely to receive anticoagulation therapy for atrial fibrillation (Bushnell, et al, 2014).

- Geographic area and number and percentage of accountable entities and patients included: Nationwide; 1256 hospitals; 28,027 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not Applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Novel oral anticoagulant drugs (NOACs) have been added to the list of comprehensive anticoagulant medications for stroke (Appendix C, Table 8,3) as they have become approved by the United States Food and Drug Administration (FDA). Although some adverse events have been associated with the NOACs and reported in the literature, e.g., increased incidence of myocardial infarction with dabigatran, no unintended negative consequences have been reported with the addition of the warfarin-alternative agents as a result of ongoing data collection.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation
0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge
0624 : Atrial Fibrillation - Anticoagulation Therapy
1525 : Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0624 : Atrial Fibrillation - Anticoagulation Therapy; Active Health Management – no longer NQF-endorsed.
0084 : Heart Failure (HF) : Warfarin Therapy Patients with Atrial Fibrillation –status unspecified; AMAPCPI
0241 : Stroke and Stroke Rehabilitation: Anticoagulant Therapy Prescribed for Atrial Fibrillation (AF) at Discharge- status unspecified; AAN

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measure 1525 from the American College of Cardiology is a physician performance measure identified through CPT codes and could extend to the outpatient setting. The measure evaluates physician practice as opposed to hospital processes. The target population for measure 1525 differs from measure 0436 Anticoagulation Therapy for Atrial Fibrillation/Flutter in that it includes in the denominator population all patients age 18 years and older with a diagnosis of nonvalvular atrial fibrillation or atrial flutter whose assessment of the specified thromboembolic risk factors indicate one or more high-risk factors or more than one moderate risk factor, as determined by CHADS2 risk stratification. It is not specified for ischemic stroke patients with atrial fibrillation/flutter only.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Brief Measure Information

NQF #: 0437
Measure Title: STK 04: Thrombolytic Therapy
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of acute ischemic stroke patients who arrive at this hospital within 2 hours of time last known well for whom IV t-PA was initiated at this hospital within 3 hours of time last known well. This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs. This measure captures the proportion of acute ischemic stroke patients who arrive at this hospital within 2 hours of time last known well for whom IV t-PA was initiated at this hospital within 3 hours of time last known well.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.

Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Studies have demonstrated that the early administration of thrombolytic therapy within 3 hours of stroke symptom onset can significantly improve neurologic outcomes at 3 months in patients with ischemic stroke. The European Cooperative Acute Stroke Study (ECASS) III trial indicated that intravenous rtPA can be given safely to, and can improve outcomes for, carefully selected patients treated 3 to 4.5 hours after stroke; however, as the NINDS investigators concluded, the earlier that IV thrombolytic therapy is initiated, the better the patient outcome. Despite strong recommendations from the American Academy of Neurology, the American Heart Association, and the American College of Chest Surgeons, thrombolytic therapy is used in only a small proportion of ischemic stroke patients overall and in only a minority of eligible candidates.

Healthcare organizations that track IV thrombolytic administration for internal quality improvement purposes have seen a significant increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Acute ischemic stroke patients for whom IV thrombolytic therapy was initiated at this hospital within 3 hours (less than or equal to 180 minutes) of time last known well.
Denominator Statement: Acute ischemic stroke patients whose time of arrival is within 2 hours (less than or equal to 120 minutes) of time last known well.
Denominator Exclusions:
- Less than 18 years of age
- Length of Stay > 120 days
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Time last known well to arrival in the emergency department greater than 2 hours

• Documented reason for extending the initiation of IV thrombolytic
• Documented reason for not initiating IV thrombolytic

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence
Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012:

- The body of evidence consistently supports that thrombolytic therapy results in a significant net reduction in the proportions of patients dead or dependent in activities of daily living due to ischemic stroke. Based on these findings, clinicians may choose to use thrombolytic therapy in selected patients within three hours of symptom onset.
- Class I, Level of Evidence A – 2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke, page 1676
    - Intravenous rtPA (0.9mg/kg, maximum dose 90 mg) is recommended for selected patients who may be treated within 3 hours of onset of ischemic stroke. Physicians should review the criteria outlined in Table 11 (which are modeled on those used in the NINDS trial) to determine the eligibility of the patient. A recommended regimen for observation and treatment of the patient is described in Table 12. This recommendation has not changed from previous statements.
- The 2012 Committee agreed that this measure was supported by strong evidence.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**
☐ **The developer provided updated evidence for this measure:**

Guidance from the Evidence Algorithm:
Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and*

there is no need for repeat discussion and voting on Evidence?

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	129	136	136	224	1,099
# cases (den)	1,728	1,942	1,807	3,135	14,907
National aggregate rate	0.61	0.69	0.77	0.80	0.85
Mean hospital rate	0.57	0.57	0.67	0.75	0.75
50th percentile	0.67	0.72	0.77	0.88	0.89
10th and 90th percentiles	0.00 (10th) 1.00 (90th)	0.00 (10th) 1.00 (90th)	0.00 (10th) 1.00 (90th)	0.00 (10th) 1.00 (90th)	0.00 (10th) 1.00 (90th)

Disparities:

- The developer does not provide disparities data from use of this measure.
- The developer states that since the last submission, several large studies evaluating thrombolysis utilization have shown that while disparities still exist for many groups, the disparity gap has narrowed for certain groups, e.g., older adults, young adults, women, and young blacks.

Questions for the Committee:

- *Is there a gap in care that warrants a national performance measure?*
- *Is there evidence that a gap in care still exits for minority populations? How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **No new studies/information

**High. Has not changed since we last reviewed this measure.

**High

1b. Performance Gap

Comments: **No disparities data provided

**Moderate. Some performance data is provided to show that the performance gap is reducing, but a sufficiently meaningful gap remains to justify the measure. The measurement does not appear to be topped out. Disparities data is more limited, in the form of several large studies which show some improvements in patient subgroups, but it is not clear from the measure how subgroup data is being captured to determine if disparities are being addressed.

**moderate – improving, disparities gap narrowing

1c. High Priority (previously referred to as High Impact)

Comments: **No comments provided

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- Five data elements define the numerator and 14 data elements define the denominator.
- Developer reports the following revisions since last endorsement date:
  - A paragraph was added to the measure rationale referencing the European Cooperative Acute Stroke Study (ECASS) III trial and the safe administration of IV thrombolytic therapy within the extended timeframe of 3 to 4.5 hours after stroke for select patients, as well as, the importance of maintaining the administration target of 3 hours.
  - A new data element, Reason for Extending the Initiation of IV Thrombolytic, was added and the measure algorithm adjusted to exclude patients who receive IV thrombolytic therapy within 3 to 4.5 hours after the time last known well when a patient or medical reason is documented in the medical record. Notes for abstraction previously used to exclude these patients were removed from the data element IV Thrombolytic Initiation.
  - Abstraction guidelines for several data elements were also modified to address questions received from data abstractors. The timeframe for documentation of a Reason for Not Initiating IV Thrombolytic was specified as the day of or day after hospital arrival to prevent late entries and addendums after discharge. The same timeframe was specified for the new data element Reason for Extending the Initiation of IV Thrombolytic. Stand-alone reasons were specified for both reason data elements, and a new abstraction bullet added that system reasons are not acceptable.
  - For the data elements Date Last Known Well, Last Known Well, and Time Last Known Well, abstraction guidelines were clarified to address questions about multiple times or conflicting time documentation in the medical record. A sample of vendors and their hospital customers were surveyed to obtain feedback on these changes prior to implementation.
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke).
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
  - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.
- The measures is specified at the hospital level of analysis.

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

For maintenance measures, summarize the reliability testing from the prior review:

- Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 98.1%.
  - Five data elements found >90% agreement: Clinical Trial (99.7%), ED Patient (99.7%), Elective Carotid Intervention (99.6%), IV Thrombolytic Initiation (90.7%), and IV Thrombolytic Initiation Date (92.6%).
  - Four data elements found >80% agreement: Date Last Known Well (87.9%), IV Thrombolytic Initiation Time (85.2%), Last Well Known (87.2%), and Time Last Known Well (80.0%).
  - One data element found <80% agreement: Reason for Not Initiating IV Thrombolytic Therapy (76.7%).
  - No Kappa scores were presented.

- In 2012, the Committee requested further information from the developers on why patients with a length of stay over 120 days are excluded from the measure. The developer explained that this exclusion is an artifact of the billing cycles used by CMS, and that in practice, it has a negligible impact on the measure.

Describe any updates to testing: No new information provided

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing: see above

Results of reliability testing: see above

Guidance from the Reliability Algorithm:

Precise specifications (Box 1) →empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9)→ high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the

evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Specification not completely consistent with evidence

Question for the Committee:

o *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

For maintenance measures, summarize the validity testing from the prior review:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users that is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions regarding clarification of the data elements Last Known Well, Date Last Known Well, and Time Last Known Well were most common.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**

☒ **Empirical validity testing of the measure score**

Validity testing method:

- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- o *Is the test sample adequate to generalize for widespread implementation?*
- o *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- o *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Time Last Known Well to arrival in the emergency department greater than 2 hours
- Patients with a documented Reason For Extending the Initiation of IV Thrombolytic
- Patients with a documented Reason For Not Initiating IV Thrombolytic

- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Clinical Trial: 0.25% (range 0.24-10.0%)
  - Elective Carotid Intervention: 11.8% (range 0.16-95.2%)
  - Time Last Known Well: None
  - Reason For Not Initiating IV Thrombolytic: 24.0% (range 0.42-92.0%)
  - Reason For Not Initiating IV Thrombolytic: 0.70% (range 0.09-35.2%)

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →high confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **Consistent

**The specification is consistent with the evidence.

**sufficient validity

2a2. Reliability Testing

Comments: **Sufficient validity testing

**New data demonstrating a highly significant positive correlation between this measure and 6 other stroke performance measures. This is in addition to the previous validity data provided in the last review. The validity data in the last endorsement was deemed valid and remains so. This new data demonstrates a correlation among the various stroke measures, suggesting that increasing quality on this measure is associated with similar levels of quality on other measures on a per hospital basis. If there is sufficient data to support the validity of the other stroke measures as a quality measure, then this new data does support the validity of this measure. However, without independent data on the validity of those other measures, it is not clear how the positive correlation alone further supports the validity of this measure.

**yes, data strongly supports

2b2. Validity Testing

Comments: **No

**Overall the exclusions are consistent with the evidence. However, it is not clear if simple documentation of a reason for extending or not initiating IV thrombolytics is sufficient. For example, would documentation of an unjustified reason be acceptable here? There does not appear to be a criteria that the documented reason be supported by evidence. For example, if there was a delay in IV thrombolysis to the 3-4.5 hour window for a reason that is not supported by the ECASS study, but this was documented, would that be sufficient to exclude from the denominator?

**no

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **New reliability testing not needed

**The developer has not provided new reliability data since the last review. There is no compelling reason for repeat discussion and vote, although it seems possible that one element that was below 80%, Reason for not initiating IV thrombolysis, could be affected by or confounded by the new data element derived from the ECASS study regarding the 3-4.5 hour window.

**yes, widely accepted

Criterion 3. Feasibility

Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available.
- Some data elements are in electronic form.
- Data collection burden is significant.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Some data elements in EHR

**Most of the data elements are routinely generated. The are not available in electronic form in institutions without an EHR so a paper option is provided in this measure.

**High fasibility, with caveat of limitations for institutions without HER. However, this is generally an ER or ICU procedure and there

is high likelihood of electronic data capture in these settigns for all institutions.

Criterion 4: Usability and Use
Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure
Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details:

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CMS Hospital Compare: Public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:

- The developer provided the following progress information on 1,099 hospitals nationwide and 14,907 patients:
    - The rate of intravenous thrombolytic (t-PA) administration has improved by 57.8% over the past five years based on Joint Commission ORYX performance measurement data. This trend is consistent with increases in the rate of IV t-PA administration reported in multiple published studies.
    - Other trends identified in the literature include: an increasing interest in the concept of treating patients with milder symptoms or rapid improvement; an increased proportion of very old (> 85 years) acute ischemic stroke patients receiving tPA; an increased proportion of young acute ischemic stroke patients (mean age 37 years), in particular young blacks, receiving tPA; and, a slight increase in the proportion of women receiving tPA. Additionally, an increased trend in the rate of tPA utilization for urban patients treated at urban hospitals, as well as, rural patients treated at rural hospitals has been reported.

Unexpected findings (positive or negative) during implementation: The developer did not identify any unexpected findings during implementation.

Potential harms:

- The updated guideline recommendation for IV t-PA administration within 3 to 4.5 hours after stroke generated concern that thrombolytic therapy initiation would be delayed for patients eligible to receive treatment within 3 hours and result in poorer outcomes for stroke patients. Since earlier initiation is associated with better neurological outcomes, the STK-4 numerator has remained unchanged; however, the measure specifications have been modified to clearly exclude patients who are treated with IV t-PA within 3 to 4.5 hours and have a documented medical or patient reason for the delay in initiation.

Feedback :

- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency
4b. Improvement
4c. Unintended Consequences
Comments: **High usability
**The benefits clearly outweigh any potential unintended consequences. However, it is not entirely clear if simple exclusion of patients with a documented medical or patient reason for receiving delayed tPA (3-4.5 hours) is adequate. A documented reason could be inappropriate, due to physician ignorance of current data, but it would still be documented.
**High usability. No anticipated unintended consequences from measurement.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0164 : Fibrinolytic Therapy received within 30 minutes of hospital arrival
- 0288 : Fibrinolytic Therapy Received Within 30 Minutes of ED Arrival
- 1952 : Time to Intravenous Thrombolytic Therapy

- 0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered – AMA-PCPI – no longer NQF endorsed

Harmonization:

- Measures 0288 and 0164 are AMI (Acute Myocardial Infarction) measures and are harmonized to the extent that the measures utilize some of the same data elements.
- The target population for measure 1952 from the American Heart Association/American Stroke Association also includes patients hospitalized for acute ischemic stroke; however, the measure captures average door-to-needle time and uses a target of less than 60 minutes rather than the proportion of patients who arrive within 2 hours

and receive t-PA within 3 hours of time last known well.

- Measure 0242 is a physician level measure with a targeted population of ischemic stroke patients identified through CPT codes and could extend to the outpatient setting.

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0437	NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT
Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence. *Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.* (evaluation criteria)
1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*: The focus of the measure is to improve neurological outcomes for ischemic stroke patients through the timely initiation of intravenous (IV) thrombolytic therapy (t-PA) to carefully screened, eligible candidates. IV thrombolytic therapy initiated >> improved neurological outcomes >> decreased morbidity and mortality. 1c.2-3 Type of Evidence *(Check all that apply)*: Clinical Practice Guideline Selected individual studies (rather than entire body of evidence) Systematic review of body of evidence (other than within guideline development) 1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*: This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the early management of adults with ischemic stroke. The administration of thrombolytic agents to carefully screened, eligible patients with acute ischemic stroke has been shown to be beneficial in several clinical trials. These included two positive randomized controlled trials in the United States: The National Institute of Neurological Disorders and Stroke (NINDS) Studies, Part I and Part II. Based on the results of these studies, the Food and Drug Administration approved the use of intravenous recombinant tissue plasminogen activator (IV r-TPA or t-PA) for the treatment of acute ischemic stroke when given within 3 hours of stroke symptom onset. A large meta-analysis controlling for factors associated with stroke outcome confirmed the benefit of IV t-PA in patients treated within 3 hours of symptom onset. While controversy still exists among some specialists, the major society practice guidelines developed in the United States all recommend the use of IV t-PA for eligible patients. Physicians with experience and skill in stroke management and the interpretation of CT scans should supervise treatment. 1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: Relevant literature supporting thrombolysis for acute ischemic stroke was identified through a Cochrane review, prepared and maintained by The Cochrane Collaboration and published in The Cochrane Library 2009, Issue 4. The search strategy employed the Cochrane Stroke Group Trials Register (last

searched October 2008), MEDLINE (1966 to October 2008) and EMBASE (1980 to October 2008). Selection criteria involved randomized trials of any thrombolytic agent compared with control in patients with definite ischemic stroke (i.e., computerized tomography (CT) or magnetic resonance imaging (MRI) having excluded intracranial hemorrhage prior to randomization).

The review included 26 trials involving 7152 patients. This review included all new trials completed and made public since 2003, as well as additional data published since 2003 from trials included in earlier versions of the review. The total number of patients included in the review represented a 10-fold increase in the number of study patients since the first review in 1990. Very few of the patients (0.5%) were aged over 80 years.

The primary outcomes measured were death or dependency, as defined by modified Rankin score of 3 to 6, and death at the end of follow-up. Not all trials contributed data to each outcome. The trials tested urokinase, streptokinase, recombinant tissue plasminogen activator, recombinant pro-urokinase or desmoteplase, Four trials used intra-arterial administration, the rest used the intravenous route. Most data came from trials that started treatment up to six hours after stroke; three trials started treatment up to nine hours and one small trial up to 24 hours after stroke. About 55% of data (patients and trials) came from trials testing intravenous tissue plasminogen activator.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting thrombolysis for acute ischemic stroke is high. The Cochrane Review noted above confirmed that thrombolytic treatment can reduce the risk of disability post-ischemic stroke, despite the bleeding risks. This review was conducted by two review authors who applied the selection criteria and extracted data. The reviewers assessed trial quality and verified the extracted data with the principal investigators of all major trials for both published and unpublished data. Specifically, the reviewers hand-searched journals from 1979 to April 1994; contacted 321 pharmaceutical companies for more information about trials known to exist and unknown based on prior searches; examined references quoted in thrombolytic therapy papers; contacted principal investigators of trials in Europe, North American, Japan, China , and Australia; and, attended multiple international conferences on stroke and thrombolysis since 1991). Every effort was made to identify truly randomized trials of thrombolytic therapy compared with placebo or open control in patients with acute ischemic stroke. Trials that were not truly random, such as dose-range-finding studies, were excluded.

According to the Cochrane reviewers, many trials had some imbalance in key prognostic variables. Several trials did not have complete blinding of outcome assessment. Thrombolytic therapy administered up to six hours after ischemic stroke significantly reduced the proportion of patients who were dead or dependent (modified Rankin 3 to 6) at three to six months after stroke (odds ratio (OR) 0.81, 95% Confidence Interval (CI) 0.73 to 0.90). Thrombolytic therapy increased the risk of symptomatic hemorrhage (OR 3.49, 95% CI 2.81 to 4.33) and death within three to six months after stroke (OR 1.31, 95% CI 1.14 to 1.50). Treatment within three hours of stroke appeared more effective in reducing death or dependency (OR 0.71, 95% CI 0.52 to 0.96) with no statistically significant adverse effect on death (OR 1.13, 95% CI 0.86 to 1.48). There was heterogeneity among the trials in part attributable to concomitant antithrombotic drug use (P =0.02), stroke severity and time to treatment. Antithrombotic drugs given soon after thrombolysis may increase the risk of death.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that thrombolytic therapy results in a significant net reduction in the proportions of patients dead or dependent in activities of daily living due to ischemic stroke. Based on these findings, clinicians may choose to use thrombolytic therapy in selected patients within three hours of symptom onset.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence on the immediate hazards and net benefits of thrombolytic therapy in the treatment of acute ischemic stroke. Thrombolytic therapy administered up to six hours after ischemic stroke significantly reduced the proportion of patients who were dead or dependent (modified Rankin 3 to 6) at three to six months after stroke (odds ratio (OR) 0.81, 95% Confidence Interval (CI) 0.73 to 0.90). Treatment within three hours of stroke appeared more effective in reducing death or dependency (OR 0.71, 95% CI 0.52 to 0.96) with no statistically significant adverse effect or death (OR 1.13, 95% CI 0.86 to 1.48).

Treating ischemic stroke patients with IV t-PA within 3 hours of time last known well improves functional outcomes at 3 months. Considering the mean lifetime cost of ischemic stroke, estimated at $140,048 per person, thrombolytic therapy is also cost-effective.

Fagan et al. (1998) used data from the NINDS rt-PA Stroke Trial and developed a Markov model to compare costs per 1,000 eligible t-PA patients with the costs per 1,000 untreated patients. This analysis revealed a greater than 90% probability of costs savings when eligible patients are treated with t-PA within 3 hours. In the NINDS rt-PA Stroke Trial, the average length of stay was significantly shorter for patients treated with t-PA than the placebo group (10.9 versus 12.4 days; p=0.002), and more patients were discharged to home than to an inpatient rehabilitation facility or a nursing home (48% versus 36%; p=0.002). The Markov model estimated an increase in hospitalization costs of $1.7 million and a decrease in rehabilitation costs of $1.4 million and nursing home cost of $4.8 million per 1,0000 eligible t-PA patients. Furthermore, the analysis estimated the long-term impact on health outcomes to be 564 quality-adjusted life-years saved over 30 years per 1,000 patients.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of IV thrombolytic therapy within 3 hours of stroke symptom onset is undisputed. No position against the administration of thrombolytic therapy to select, eligible ischemic stroke patients was noted in the literature. However, there is still not enough evidence to answer some questions. More randomized trials are needed to determine the full impact of benefit, the latest time window for safe administration, the cut-off age for treatment, the type of stroke and grades of severity most likely to respond favorably to treatment, and the impact of various co-morbidities and concomitant drug therapies on outcome.

1c.16 Quote verbatim, the specific guideline recommendation *(Including guideline # and/or page #)*:
2007 AHA/ASA Guidelines for the Early Management of Adults with Ischemic Stroke, page 1676.

Class I, Level of Evidence A
Intravenous rtPA (0.9mg/kg, maximum dose 90 mg) is recommended for selected patients who may be treated within 3 hours of onset of ischemic stroke. Physicians should review the criteria outlined in Table 11 (which are modeled on those used in the NINDS trial) to determine the eligibility of the patient. A recommended regimen for observation and treatment of the patient is described in Table 12. This recommendation has not changed from previous statements.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0437_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Studies have demonstrated that the early administration of thrombolytic therapy within 3 hours of stroke symptom onset can significantly improve neurologic outcomes at 3 months in patients with ischemic stroke. The European Cooperative Acute Stroke Study (ECASS) III trial indicated that intravenous rtPA can be given safely to, and can improve outcomes for, carefully selected patients treated 3 to 4.5 hours after stroke; however, as the NINDS investigators concluded, the earlier that IV thrombolytic therapy is initiated, the better the patient outcome. Despite strong recommendations from the American Academy of Neurology, the American Heart Association, and the American College of Chest Surgeons, thrombolytic therapy is used in only a small proportion of ischemic stroke patients overall and in only a minority of eligible candidates.

Healthcare organizations that track IV thrombolytic administration for internal quality improvement purposes have seen a significant increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Many patients with acute ischemic stroke arrive at the hospital within three hours of stroke onset without documented contraindications who still do not receive intravenous (IV) thrombolysis (t-PA). Although rates of IV t-PA administration have improved over time, there is still less than optimal performance especially in the lower quartile and decile of hospitals. In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Joint Commission ORYX performance measure data for 4Q 2009 yielded an average measure rate of 48.9% from 39 hospitals collecting data for this measure (n=233 patients). The average rate for all hospitals collecting data for this measure (i.e., 1099 hospitals; n=14,907 patients) is currently 84.5%, indicating that a potential performance gap of 15% persists if the optimal rate is 100%. Below is the specified level of analysis for STK-4 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 233 denominator cases; 114 numerator cases; 39 hospitals; 0.48927 national aggregate rate; 0.54417 mean of hospital rates; 0.41298 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.625 50th percentile rate/median rate; 0.03704 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2010: 1728 denominator cases; 1053 numerator cases; 129 hospitals; 0.60938 national aggregate rate; 0.56977 mean of hospital rates; 0.37503 standard deviation; 1.0 90th percentile rate; 0.9 75th percentile rate/upper quartile; 0.66667 50th percentile rate/median rate; 0.21212 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2011: 1942 denominator cases; 1333 numerator cases; 136 hospitals; 0.68641 national aggregate rate; 0.57338 mean of hospital rates; 0.37267 standard deviation; 1.0 90th percentile rate; 0.89737 75th percentile rate/upper quartile; 0.71964 50th percentile rate/median rate; 0.23611 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2012: 1807 denominator cases; 1393 numerator cases; 136 hospitals; 0.77089 national aggregate rate; 0.67283 mean of hospital rates; 0.34402 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.7735 50th percentile rate/median rate; 0.5 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2013: 3135 denominator cases; 2493 numerator cases; 224 hospitals; 0.79522 national aggregate rate; 0.74944 mean of hospital rates; 0.3186 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.875 50th percentile rate/median rate; 0.66667 25th percentile rate/lower quartile; and, zero 10th percentile rate.

CY 2014: 14,907 denominator cases; 12,598 numerator cases; 1099 hospitals; 0.84511 national aggregate rate; 0.75482 mean of hospital rates; 0.32814 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.88889 50th percentile rate/median rate; 0.66667 25th percentile rate/lower quartile; and, zero 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not applicable.

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable.

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
Since the last endorsement period, several large studies have evaluated trends in thrombolysis utilization across the United States. While disparities still exist for many groups, the disparity gap has narrowed for certain groups, e.g., older adults, young adults, women, and young blacks, since the last submission.

George and colleagues (2015) analyzed discharge data from 2005 to 2010 in the Nationwide Inpatient Sample (NIS) of the Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (Rockville, MD). This analysis identified persistent racial disparities for blacks and Hispanics consistent with those found previously for blacks and Hispanics (Kimball, et al. 2012), as well as, a trend to treat older adults who would not have been considered t-PA candidates in earlier years and increased utilization rates for rural patients. From this database, 512,429 older adults (> 65 years of age) with acute ischemic stroke who received an injection or infusion of a thrombolytic agent were identified and divided into three age groupings (65-74, 75-84, > 85 years). Among U.S. hospitals with acute stroke patients, there were an estimated 1462 hospitals (32%) administering thrombolysis in 2005 and 1884 hospitals (43%) in 2010 (trend P = 0.003). For older adult stroke admissions, the rate of thrombolysis increased from 1.7% (95% CI: 1.6-1.8%) in 2005 to 5.4% (95% CI: 5.2-5.6%) in 2010, representing a three-fold increase in thrombolysis rates for older adults (trend P < 0.001). The largest increases occurred for individuals > 85 years of age with an approximate four-fold rate increase from 2005 to 2010. Rates of administration increased three-fold for urban patients and urban hospitals. Thrombolysis rates also increased for rural patients (0.9% in 2005 vs. 3.3% in 2010; trend P < 0.001), and rural hospitals increased at a slower rate (0.5% in 2005 vs. 1.7% in 2010; (trend P < 0.001). Low volume hospitals increased their rates of thrombolysis in older adults to a lesser degree than higher volume centers.

A second study using discharge data obtained from the Nationwide Inpatient Sample between 2001 and 2009 reported that disparities for young blacks has significantly improved in recent years (Kansara, et al. 2013). Between 2001 and 2009, there were an estimated 4,917, 217 admissions for acute ischemic stroke. Of these, 204,703 (4.16%) were young patients with a mean age approximately 37 years. The use of thrombolysis for young acute ischemic stroke patients increased 270% during this time period. The increased rate was noted across all races, including white, black, and nonwhite/nonblack populations. Unlike previous studies that reported that black patients were less likely to receive thrombolysis, this study found that a greater percentage of young black patients with acute ischemic stroke (5.45%) received thrombolysis than young white patients with acute ischemic stroke (4.57%) in 2009.

A univariate analysis of more than one million (N=1,093,895) acute ischemic stroke patients from 1683 hospitals participating in the American Heart Association's Get With the Guidelines-Stroke database was conducted to evaluate changes in the patterns of IV t-PA use over the 9-year period from April 2003 to December 2011. IV thrombolytic use has changed over time with a broader range of patients treated in later years. According to this analysis, the proportion of patients age > 85 years treated with IV t-PA increased

from 10.5% in 2003-2005 to 16.4% in 2010-2011 (P<0.001). Also, the gender distribution of t-PA use changed slightly, with the proportion of t-PA use among women increasing from 48.6% to 51%. The population receiving t-PA also became more diverse, with nonwhites accounting for 21.1% of t-PA use in 2003 to 2005 but 28.9% in 2010 to 2011(P<0.001) (Schwamm, et al. 2013). This study is among the first to describe the temporal trends of the past decade in IV t-PA use in patients with acute ischemic stroke in a clinically derived dataset from a sizeable cohort of U.S. hospitals nationwide.

Another published study utilized the American Heart Association's Get With the Guidelines-Stroke registry linked with Medicare claims data set to examine whether 30-day and 1-year outcomes differed by race/ethnicity among older patients with acute ischemic stroke (Qian, et al., 2013). Compared with other race/ethnicity groups, non-Hispanic black patients were less likely to receive IV t-PA in less than 3 hours from stroke onset. Relative to whites, black and Hispanic patients had higher adjusted 1-year all-cause rehospitalization (black: adjusted odds ratio, 1.28 [95% CI, 1.21-1.37]; Hispanics: adjusted odds ratio 1.22 [95% CI, 1.11-1.35]. Non-Hispanic black patients were more likely to be treated at high-volume and academic hospitals, which were generally located in the south. These findings were based on an analysis of 200,900 patients, including 20514 non-Hispanic blacks (10.2%), with acute ischemic stroke greater than 65 years of age from 926 U.S. centers participating in the GWTG-Stroke program from April 2003 through December 2008.

A prior 2011 report from the American Heart Association/American Stroke Association reported that racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

As stated in the previous submission citing earlier studies, the burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined

significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence
rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010). In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Minorities are less likely to use emergency medical services and more likely to wait longer before going to the hospital than are non-Hispanic whites. After hospital arrival, blacks or African Americans and possibly Hispanics experience longer wait times in the emergency department which results in treatment delays that include administration of thrombolytic therapy. Although unmeasured factors may play a role in these delays, the presence of bias in the delivery of care cannot be excluded (Cruz-Flores, et al, 2011).

The Department of Neurology and Stroke Program, Wayne State University School of Medicine, Detroit, MI (Bhattacharya P, et al., 2011) explored racial differences in the delivery of care to patients with acute stroke between hospitals certified in primary stroke care by The Joint Commission and noncertified hospitals. A retrospective chart review of 574 patients (25.1% African American) with ischemic stroke admitted to five Joint Commission certified primary stroke centers and five non-certified hospitals was conducted. Similar to previous studies, Bhattacharya found that African Americans often did not receive intravenous tPA because of a delay in hospital arrival. Whites were more likely to arrive by emergency transport services (65.5% vs 51.1%; P= 0.004) to be evaluated by a stroke team (19.1% vs. 7.7%; P=0.001), and to have documented National Institutes of Health Stroke Scale (NIHSS) score (40.2% vs. 29/9%; P=0.03); however, the number of white and black patients who received IV t-PA was not statistically different (2.1% in African Americans, 3.5% in Caucasians; P=0.40).

A larger study of 1044 patients (74% African American, 19% non-Hispanic white) with ischemic stroke (Hsia AW, et al., 2011), found that blacks were one-third less likely than whites to receive IV t-PA (3% vs.10%, P<0.001). Blacks were less likely than whites to present in 3 hours of symptom onset (13% vs. 21%; P=0.004). They were also less likely to be eligible candidates for thrombolytic therapy (5% vs. 13%; P<0.001). Of those patients who presented in 3 hours, blacks were almost half as likely to be treated with IV t-PA when compared to whites (27% vs. 46%; P=0.023).

A recent study from the Mayo Clinic, Rochester, MN (Naser DM, et al., 2011) investigated possible racial and ethnic disparities in the administration and outcome of recombinant tissue plasminogen activator (rt-PA) therapy for acute ischemic stroke in whites, blacks, Hispanics, and Asian/Pacific Islanders. Patients with a primary diagnosis of acute ischemic stroke who received rt-PA were identified using data from the National Inpatient Sample for 2001-2008 and stratified by race. The investigators analyzed the association of patient race on rt-PA utilization rate, in-hospital morbidity (i.e., discharges to a long-term care facility), intracranial hemorrhage (ICH) rate, and in-hospital mortality. Multivariate logistic regression analysis was performed to identify independent predictors of poor outcomes. Naser and colleagues concluded that whites had a higher rate of t-PA utilization than black and Hispanic patients (2.3% vs. 2.2% P= 0.07), although not statistically significant. Multivariate analysis of morbidity, mortality and ICH rates found that Asian/Pacific Islanders had significantly higher rates of mortality (odds ratio, 1.22, 95% CI, 1.91-2.11; P < .0001) compared with whites. Thrombolytic utilization was greater in white and Asian/Pacific Islander patients than in black and Hispanic patients. Asian/Pacific Islander race was associated with increased risk of ICH and mortality and rt-PA administration.

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women account for almost 60% of US stroke deaths. (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$)(US Burden of Disease Collaborators, 2013). Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Thrombolytic therapy is one of the most promising treatments for acute ischemic stroke. The majority of strokes are due to blockage of an artery in the brain by a blood clot. Prompt treatment with clot dissolving (thrombolytic) drugs can restore blood flow before major brain damage has occurred. In the United States, Canada, and most European countries, alteplase/recombinant tissue plasminogen activator (rt-PA) has been approved for use within three hours of stroke symptom onset. Successful treatment is likely to improve neurological outcomes for ischemic stroke patients at three months and later; however, intracranial hemorrhage is a serious complication of therapy and may be fatal (Jauch EC, et al., 2013).

Clinical practice guidelines for intravenous thrombolysis with rt-PA (Adam HP, et al., 2007) cite the National Institute of Neurological Disorders and Stroke (NINDS) rt-PA Stroke Study (1995), which partially supported the approval of rt-PA by the U.S. Food and Drug Administration (FDA). The NINDS trial was conducted in two consecutive parts. Part A trials in the 1980s studied very low doses of thrombolytic therapy, given daily by intravenous route for several days. The onset of treatment occurred anytime from 5 to 14 days post symptom onset. Part A trials did not collect data on functional outcome. Part B trials from the 1990s and later used a single large dose of thrombolytic drug (80 to 100 mg rt-PA), given intravenously (IV) or intra-arterially (IA) within three, six, nine, or 24 hours of stroke. The primary end point in Part B of the study was a favorable outcome, defined as complete or nearly complete neurological recovery 3 months after stroke. Favorable outcomes were achieved in 31% to 50% of patients treated with rt-PA, as compared to 20% to 38% of patients given placebo (Kwiatkowski TJ, et al., 1999). The benefit was similar one year after stoke. The major risk of treatment was symptomatic intracranial hemorrhage which occurred in 6.4% of patients treated with rt-PA and 0.6% of patients given placebo (Marler JR, et al., 2007).

In 2008, European Cooperative Acute Stoke Study (ECASS)-3, a multi-center, prospective, randomized, placebo-controlled trial, studied the administration of rt-PA between three and 4.5 hours of stroke symptom onset (Hacke W, et al., 2008). The trial enrolled 418 patients treated with rt-PA per the current dosing guidelines (i.e., 0.9 mg/kg (maximum of 90 mg) with 10% given as an initial IV bolus and the remainder infused over one hour) and compared them with 403 who were given placebo. The frequency of the primary efficacy outcome (i.e., modified Rankin Scale score of 0 to 1 at 90 days after treatment) was significantly greater with rt-PA (52.4%) than with placebo (45.2%; OR 1.34, 95% CI 1.02 to 1.76; risk ratio 1.16, 95% CI 1.01 to 1.34; P= 0.04). The point estimate for the degree of benefit seen in ECASS-3 (OR for global favorable outcome, 1.28, 95% CI 1.00 to 1.65) was less than the point estimate of benefit found in the pool of patients enrolled for 0 to 3 hours after stroke symptom onset in the NINDS study (OR 1.9, 95% CI 1.2 to 2.9).

Currently, researchers, along with the field, continue to debate the risk of intracerebral hemorrhage with IV rt-PA in certain patient populations; however, the benefit of improved functional outcomes, and potential improvements in quality of life outweighs the decision to with hold treatment of the ischemia (Saposnick, 2012).

Although the expanded timeframe of 3 to 4.5 hours for thrombolytic therapy was found to be effective for ischemic stroke patients and without significant increase in hemorrhagic events, a treatment target of 3 hours remains the accepted recommendation as studies have shown the potential opportunity for improved outcomes is greater with earlier treatment. Delays in evaluation and initiation of therapy for eligible patients with acute ischemic stroke should be avoided.

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Care Coordination, Health and Functional Status : Functional Status, Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
http://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1-635876964272987900.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
STK 04: Thrombolytic Therapy has been revised since the last endorsement date. A paragraph was added to the measure rationale referencing the European Cooperative Acute Stroke Study (ECASS) III trial and the safe administration of IV thrombolytic therapy within the extended timeframe of 3 to 4.5 hours after stroke for select patients, as well as, the importance of maintaining the administration target of 3 hours. A new data element, Reason for Extending the Initiation of IV Thrombolytic, was added and the measure algorithm adjusted to exclude patients who receive IV thrombolytic therapy within 3 to 4.5 hours after the time last known well when a patient or medical reason is documented in the medical record. Notes for abstraction previously used to exclude these patients were removed from the data element IV Thrombolytic Initiation. Abstraction guidelines for several data elements were also modified to address questions received from data abstractors. The timeframe for documentation of a Reason for Not Initiating IV Thrombolytic was specified as the day of or day after hospital arrival to prevent late entries and addendums after discharge. The same timeframe was specified for the new data element Reason for Extending the Initiation of IV Thrombolytic. Stand-alone reasons were specified for both reason data elements, and a new abstraction bullet added that system reasons are not acceptable. For the data elements Date Last Known Well, Last Known Well, and Time Last Known Well, abstraction guidelines were clarified to address questions about multiple times or conflicting time documentation in the medical record. A sample of vendors and their hospital customers were surveyed to obtain feedback on these changes prior to implementation.

All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must all transition to a new set of codes for electronic health care transactions on October 1, 2015.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Acute ischemic stroke patients for whom IV thrombolytic therapy was initiated at this hospital within 3 hours (less than or equal to 180 minutes) of time last known well.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Five data elements are used to calculate the numerator:

- Date Last Known Well – The month, date, and year prior to hospital arrival at which the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.
- Time Last Known Well – The time (military time) prior to hospital arrival at which the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.
- IV Thrombolytic Initiation – Documentation that intravenous (IV) thrombolytic therapy (t-PA) was initiated at this hospital. Allowable values: Yes, No/UTD or unable to determine from medical record documentation.
- IV Thrombolytic Initiation Date – The month, date, and year the IV thrombolytic therapy was initiated to a patient with ischemic stroke at this hospital.
- IV Thrombolytic Initiation Time - The time (military time) for which IV thrombolytic therapy was initiated to a patient with ischemic stroke at this hospital.

Patients are eligible for the numerator population when the IV Thrombolytic Initiation Date and IV Thrombolytic Initiation Time minus Date Last Known Well and Time Last Known Well >/= 0 minutes and </= 180 minutes.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Acute ischemic stroke patients whose time of arrival is within 2 hours (less than or equal to 120 minutes) of time last known well.

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Fourteen data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Arrival Date – The earliest documented month, day, and year, the patient arrived at the hospital.
3. Arrival Time - The earliest documented time (military time) the patient arrived at the hospital.
4. Birthdate - The month, day and year the patient was born.
5. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
6. Date Last Known Well – The month, date, and year prior to hospital arrival at which the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.
7. Discharge Date – The month day and year the patient was discharged from acute care, left against medical advice or expired during the stay.
8. ED Patient – Documentation that the patient received care in a dedicated emergency department of the facility.
Allowable values: Yes or No/UTD.
9. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
10. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.
11. Last Known Well – Documentation of the date and time prior to hospital arrival at which it was witnessed or reported that the patient was last known to be without the signs or symptoms of the current stroke or at his or her baseline state of health.

Allowable values: Yes or No/UTD.
12. Reason for Extending the Initiation of IV Thrombolytic – Physician/APN/PA or pharmacist documentation of a reason for extending the initiation of IV thrombolytic.
Allowable values: Yes or No/UTD.
13. Reason For Not Initiating IV Thrombolytic – Physician/APN/PA or pharmacist documentation of a reason for not initiating IV thrombolytic.
Allowable values: Yes or No/UTD.
14. Time Last Known Well – The time (military time) prior to hospital arrival at which the patient was last known to be without the signs and symptoms of the current stroke or at his or her baseline state of health.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic stroke as defined in Appendix A, Table 8.1.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
• Less than 18 years of age
• Length of Stay > 120 days
• Enrolled in clinical trials related to stroke
• Admitted for elective carotid intervention
• Time last known well to arrival in the emergency department greater than 2 hours
• Documented reason for extending the initiation of IV thrombolytic
• Documented reason for not initiating IV thrombolytic

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
• The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.
• The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is greater than 120 days, the patient is excluded.
• Patients are excluded if "Yes" is selected for Clinical Trial.
• Patients are excluded with ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3, if medical record documentation states that the patient was admitted for the elective performance of this procedure.
• Patients with time last known well to arrival in the emergency department greater than 2 hours are excluded.
• Patients are excluded if “Yes” is selected for Reason for Extending the Initiation of IV Thrombolytic.
• Patients are excluded if "Yes" is selected for Reason For Not Initiating IV Thrombolytic.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable

S.16. **Type of score:**

Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check ICD-10-CM Principal Diagnosis Code
a. If the ICD-10-CM Principal Diagnosis Code is not on Table 8.1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the ICD-10-CM Principal Diagnosis Code is on Table 8.1, continue processing and proceed to ED Patient.

3. Check ED Patient
a. If ED Patient is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If ED Patient equals No, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If ED Patient equals Yes, continue processing and proceed to Clinical Trial.

4. Check Clinical Trial
a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

5. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Arrival Date.

6. Check Arrival Date
a. If the Arrival Date is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the Arrival Date equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the Arrival Date equals a Non-Unable To Determine (non-UTD) Value, continue processing and proceed to Arrival Time.

7. Check Arrival Time only if the Arrival Date is a Non Unable to Determine (non-UTD) Value
a. If the Arrival Time is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the Arrival Time equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the Arrival Time equals a Non-Unable To Determine (non-UTD) Value, continue processing and proceed to Last Known Well.

8. Check Last Known Well
a. If Last Known Well is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Last Known Well equals No, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Last Known Well equals Yes, continue processing and proceed to Date Last Known Well.

9. Check Date Last Known Well
a. If the Date Last Known Well is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop

processing.
b. If the Date Last Known Well equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the Date Last Known Well equals a Non-Unable To Determine (non-UTD) Value, continue processing and proceed to Time Last Known Well.

10. Check Time Last Known Well only if the Date Last Known Well is a Non Unable to Determine (non-UTD) Value
a. If the Time Last Known Well is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the Time Last Known Well equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the Time Last Known Well equals a Non Unable To Determine (non-UTD) Value, continue processing and proceed to the Timing I calculation.

11. Calculate Timing I only if the Time Last Known Well is a Non Unable to Determine (non-UTD) Value. Timing I, in minutes, is equal to the Arrival Date and the Arrival Time minus the Date Last Known Well and the Time Last Known Well. Calculate Timing I for each case that has a Non Unable to Determine (non-UTD) date and time combination.
a. If the time in minutes is greater than 120, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the time in minutes is greater than or equal to zero and less than or equal to 120, continue processing and proceed to IV Thrombolytic Initiation.

12. Check IV Thrombolytic Initiation
a. If IV Thrombolytic Initiation is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If IV Thrombolytic Initiation equals No, continue processing and proceed to Reason for Not Initiating IV Thrombolytic.
c. If IV Thrombolytic Initiation equals Yes, continue processing and check IV Thrombolytic Initiation Date.

13. Check Reason for Not Initiating IV Thrombolytic
a. If Reason for Not Initiating IV Thrombolytic is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Not Initiating IV Thrombolytic equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If Reason for Not Initiating IV Thrombolytic equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

14. Check IV Thrombolytic Initiation Date
a. If the IV Thrombolytic Initiation Date is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the IV Thrombolytic Initiation Date equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the IV Thrombolytic Initiation Date equals a Non Unable To Determine (non-UTD) Value, continue processing and proceed to IV Thrombolytic Initiation Time.

15. Check IV Thrombolytic Initiation Time only if the IV Thrombolytic Initiation Date is a Non Unable to Determine (non-UTD) Value
a. If the IV Thrombolytic Initiation Time is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the IV Thrombolytic Initiation Time equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the IV Thrombolytic Initiation Time equals a Non Unable To Determine (non-UTD) Value, continue processing and proceed to the Timing II calculation.

16. Calculate Timing II. Timing II, in minutes, is equal to the IV Thrombolytic Initiation Date and the IV Thrombolytic Initiation Time minus the Date Last Known Well and the Time Last Known Well. a. If the time in minutes is greater than 270, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
b. If the time in minutes is greater than or equal to zero and less than or equal to 270, continue processing and proceed to recheck Timing II.

c. If the time in minutes is less than zero, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.

17. Recheck Timing II a. If the time in minutes is greater than or equal to zero and less than or equal to 180, the case will proceed to a Measure category Assignment of E and will be in the Numerator Population. Stop processing.
b. If the time in minutes is greater than 180 and less than or equal to 270, continue processing and proceed to Reason for Extending the Initiation of IV Thrombolytic.

18. Check Reason for Extending the Initiation of IV Thrombolytic a. If Reason for Extending the Initiation of IV Thrombolytic is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Extending the Initiation of IV Thrombolytic equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Reason for Extending the Initiation of IV Thrombolytic equals No, the case will proceed to a Measure Category Assignment D and will be in the Measure Population. Stop processing.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
The Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45
If "N" 6-44, No sampling; 100% Initial Patient Population required
If "N" 0-5, Submission of patient level data is not required; if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Monthly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N >/= 300, then "n" 60
If "N 76-299, then "n" 20% of Initial Patient Population size
If "N 15-75, then "n" 15
If "N < 15, No sampling; 100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the

data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
0437_MeasureTesting_MSF5.0_Data-635905384294673612.doc

NQF #: 0437 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.*)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on this measure are as follows:
170 health care organizations representing various hospital demographics:
17 For Profit; 144 Not for Profit; 9 Government
62 >=300 beds; 71 100-299 beds; 37 <100 beds
142 Urban; 28 Rural
22 Teaching; 148 Non-teaching
States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI
15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:
At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify of potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity

- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:
Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 98.1%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-4.

Data Elements	total 'n' numerator	total 'n' denominator	agreement rate
Clinical Trial	712	714	99.7%
Date Last Known Well	181	206	87.9%
ED Patient	693	695	99.7%
Elective Carotid Intervention	711	714	99.6%
IV Thrombolytic Initiation	215	237	90.7%
IV Thrombolytic Initiation Date	25	27	92.6%
IV Thrombolytic Initiation Time	23	27	85.2%
Last Known Well	417	478	87.2%
Reason for Not Initiating IV Thrombolytic Therapy	155	202	76.7%
Time Last Known Well	157	198	80.0%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:
This measure focuses on determining the proportion of ischemic stroke patients who arrive at this hospital within two hours of time last known well and for whom IV t-PA was initiated at this hospital within three hours of time last known well. This measure is consistent with the AHA guideline recommendations for thrombolytic threrapy administration within three hours of onset of ischemic stroke.

IV t-PA (i.e., Activase, Alteplase, recombinant tissue plasminogen activator) is the only approved IV thrombolytic for stroke as specified in the data element definition for "IV Thrombolytic Initiation". Patients less than 18 years of age that have a length of stay (LOS) more than 120 days, or enrolled in a clinical trial related to stroke are excluded. In addition, patients who were discharged to a health care facility for hospice care, home for hospice care, who expired or who left against medical advice are excluded to harmonize with other CMS/Joint Commission measures.

There are three exclusions that do not appear in the guideline recommendations. First, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure. Patients whose arrival time in the emergency room is greater than two hours from time last known well are also excluded because operationally it is unlikely that IV t-PA can be administered within 3 hours. Lastly, patients with a contraindication to thrombolytic therapy or a documented reason why therapy was not initiated are excluded from the measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:
At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in

the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of the measure. And finally, the conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:
Analysis of feedback obtained via our automated feedback system reveals 121 submissions regarding specifications for this measure over the past year. Predominantly, questions involve the data elements Last Known Well, Date Last Known Well, and Time Last Known Well. Non-specific time documentation, such as time ranges (e.g., 1 – 2 hours) and references to a time of day, (e.g., morning, last night), as well as multiple times documented in the medical record by the same or different individuals, challenge abstractors. Stroke severity and fluctuation in presenting symptoms raise questions as to when the clock starts and when it stops. Users have indicated that the hierarchy for date and time documentation provided in the data element notes for abstraction is helpful in such situations. Additionally, abstraction guidelines were added with examples to clarify that time last known well must be prior to arrival time at the hospital because the measure rate calculation cannot accommodate a negative number.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:
Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.

These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a length of stay (LOS) greater than 120 days
3. Patients enrolled in clinical trials
4. Patients admitted for Elective Carotid Intervention
5. Patients with a documented Reason For Not Initiating IV Thrombolytic

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*
N=39,812

1. Patients < 18 years old = 0%
2. Patients who have a length of stay (LOS) greater than 120 days = 0%
3. Patients enrolled in clinical trials =0.39%

4. Patients admitted for Elective Carotid Intervention = 9.96%
5. Patients with a documented Reason For Not Initiating IV Thrombolytic = 0.95%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:
Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:
Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:
Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:
The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:
STK-4 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	104	0.64221	0.40419	1	1	0.8	0.25	0
2Q2011	114	0.65061	0.40260	1	1	0.85714	0.33333	0
Q12011	116	0.6109	0.42108	1	1	0.775	0.0625	0
4Q2010	105	0.65572	0.40568	1	1	0.84615	0.33333	0
3Q2010	104	0.60829	0.42134	1	1	0.75	0	0
2Q2010	101	0.61933	0.38988	1	1	0.66667	0.33333	0
1Q2010	76	0.53939	0.41284	1	1	0.66667	0	0
4Q2009	39	0.54417	0.41298	1	1	0.625	0.03704	0

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)
2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*: Multiple data sources are not used for this measure. 2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*: Not applicable 2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*: Not applicable
2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)
2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities. 2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain: Although some evidence exists that minorities are less likely to receive thrombolytic therapy, there are no plans to stratify the measure. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data, might be collected reliably in the future.
2.1-2.3 Supplemental Testing Methodology Information:
Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met? (*Reliability and Validity must be rated moderate or high*) Yes☐ No☐ Provide rationale based on specific subcriteria:
If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b6)

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☐ **Critical data elements** (*data element validity must address ALL critical data elements*)

☐ **Performance measure score**

- ☐ **Empirical validity testing**
- ☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year of data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospital selection was based on those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospitals patient level data from The Joint commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:
N=1,318 hospitals
n= 2, 206,379 patients records

STK-4
Median: 93%
Percentile 10%: 0%
Percentile 25%: 75%
Percentile 75%: 100%
Percentile 90%: 100%

Pearson Correlation Coefficients Prob > |r| under H0: Rho=0 Number of Observations							
	STK_1	STK_2	STK_3	STK_4	STK_5	STK_6	STK_10
STK_1	1.00000 1318	0.55423 <.0001 1318	0.30311 <.0001 1302	0.37009 <.0001 1144	0.52785 <.0001 1318	0.53082 <.0001 1318	0.45291 <.0001 1318
STK_2	0.55423 <.0001 1318	1.00000 1318	0.37566 <.0001 1302	0.28169 <.0001 1144	0.53355 <.0001 1318	0.47326 <.0001 1318	0.29578 <.0001 1318
STK_3	0.30311 <.0001 1302	0.37566 <.0001 1302	1.00000 1302	0.25551 <.0001 1137	0.25665 <.0001 1302	0.28198 <.0001 1302	0.15819 <.0001 1302
STK_4	0.37009 <.0001 1144	0.28169 <.0001 1144	0.25551 <.0001 1137	1.00000 1144	0.22516 <.0001 1144	0.43717 <.0001 1144	0.41076 <.0001 1144
STK_5	0.52785 <.0001 1318	0.53355 <.0001 1318	0.25665 <.0001 1302	0.22516 <.0001 1144	1.00000 1318	0.35302 <.0001 1318	0.39079 <.0001 1318
STK_6	0.53082 <.0001 1318	0.47326 <.0001 1318	0.28198 <.0001 1302	0.43717 <.0001 1144	0.35302 <.0001 1318	1.00000 1318	0.45420 <.0001 1318
STK_10	0.45291 <.0001 1318	0.29578 <.0001 1318	0.15819 <.0001 1302	0.41076 <.0001 1144	0.39079 <.0001 1318	0.45420 <.0001 1318	1.00000 1318

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicate convergent validity of the measures.
STK-04 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days

- Patient enrolled in a Clinical Trial
- Patients admitted for *Elective Carotid Intervention*
- *Time Last Known Well* to arrival in the emergency department greater than 2 hours
- Patients with a documented *Reason For Extending the Initiation of IV Thrombolytic*
- Patients with a documented *Reason For Not Initiating IV Thrombolytic*

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: *Time Last Known Well* to arrival in the emergency department greater than 2 hours
None

Exclusion: Patients with a documented *Reason For Not Initiating IV Thrombolytic*
Overall Occurrence n = 73,966
Overall Occurrence Percentage: 24%
Minimum: 0.42%
10th Percentile: 5.5%
Median: 14.6%
90th Percentile: 54%
Maximum: 92%

Exclusion: Patients with a documented *Reason For Extending the Initiation of IV Thrombolytic*
Overall Occurrence = 2,208
Overall Occurrence Percentage: 0.70%
Minimum: 0.09%
10th Percentile: 0.25%
Median: 0.69%
90th Percentile: 2.3%
Maximum: 35.2%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data*

collection and analysis. *Note*: ***If patient preference is an exclusion****, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age
Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days
Rationale: Included to harmonize with other CMS/Joint Commission aligned measures.

Patients enrolled in a Clinical Trial
Rationale: Thrombolytic therapy as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require thrombolytic therapy

Patients with a documented Reason For Not Initiating IV Thrombolytic
Rationale: It is inappropriate to treat patients who have a documented reason or contraindication to thrombolytic therapy

Patients with a documented Reason For Extending the Initiation of IV Thrombolytic
Rationale: It may be appropriate to treat select patients within 3 to 4.5 hours

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields. All data elements needed to compute the STK-4 performance measure score have been retooled for capture from electronic sources. Annual updates are performed to match the eCQM specifications to the current version of the chart-abstracted specifications.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use The Joint Commission performance measures, all of which are in the public

domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting Quality Check® http://www.qualitycheck.org/consumer/searchQCR.aspx Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx http://www.jointcommission.org/certification/dsc_home.aspx Disease-Specific Care Certification for Primary Stroke Centers

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

• Name of program and sponsor: Quality Check®; The Joint Commission

• Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or

by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
• Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ Medicare-certified hospitals (2015)

• Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
• Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
• Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

• Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
• Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 Medicare-certified hospitals (2015)

• Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
• Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

• Name of program and sponsor Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

• Name of program and sponsor Hospital Accreditation Program; The Joint Commission
• Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for*

implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

• Progress (trends in performance results, number and percentage of people receiving high-quality healthcare) The rate of intravenous thrombolytic (t-PA) administration has improved by 57.8% over the past five years based on Joint Commission ORYX performance measurement data. This trend is consistent with increases in the rate of IV t-PA administration reported in multiple published studies. Other trends identified in the literature include: an increasing interest in the concept of treating patients with milder symptoms or rapid improvement; an increased proportion of very old (> 85 years) acute ischemic stroke patients receiving tPA; an increased proportion of young acute ischemic stroke patients (mean age 37 years), in particular young blacks, receiving tPA; and, a slight increase in the proportion of women receiving tPA. Additionally, an increased trend in the rate of tPA utilization for urban patients treated at urban hospitals, as well as, rural patients treated at rural hospitals has been reported.

• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1099 hospitals; 14,907 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Guidelines for the expansion of the time window for treatment of acute ischemic stroke with intravenous tissue plasminogen activator (American Heart Association/American Stroke Association, 2009) have been challenging for STK-4 Thrombolytic Therapy which includes only those patients who receive IV t-PA within 3 hours in the numerator population. The updated guideline recommendation for IV t-PA administration within 3 to 4.5 hours after stroke generated discussion about the STK-4 measure construct and the possibility of revising the STK-4 numerator to include patients treated within 4.5 hours. This recommendation also generated concern that thrombolytic therapy initiation would be delayed for patients eligible to receive treatment within 3 hours and result in poorer outcomes for stroke patients. Since earlier initiation is associated with better neurological outcomes, the STK-4 numerator has remained unchanged; however, the measure specifications have been modified to clearly exclude patients who are treated with IV t-PA within 3 to 4.5 hours and have a documented medical or patient reason for the delay in initiation. An unexpected benefit of this change is that it promotes healthcare staff awareness that earlier initiation of thrombolytic therapy is better for stroke patients and also preserves the goal of the NINDS investigators to initiate thrombolytic treatment for eligible patients within 3 hours.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually

both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0164 : Fibrinolytic Therapy received within 30 minutes of hospital arrival
0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered
0288 : Fibrinolytic Therapy Received Within 30 Minutes of ED Arrival
1952 : Time to Intravenous Thrombolytic Therapy

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0242 : Stroke and Stroke Rehabilitation: Tissue Plasminogen Activator (t-PA) Considered
American Medical Association - Physician Consortium for Performance Improvement (AMA-PCPI) – no longer NQF endorsed

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0288 and 0164 are AMI (Acute Myocardial Infarction) measures. They are part of the Centers for Medicare & Medicaid Services/The Joint Commission aligned measures relating to the administration of fibrinolytic therapy for hospital inpatients and are harmonized with 0437 to the extent that the measures utilize some of the same data elements. The target population for 0288 and 0164 is inpatients with an ICD-10-CM Principal Diagnosis Code for acute myocardial infarction. The target population for 0437 differs in that it includes patients hospitalized for acute ischemic stroke. In addition, the evidence around the timeframe for administration of therapy is different for the AMI and ischemic stroke populations, and 0288 and 0164 include administration of lytic drugs other than activase/alteplase/IV t-PA/recombinant tissue plasminogen activator (rt-PA). Measure 0164 will be removed from the CMS/The Joint Commission aligned measures starting with 01/01/2016 discharges. The target population for measure 1952 from the American Heart Association/American Stroke Association also includes patients hospitalized for acute ischemic stroke; however, the measure captures average door-to-needle time and uses a target of less than 60 minutes rather than the proportion of patients who arrive within 2 hours and receive t-PA within 3 hours of time last known well. Measure 0242 is a physician performance measure with a targeted population of ischemic stroke patients identified through CPT codes and could extend to the outpatient setting. This measure evaluates physician practice as opposed to hospital processes. It is no longer NQF-endorsed

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

To navigate the links in the worksheet: Ctrl + click link to go to the link; ALT + LEFT ARROW to return

Brief Measure Information

NQF #: 0438
Measure Title: STK 05: Antithrombotic Therapy By End of Hospital Day Two
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients who had antithrombotic therapy administered by end of hospital day two (with the day of arrival being day 1).
This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-6: Discharged on Statin Medication, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of early antithrombotic administration in reducing stroke mortality recurrence rates has been demonstrated in several large clinical trials. Data suggest that antithrombotic therapy should be administered by the end of hospital day two to reduce stroke mortality and morbidity as long as no contraindications exist.
Healthcare organizations that track early antithrombotic therapy for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic stroke patients who had antithrombotic therapy administered by end of hospital day two.
Denominator Statement: Ischemic stroke patients
Denominator Exclusions:
- Less than 18 years of age
- Duration of Stay < 2 days
- Length of Stay > 120 days
- Comfort measures only documented on the day of or day after hospital arrival
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- IV OR IA thrombolytic therapy administered at this hospital or within 24 hours prior to arrival
- Documented reason for not administering antithrombotic therapy by end of hospital day 2

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence
Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012:

- The body of evidence consistently supports that early antithrombotic therapy reduces the risk of non-fatal stroke and death for patients who have experienced an acute ischemic stroke. There is no evidence refuting the benefit of this recommendation.
- Class I, Level of Evidence A – AHA ASA 2007 Guidelines for the Early Management of Adults with Ischemic Stroke, page 1681.
    - The oral administration of aspirin (initial dose is 325 mg) within 24 to 48 hours after stroke onset is recommended for treatment of most patients (Class I, Level of Evidence A). This recommendation has changed in that a dose of aspirin is now included.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**

☐ **The developer provided updated evidence for this measure:**

Guidance from the Evidence Algorithm:

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: high; Consistency high(Box 5) → Box 5a High

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

- The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	137	157	158	263	1,300
# cases (den)	18,728	22,328	22,258	33,651	162,275
National aggregate rate	0.97	0.98	0.98	0.98	0.99
Mean hospital rate	0.96	0.96	0.98	0.98	0.98
50th percentile	0.98	0.99	0.99	0.99	0.99
10th and 90th percentiles	0.91 (10th) 1.00 (90th)	0.92 (10th) 1.00 (90th)	0.95 (10th) 1.00 (90th)	0.96 (10th) 1.00 (90th)	0.96 (10th) 1.0 (90th)

- Participation in this measure has grown significantly in the past five years. National hospital performance seems to be very high with little to no room for improvement.
- In 2012, the Committee noted the high performance for this measure (98%), but agreed that even a relatively small increase in performance would affect a large number of patients.

Disparities:

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Performance over five years has been consistently high. How much further improvement in performance is likely using this measure?*
- *Does a gap in care still exist that warrants this national performance measure?*
- *Is there evidence that a gap in care still exits for minority populations? How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **This is a process measure to assess rate of administration of aspirin by end of hospital day two in patients with ischemic stroke. Evidence is good that aspirin prevents additional strokes if administered early and recommendations from professional groups are strong for administration within 24-48 hours of acute event. Evidence for measure has not changed. Agree with preliminary ratings.

**No new evidence since 2012

**This is a maintenance process measure. I am not aware of any new evidence since the measure was last evaluated.

**No evidence changes reported since last evaluation. No vote

1b. Performance Gap

Comments: **Performance over 5 years has been very high. No evidence is provided that a gap exists in this measure for minority populations.

Agree little opportunity for improvement.

**99% participation with little room for improvement
**Performance data was provided and does NOT demonstrate a significant gap in care. Data on disparities was NOT provided, but if it were available, this measure could be used to determine if there are differences in performance in minority populations.
**Higher participation over time. Only a small room for improvement - though this may represent significant numbers of individuals affected.
No data on disparities. Very possible the disparities may account for a large portion of the room for improvement.

1c. High Priority (previously referred to as High Impact)

Comments: **Clear construction.
**NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- One data element defines the numerator and 10 data elements define the denominator.
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke).
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.
- The measures is specified at the hospital level of analysis.
- The developer states that there have been no significant changes to this measure since the last endorsement date.
- In 2012, one Committee member requested clarification regarding the definition of the antithrombotic regimen—specifically whether it includes only aspirin therapy. The developer noted that all FDA-approved or guideline-endorsed antithrombotic agents are listed in a data dictionary for the measure.

Questions for the Committee :

- *Are all the data elements clearly defined? Are all appropriate codes included?*
- *Is the logic or calculation algorithm clear?*
- *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

For maintenance measures, summarize the reliability testing from the prior review:

- Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 97.2%.
  - Five data elements found ≥95% agreement: Antithrombotic Therapy Administered by End of Hospital Day 2 (95.0%), Clinical Trial (99.7%), Comfort Measures Only (99.3%), Elective Carotid Intervention (99.6%), and IV OR IA Thrombolytic Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival (97.5%).
  - One data element found < 95% agreement: Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2 (93.6%).
  - No Kappa scores provided.

- The 2012 Committee expressed no concerns regarding reliability of this measure.

Describe any updates to testing: No new information provided

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing: see above

Results of reliability testing : see above

Guidance from the Reliability Algorithm :

Precise specifications (Box 1) → empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9) → high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

For maintenance measures, summarize the validity testing from the prior review:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users that is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions regarding clarification of the data element Reason for Not Prescribing Antithrombotic Therapy By End of Hospital Day 2, with respect to both acceptable reasons and the timeframe for documentation. Inquiries about new anticoagulants dabigatran and rivaroxaban pertaining to inclusion of patients taking these medications in the numerator were also received. The medication Table 8.2 has been updated to include these medications.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**

☒ **Empirical validity testing of the measure score**

Validity testing method:

- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:
  - Patients less than 18 years of age
  - Patients who have a Duration of Stay less than 2 days
  - Patient who have a Length of Stay greater than 120 days
  - Patients with Comfort Measures documented on day of or day after arrival
  - Patient enrolled in a Clinical Trial

- Patients admitted for Elective Carotid Intervention
- Patients discharged prior to the end of hospital day 2
- Patients with IV OR IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival
- Patients with a documented Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2

- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Comfort Measures Only: 4.46% (range 0.31-30.8%)
  - Clinical Trial: 0.25% (range 0.08-10.0%)
  - Patients admitted for Elective Carotid Intervention: 11.8% (range 0.16-95.2%)
  - Patients with IV OR IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival: 8.04% (range 0.25-47.4%)
  - Patients with a documented Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2: 7.11% (range 0.35-76.9%)

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not Applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →moderate confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **No concerns.

**No concerns
**Data elements are clearly defined. No concerns.
**Specifications are consistent with the evidence.
**Very high - includes face validity. No need to vote.

2a2. Reliability Testing

Comments: **Agree that score from this measure is an indicator of quality.
**No concerns
**New empirical validity testing provided: Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.
**Very high - no need for vote.
May warrant examination for different anti-thrombolitics other than aspirin.
**Agree- no need for discussion on reliability.
**No concerns
**Prior reliability testing from 2012 review showed inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records with an overall agreement rate of 97.2%. Only one data element had < 95% agreement, Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2 (93.6%). No new info provided since 2012 review.

2b2. Validity Testing

Comments: **No
**No concerns re-threats to validity
**The developer does not provide info on frequency of missing data or potential impact.
**Exclusions are appropriate
No Risk Adjustments
Missing data - proposal for handling, no data on frequency.
**Agree that score from this measure is an indicator of quality.
**New empirical validity testing provided: Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **Agree- no need for discussion on reliability.
**No concerns
**Prior reliability testing from 2012 review showed inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records with an overall agreement rate of 97.2%. Only one data element had < 95% agreement, Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2 (93.6%). No new info provided since 2012 review.
**Very high - no need for vote.
**No concerns re-threats to validity
**The developer does not provide info on frequency of missing data or potential impact.
**2d. Yes

Criterion 3. Feasibility
Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available.
- Some data elements are in electronic form.
- Data collection burden is significant.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **Actions common in clinical care, charted, should be easy to extract.

**Data elements are manually abstracted from medical records, creating a significant burden.

**Data are in records. Not all hospitals have ability to enter the data in EHR, thus warranted preservation of this chart version.

Chart data warrant additional collection and analysis time. What is the cost-benefit when adherence is so high?

Criterion 4: Usability and Use

Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details :

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care

processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results:
- The developer provided the following progress information on 1,300 hospitals nationwide and 162,275 patients:
  - The rate of early antithrombotic therapy has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 98.5%. A modest gap of approximately 4% still exists for the 10th percentile of hospitals.
  - This trend is consistent with increases in the rate of antithrombotic therapy at discharge published by GWTG-Stroke and PCNASR.
  - Significant and important differences between races in rates of early antithrombotic therapy persist for Hispanics and non-Hispanic blacks (Schwamm, 2010, Qian, 3013; CDC 2014).

Unexpected findings (positive or negative) during implementation:
- Omission of early antithrombotic therapy when indicated may result in poorer neurological outcomes for stroke patients. The timeframe specified for antithrombotic administration is the day of or day after hospital arrival. The two-day timeframe is aligned with the guideline recommendation that aspirin should be administered within 24 to 48 hours of stroke onset.
  - A two-day computation is used rather than abstracting time in precise minutes and hours to ease abstraction burden. Antithrombotic therapy must be administered by 2359 on the day after hospital arrival (day two), or a reason for not administering documented; however, this methodology for abstraction may result in a fall-out from the measure if the patient arrives late in the day on day one and antithrombotic therapy is administered within 48 hours of hospital arrival.

Potential harms: None reported

Feedback :
- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

***Questions for the Committee**:*
- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments
Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **Simple measure easily implemented and reported.

**Continued use should benefit those pts where disparities still exist

**The measure has been used widely to promote high-quality acute stroke care.

**The data are used in accountability. The already high compliance warrants consideration of further exploration of disparities, relative benefit of other anti-thrombolitics and some of the exclusions.

Criterion 5: Related and Competing Measures

Related or competing measures:

- 0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
- 0435 : STK 02: Discharged on Antithrombotic Therapy
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology – not NQF endorsed

Harmonization:

- Measure 0435, Discharged on Antithrombotic Therapy, is the second (STK-2) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in the two measures. #0435 focuses on the prescription of antithrombotic medications at the time of hospital discharge. All other data elements are aligned between the two measures.
- Measure 0068 is a physician level measure with a different target population - patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI).

Pre-meeting public and member comments

No comments were submitted for this measure during the pre-meeting comment period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0438 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.

Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to decrease stroke recurrence rates for ischemic stroke patients by administering aspirin or another antithrombotic medication within 2 days of symptom onset.
Antithrombotic administered by end of hospital day 2 >> secondary stroke prevention >> decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the early management of adults with ischemic stroke. A small but statistically significant decline in risk of mortality and morbidity has been demonstrated when aspirin is administered within 48 hours after onset of stroke. The primary effects of aspirin are due to reduction of early recurrent stroke rather than limitation of neurological consequences of the stroke. The focus of both the performance measure and the body of evidence supports the need for early administration of antithrombotic therapy.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles*): The two most frequently cited trials in the literature are the International Stroke Trial (i.e., 300 mg of aspirin daily versus control; 1994) and the Chinese Acute Stroke Trial(i.e., 160 mg aspirin daily versus control; 1997). Prior to these trials, there was little to no information about the effects of antiplatelet agents on acute ischemic stroke.

In 2002, the Antithrombotic Trialists' Collaboration published a systematic overview of the relevant literature supporting antiplatelet therapy for prevention of death, myocardial infarction, and stroke in high risk patients. The collaboration reviewed 287 studies involving 135,000 patients in comparisons of antiplatelet therapy versus control and 77,000 patients in comparisons of different antiplatelet regimens. Relevant trials were identified through electronic database searches (MEDLINE, Embase, Derwent, Scisearch, and Biosis), searching the trial registers of the Cochrane Stroke and Peripheral Vascular Disease Groups; manual searching of journals, abstracts, and proceedings of meetings; scrutinizing the reference lists of trials and review articles; and professional inquiry, including colleagues and representatives of pharmaceutical companies.

The meta-analysis identified seven randomized control trials encompassing 40,821 patients that focused on the effects of antithrombotic therapy in acute ischemic stroke patients. The patients enrolled in these seven trials received on average three weeks of antiplatelet therapy following the onset of acute stroke symptoms. Overall, antiplatelet therapy resulted in a proportional reduction of 11% in vascular events (i.e., non-fatal stroke or death).

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting early antithrombotic administration for patients with acute ischemic stroke is high. Multiple large randomized control studies have been published that studied the effects of aspirin, aspirin in combination with other antithrombotic agents, and alternative antithrombotic agents as monotherapy. As noted by the AHA/ASA and the American Academy of Neurology, the early administration of antithrombotic therapy, the focus of this measure, has been found to protect against stroke recurrence in the initial weeks following ischemic stroke. The administration of aspirin is not a substitute for other acute interventions, especially intravenous administration of thrombolytic therapy (IV t-PA), for the treatment of acute ischemic stroke. The administration of aspirin as an adjunctive therapy within 24 hours of IV t-PA is also not recommended.

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that early antithrombotic therapy reduces the risk of non-fatal stroke and death for patients who have experienced an acute ischemic stroke. There is no evidence refuting the benefit of this recommendation.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
According to the Antithrombotic Trialists' Collaboration meta-analysis, there is strong evidence on the immediate hazards and net benefits of early antithrombotic administration for the prevention of stroke recurrence. Four of the seven trials included in the trialists' 2002 meta-analysis separated stroke outcomes into those considered to be due to hemorrhagic events and those of ischemic or unknown origin. Antithrombotic therapy produced an absolute excess of 1.9 hemorrhagic strokes per 1,000 patients, which was counterbalanced by an absolute reduction of 6.9 fewer ischemic strokes per 1,000, yielding an overall risk reduction in the risk of any further stroke of 5.4 per 1,000 patients. The excess risk of major extracranial hemorrhage was estimated at about three excess bleeds per 1,000 patients receiving early antithrombotic therapy. An increased risk of bleeding was associated with concurrent heparin administration (i.e., absolute excess 9 bleeds per 1,000 with heparin versus 2 bleeds per 1,000 without heparin.

As previously stated, the benefits of early antithrombotic therapy outweigh the risks of hemorrhage. Aspirin is a cost-effective therapy (Gaspoz, et al., 2002).

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: American Heart Association. During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.13 Grade Assigned to the Body of Evidence: Class I, Level of Evidence A

1c.14 Summary of Controversy/Contradictory Evidence: The benefit of early antithrombotic therapy post ischemic stroke is undisputed. No position against early antithrombotic therapy was noted in the literature; however, the substitution of early antithrombotic therapy for other acute interventions, (i.e., IV t-PA) is not recommended. Additionally, the administration of antithrombotic medications in conjunction with other antithrombotic agents (e.g., heparin) or soon after IV t-PA administration is inadvisable.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on January 6, 2007. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the <u>developer's assessment</u> of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: High1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0438_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. The effectiveness of early antithrombotic administration in reducing stroke mortality recurrence rates has been demonstrated in several large clinical trials. Data suggest that antithrombotic therapy should be administered by the end of hospital day two to reduce stroke mortality and morbidity as long as no contraindications exist.

Healthcare organizations that track early antithrombotic therapy for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-5 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 1955 denominator cases; 1875 numerator cases; 49 hospitals; 0.95908 national aggregate rate; 0.95947 mean of hospital rates; 0.10574 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.94949 50th percentile rate/median rate; 0.85165 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2010: 18,728 denominator cases; 18,223 numerator cases; 137 hospitals; 0.97304 national aggregate rate; 0.95924 mean of hospital rates; 0.08189 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98361 50th percentile rate/median rate; 0.96183 25th percentile rate/lower quartile; and, 0.90909 10th percentile rate.

CY 2011: 22,328 denominator cases; 21,814 numerator cases; 157 hospitals; 0.97698 national aggregate rate; 0.95933 mean of hospital rates; 0.10243 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98667 50th percentile rate/median rate; 0.96053 25th percentile rate/lower quartile; and, 0.928 10th percentile rate.

CY 2012: 22,258 denominator cases; 21,866 numerator cases; 158 hospitals; 0.98239 national aggregate rate; 0.98042 mean of hospital rates; 0.03174 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99396 50th percentile rate/median rate; 0.97143 25th percentile rate/lower quartile; and, 0.95098 10th percentile rate.

CY 2013: 33,651 denominator cases; 33,133 numerator cases; 263 hospitals; 0.98461 national aggregate rate; 0.97976 mean of hospital rates; 0.04874 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99422 50th percentile rate/median rate; 0.9781 25th percentile rate/lower quartile; and, 0.95745 10th percentile rate.

CY 2014: 162,275 denominator cases; 159.848 numerator cases; 1300 hospitals; 0.98504 national aggregate rate; 0.97832 mean of hospital rates; 0.07287 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99261 50th percentile rate/median rate; 0.97832 25th percentile rate/lower quartile; and, 0.95707 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not applicable

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer, et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).
In terms of early antithrombotic administration, no significant disparities were noted across studies. Recent cross-sectional studies from nationwide health surveys suggest that once patients have a stroke, the use of most risk-reduction strategies does not vary significantly by race. An analysis of 1045 veteran patients found the use of aspirin similar for blacks or African Americans and whites, although the intervention was underutilized with aspirin administration in approximately 74% for both groups (Ross and Bravata, 2009). Similarly, data from the Centers for Disease Control (CDC) Behavioral Risk Factor Surveillance System (BRFSS) showed that black or African American stroke survivors were no less likely to be prescribed aspirin than whites.

Since the last endorsement date, several studies have reported results similar to those from BRFSS in 2009. Schwamm and colleagues (2010) found significant and important differences in quality of care related to early antithrombotics when multivariate models were constructed adjusting for patient-level characteristics only. Race/ethnicity Black versus White: unadjusted OR 0.96 [95% CI 0.92-1.00]; adjusted for patient characteristics OR 0.90 [95% CI 0.86-0.94]; adjusted for patient and hospital characteristics OR 0.97 [95% CI 0.91-1.02]. Race/ethnicity Hispanic versus White: unadjusted OR 0.95 [95% CI 0.88-1.02]; adjusted for patient characteristics OR 0.89 [95% CI 0.83-0.96]; adjusted for patient and hospital characteristics OR 0.96 [95% CI 0.88-1.05]. Total N=271,769; All n 94.23%; White 94.28%; Black 94.08%; Hispanic 93.98%.

A more recently published study (Qian F, et al, 2013) from GWTG found that non-Hispanic black patients were less likely to receive early antithrombotics when compared to other race/ethnicity groups. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for early antithrombotic therapy: non-Hispanic White (n=170,694) 94.9%; non-Hispanic Black (n=20,514) 94.0%; Hispanic (n=6632) 94.3%; and non-Hispanic Asian American (n=3060) 94.8% Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) for early antithrombotic therapy were similar (n=58,823): White 96.5%; Other Race 95.6% (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 (P<0.05).168 (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

Antithrombotic agents significantly reduce the incidence of a recurrent vascular event after a stroke. Among these agents, aspirin has been the drug most widely studied. The International Stroke Trial demonstrated that antithrombotic administration, specifically aspirin, within the first 48 hours after stroke, significantly reduced the risk recurrent ischemic stroke and death (11.3% vs. 12.4%) in

the first 14 days following the event. In conjunction with this, findings from the Chinese Acute Stroke Trial indicate that aspirin produces a modest reduction of approximately 10 deaths per 1000 during the first few weeks. Both trials recommend that aspirin should be given as soon as possible after the onset of stroke symptoms. It appears that the primary benefits of aspirin are due to early reduction in recurrent stroke rather than limitation of neurological deficits of the first stroke. For early antithrombotic therapy, oral administration of aspirin (initial dose is 325 mg) within 24 to 48 hours after stroke onset remains the current clinical guideline recommendation for treatment of most patients (Jauch, E. C., et al., 2013; Sandercock, P. A., et. al., 2014).

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1-635878644173852080.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
There have been no significant changes to the STK-05: Antithrombotic Therapy By End of Hospital Day 2 measure since the last endorsement date.

All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must transition to a new set of codes for electronic health care transactions on October 1, 2015.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic stroke patients who had antithrombotic therapy administered by
end of hospital day two.

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
One data element is used to calculate the numerator:
• Antithrombotic Therapy Administered by End of hospital Day 2 – Documentation that antithrombotic therapy is administered by

the end of hospital day 2. Allowable values: Yes, No/UTD or unable to determine from medical record documentation.

Patients are eligible for the numerator population when the allowable value equals "yes" for the data element.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Ischemic stroke patients

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Ten data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Arrival Date – The earliest documented month, day, and year the patient arrived at the hospital.
3. Birthdate - The month, day and year the patient was born.
4. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
5. Comfort Measures Only – The earliest day the physician/APN/PA documented comfort measures only after hospital arrival. Allowable values: 1 (Day 0 or 1); 2 (Day 2 or after); 3 (Timing Unclear); 4 (Not Documented/UTD).
6. Discharge Date – The month day and year the patient was discharged from acute care, left against medical advice or expired during the stay.
7. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
8. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.
9. IV OR IA Thrombolytic (t-PA) Therapy Administered at this Hospital or within 24 Hours Prior to Arrival – Documentation demonstrates that the patient received intravenous (IV) or intra-arterial (IA) thrombolytic therapy (t-PA) at this hospital or within 24 hours prior to arrival.
Allowable values: Yes or No/UTD.
10. Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2 – Physician/APN/PA or pharmacist documentation of a reason for not administering antithrombotic therapy by end of hospital day 2.
Allowable values: Yes or No/UTD.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic stroke as defined in Appendix A, Table 8.1

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
- Less than 18 years of age
- Duration of Stay < 2 days
- Length of Stay > 120 days
- Comfort measures only documented on the day of or day after hospital arrival
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- IV OR IA thrombolytic therapy administered at this hospital or within 24 hours prior to arrival
- Documented reason for not administering antithrombotic therapy by end of hospital day 2

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
- The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.

- The Duration of Stay (in days) is equal to the Discharge Date minus the Arrival Date. If the Duration of Stay is less than 2 days, the

patient is excluded.

• The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is greater than 120 days, the patient is excluded.

• Patients with Comfort Measures Only allowable value of 1 (Day 0 or 1) are excluded.

• Patients are excluded if "Yes" is selected for Clinical Trial.

• Patients are excluded with ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3, if medical record documentation states that the patient was admitted for the elective performance of this procedure.

• Patients are excluded if "Yes" is selected for IV (intravenous) or IA (intra- arterial)Thrombolytic Therapy (t-PA)Administered at This Hospital or Within 24 Hours Prior to Arrival.

• Patients are excluded if "Yes" is selected for Reason For Not Administering Antithrombotic Therapy By End of Hospital Day 2.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*
Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)
No risk adjustment or risk stratification
If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*
Not applicable

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*
Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)
Not applicable

S.16. **Type of score:**
Rate/proportion
If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*
Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*
1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check ICD-10-CM Principal Diagnosis Code
a. If the ICD-10-CM Principal Diagnosis Code is not on Table 8.1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.

b. If the ICD-10-CM Principal Diagnosis Code is on Table 8.1, continue processing and proceed to Comfort Measures Only.

3. Check Comfort Measures Only
a. If Comfort Measures Only is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Comfort Measures Only equals 1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Comfort Measures Only equals 2, 3, or 4, continue processing and proceed to Clinical Trial.

4. Check Clinical Trial
a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

5. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Arrival Date.

6. Check Arrival Date
a. If the Arrival Date is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If the Arrival Date equals Unable to Determine (UTD), the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.
c. If the Arrival Date equals a Non-Unable To Determine (non-UTD) Value, continue processing and proceed to Duration of Stay calculation.

7. Calculate the Duration of Stay. The Duration of Stay, in days, is equal to the Discharge Date minus the Arrival Date.

8. Check Duration of Stay
a. If the Duration of Stay is greater than or equal to zero and less than 2, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If the Duration of Stay is greater than or equal to 2, continue processing and proceed to IV or IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival.

9. Check IV or IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival
a. If IV or IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If IV or IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If IV or IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival equals No, continue processing and proceed to Antithrombotic Therapy Administered By End of Hospital Day 2.

10. Check Antithrombotic Therapy Administered By End of Hospital Day 2
a. If Antithrombotic Therapy Administered By End of Hospital Day 2 is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Antithrombotic Therapy Administered By End of Hospital Day 2 equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Antithrombotic Therapy Administered By End of Hospital Day 2 equals No, continue processing and check Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2.

11. Check Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2
a. If Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2 is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2 equals Yes, the case will proceed to a Measure

Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Reason for Not Administering Antithrombotic Therapy By End of Hospital Day 2 equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

S.19. **Calculation Algorithm/Measure Logic Diagram URL or Attachment** *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. **Sampling** *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
The Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45
If "N" 6-44, No sampling; 100% Initial Patient Population required
If "N" 0-5, Submission of patient level data is not required; if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Monthly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N >/= 300, then "n" 60
If "N 76-299, then "n" 20% of Initial Patient Population size
If "N 15-75, then "n" 15
If "N < 15, No sampling; 100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance

Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable.

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
0438_MeasureTesting_MSF5.0_Data-635905393038485759.doc

NQF #: 0438 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.*)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009.. Demographics of organizations collecting and reporting data on this measure are as follows:
170 health care organizations representing various hospital demographics:
17 For Profit; 144 Not for Profit; 9 Government
62 >=300 beds; 71 100-299 beds; 37 <100 beds
142 Urban; 28 Rural
22 Teaching; 148 Non-teaching
States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI
15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:
At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with monthly data transmission to The Joint Commission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of approximately 900 patient records identified at 30 pilot sites over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rates of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures.) The following is a list of the major tests conducted on the submitted data for this measure:

- Transmission of complete data
- Usage of data received (to understand if the healthcare organization provides the relevant service to treat the relevant population)
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity

- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors is as follows:
- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:
Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 97.2%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-5.

Data Elements	total'n'numerator	total'n'denominator	rate
Antithrombotic Therapy Administered By End of Hospital Day 2	426	449	95.0%
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
IV OR IA Thrombolytic Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival	464	476	97.5%
Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2	44	47	93.6%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:
This measure focuses on determining the proportion of ischemic stroke patients who had antithrombotic therapy administered by end of hospital day two. The literature supports that antithrombotic administration by end of hospital day two significantly reduces the risk of ischemic stroke recurrence in the initial weeks following the first stroke with minimal risk of a major bleed. The measure specifications are consistent with AHA guideline recommendations for aspirin administration within the first 24 to 48 hours following ischemic stroke onset. This measure excludes patients less than 18 years of age. Also excluded from the measure are patients who have a length of stay (LOS) of less than two days or more than 120 days, those who are enrolled in a clinical trial for stroke or for whom comfort measures only have been ordered on the day of or the day after arrival. These exclusions are not addressed in the literature, but are included for this measure in order to harmonize with other CMS/Joint Commission aligned measures.

The measure specifications differ from guideline recommendations by excluding patients admitted for Elective Carotid Intervention. Operationally, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure. Additionally, patients who receive IV or IA Thrombolytic Therapy at this hospital or within 24 hours prior to arrival are excluded since antithrombotic administration following thrombolytic therapy within this timeframe may increase the risk of hemorrhage, and is therefore, inadvisable.

The computation used to determine the two-day timeframe for this measure is the key difference between the measure specifications and guideline recommendations. The measure specifications use days (i.e., day 1 = day of hospital arrival and day 2 = day after arrival) rather than hours and minutes (i.e., 24 to 48 hours) to compute the end of hospital day 2. This computation benefits both the patient and healthcare organization. One benefit is that it eases the burden of data abstraction. Depending on the patient's time of arrival, there may be less time for administration of antithrombotic therapy for some cases; however, early antithrombotic administration post-stroke is the goal and consistent with the guideline time range recommendation of 24 to 48 hours.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:
At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of this measure. And finally, the conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:
Analysis of feedback obtained via our automated feedback system reveals 72 submissions regarding specifications for this measure over the past year. Predominant themes of these submissions involved questions regarding clarification of the data element Reason for Not Prescribing Antithrombotic Therapy By End of Hospital Day 2, with respect to both acceptable reasons and the timeframe for documentation. Additional notes for abstractors were added to the data element for clarification. Inquiries about new anticoagulants dabigatran and rivaroxaban pertaining to inclusion of patients taking these medications in the numerator were also received. The medication Table 8.2 for the data element Antithrombotic Therapy By End of Hospital Day 2 has been updated to include these medications.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:
Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.
These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a Duration of Stay less than 2 days
3. Patients who have a length of stay (LOS) greater than 120 days
4. Patients with Comfort Measures Only documented on day of or after arrival
5. Patients enrolled in clinical trials
6. Patients admitted for Elective Carotid Intervention

7. Patients with a documented Reason For Not Administering Antithrombotic Therapy By End of Hospital Day 2

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*
N=39,812
1. Patients < 18 years old = 0%
2. Patients who have a Duration of Stay less than 2 days = 8.43%
3. Patients who have a length of stay (LOS) greater than 120 days = 0%
4. Patients with Comfort Measures Only documented = 4.99%
5. Patients enrolled in clinical trials = 0.39%
6. Patients admitted for Elective Carotid Intervention = 9.96%
7. Patients with a documented Reason For Not Administering Antithrombotic Therapy By End of Hospital Day 2 = 2.27%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:
Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:
Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:
Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:
The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of an HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:
STK-5 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	154	0.97045	0.0735	1	1	1	0.9697	0.92857
2Q2011	155	0.96839	0.08678	1	1	1	0.97143	0.93333
1Q2011	159	0.95328	0.12687	1	1	1	0.95833	0.91304
4Q2010	135	0.96697	0.104	1	1	1	0.96667	0.93023
3Q2010	129	0.95443	0.12216	1	1	1	0.96226	0.88889
2Q2010	122	0.95333	0.12219	1	1	1	0.95556	0.90625
1Q2010	100	0.9521	0.12692	1	1	1	0.96	0.87298
4Q2009	49	0.95947	0.10574	1	1	0.98519	0.96875	0.93478

It should be noted that since data collection on this measure is completely voluntary for both The Joint Commission and PCNASR, the hospitals reporting on this measure are self-selected, and therefore, presumably have a particular interest and concern for improving stroke care. For this reason, the measure results demonstrated by this group most likely significantly overstates the rate for the population of all health care organizations.

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Multiple data sources are not used for this measure.

2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*:
Not applicable

2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*:
Not applicable

2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:
There are no plans to stratify the measure. The evidence does not support that minorities are less likely to receive antithrombotic therapy by end of hospital day two. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data, might be collected reliably in the future.

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met?
(*Reliability and Validity must be rated moderate or high*) Yes☐ No☐
Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

2b2. VALIDITY TESTING

2b2.1. What level of validity testing was conducted? (*may be one or both levels*)

☐ **Critical data elements** (*data element validity must address ALL critical data elements*)

☐ **Performance measure score**

☐ **Empirical validity testing**

☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospitals selection was based to those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospitals patient level data from The Joint commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for stroke as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:
N=1,318 hospitals
n= 2, 206,379 patients records

STK-5
Median: 100%
Percentile 10%: 98%
Percentile 25%: 99%
Percentile 75%: 100%
Percentile 90%: 100%

Pearson Correlation Coefficients Prob > |r| under H0: Rho=0 Number of Observations							
	STK_1	STK_2	STK_3	STK_4	STK_5	STK_6	STK_10
STK_1	1.00000 1318	0.55423 <.0001 1318	0.30311 <.0001 1302	0.37009 <.0001 1144	0.52785 <.0001 1318	0.53082 <.0001 1318	0.45291 <.0001 1318
STK_2	0.55423 <.0001 1318	1.00000 1318	0.37566 <.0001 1302	0.28169 <.0001 1144	0.53355 <.0001 1318	0.47326 <.0001 1318	0.29578 <.0001 1318
STK_3	0.30311 <.0001 1302	0.37566 <.0001 1302	1.00000 1302	0.25551 <.0001 1137	0.25665 <.0001 1302	0.28198 <.0001 1302	0.15819 <.0001 1302
STK_4	0.37009 <.0001 1144	0.28169 <.0001 1144	0.25551 <.0001 1137	1.00000 1144	0.22516 <.0001 1144	0.43717 <.0001 1144	0.41076 <.0001 1144
STK_5	0.52785 <.0001 1318	0.53355 <.0001 1318	0.25665 <.0001 1302	0.22516 <.0001 1144	1.00000 1318	0.35302 <.0001 1318	0.39079 <.0001 1318
STK_6	0.53082 <.0001 1318	0.47326 <.0001 1318	0.28198 <.0001 1302	0.43717 <.0001 1144	0.35302 <.0001 1318	1.00000 1318	0.45420 <.0001 1318
STK_10	0.45291 <.0001 1318	0.29578 <.0001 1318	0.15819 <.0001 1302	0.41076 <.0001 1144	0.39079 <.0001 1318	0.45420 <.0001 1318	1.00000 1318

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i*.e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicates convergent validity of the measures.
STK-05 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical analysis was used*)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patients who have a Duration of Stay less than 2 days
- Patient who have a Length of Stay greater than 120 days

- Patients with *Comfort Measures* documented on day of or day after arrival
- Patient enrolled in a Clinical Trial
- Patients admitted for *Elective Carotid Intervention*
- Patients discharged prior to the end of hospital day 2
- Patients with *IV **OR** IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival*
- Patients with a documented *Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2*

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)
There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: *Comfort Measures Only* documented on day of or day after arrival
Overall Occurrence n = 28,126
Overall Occurrence Percentage 4.46%
Minimum 0.31%
10th Percentile: 1.67%
Median: 4.40%
90th Percentile: 9.09%
Maximum: 30.8%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 23.5%
Maximum: 95.2%

Exclusion: Patients with *IV **OR** IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival*
Overall Occurrence n = 25,354
Overall Occurrence Percentage 8.04%
Minimum: 0.25%
10th Percentile: 2.1%
Median: 6.72%
90th Percentile: 13.5%
Maximum: 47.4%

Exclusion: Patients with a documented *Reason for Not Administering Antithrombotic Therapy by End of Hospital Day 2*
Overall Occurrence n = 22,404

Overall Occurrence Percentage 7.11%
Minimum: 0.351%
10th Percentile: 1.48%
Median: 4.16%
90th Percentile: 14.9%
Maximum: 76.9%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age
Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days
Rationale: Included for this measure in order to harmonize with other CMS/Joint Commission aligned measures.

Patients who have a Duration of Stay less than 2
Rationale: Inclusion of patients with a duration of stay shorter than 2 days may falsely increase the denominator population.

Patients with *Comfort Measures Only* documented on day of or day after arrival
Rationale: It is inappropriate to treat such patients beyond those measures necessary for comfort.

Patients enrolled in a Clinical Trial
Rationale: Antithrombotic therapy as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require antithrombotic therapy

Patients with *IV **OR** IA Thrombolytic (t-PA) Therapy Administered at This Hospital or Within 24 Hours Prior to Arrival*
Rationale: It is inappropriate to administer antithrombotic therapy to patients who have received IV or IA thrombolytic therapy within 24 hours

Patients with a documented Reason For Not Administering Antithrombotic Therapy By End of Hospital Day 2
Rationale: It is inappropriate to treat patients who have a documented reason or contraindication to antithrombotic therapy

Patients discharged prior to the end of hospital day 2
Rationale: Inclusion of patients discharged prior to the end of hospital day 2 may falsely increase the denominator population.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields. All data elements needed to compute the STK-5 performance measure score have been retooled for capture from electronic sources. Annual updates are performed to match the eCQM specifications to the current version of the chart-abstracted specifications.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use The Joint Commission performance measures, all of which are in the public

domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting Quality Check® http://www.qualitycheck.org/consumer/searchQCR.aspx Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke http://www.jointcommission.org/certification/dsc_home.aspx http://www.jointcommission.org/certification/dsc_home.aspx Disease-Specific Care Certification for Primary Stroke Centers

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

• Name of program and sponsor: Quality Check®; The Joint Commission

• Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or

by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
• Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ medicare-certified hospitals (2015)

• Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
• Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
• Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

• Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
• Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

• Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
• Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes that specific capabilities of hospitals that treat the most complex stroke cases.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

• Name of program and sponsor Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

• Name of program and sponsor Hospital Accreditation Program; The Joint Commission
• Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data*

aggregation and reporting.)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

•Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)

The rate of early antithrombotic therapy has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 98.5%. A modest gap of ~4% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate of antithrombotic therapy at discharge published by GWTG-Stroke and PCNASR. Significant and important differences between races in rates of early antithrombotic therapy persist for Hispanics and non-Hispanic blacks (Schwamm, 2010, Qian, 3013; CDC 2014).

•Geographic area and number and percentage of accountable entities and patients included Nationwide; 1300 hospitals; 162,275 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Not applicable.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
Omission of early antithrombotic therapy when indicated may result in poorer neurological outcomes for stroke patients. The timeframe specified for antithrombotic administration is the day of or day after hospital arrival. The two-day timeframe is aligned with the guideline recommendation that aspirin should be administered within 24 to 48 hours of stroke onset. A two-day computation is used rather than abstracting time in precise minutes and hours to ease abstraction burden. Antithrombotic therapy must be administered by 2359 on the day after hospital arrival (day two), or a reason for not administering documented; however, this methodology for abstraction may result in a fall-out from the measure if the patient arrives late in the day on day one and antithrombotic therapy is administered within 48 hours of hospital arrival.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**
0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet

0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
0435 : STK 02: Discharged on Antithrombotic Therapy

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0325: Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy – American Academy of Neurology

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Measures 0435 Discharged on Antithrombotic Therapy is the second (STK-2) measure in The Joint Commission stroke core measure set and also targets the ischemic stroke population; however, the timeframe for antithrombotic administration is different in this measure than STK-5. STK-2 focuses on hospital discharge and the prescription of antithrombotic medications at that time. All common data elements are completely aligned between the two measures. Measure 0068 is a physician performance measure and thus a different level of measurement. Measure 0068 encompasses a different target population, specifically patients with ischemic vascular disease who were discharged alive for acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI). Both of these measures evaluate physician practice as opposed to hospital processes

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

Appendix

A.1 Supplemental materials may be provided in an appendix. All supplemental materials (such as data collection instrument or methodology reports) should be organized in one file with a table of contents or bookmarks. If material pertains to a specific submission form number, that should be indicated. Requested information should be provided in the submission form and required attachments. There is no guarantee that supplemental materials will be reviewed.

Measure Developer/Steward Updates and Ongoing Maintenance

Ad.2 **Year the measure was first released:** 2009

Ad.3 **Month and Year of most recent revision:** 10, 2015

Ad.4 **What is your frequency for review/update of this measure?** Biannual

Ad.5 **When is the next scheduled review/update for this measure?** 07, 2016

Ad.7 **Disclaimers:**

Ad.8 **Additional Information/Comments:**

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

To navigate the links in the worksheet: Ctrl + click link to go to the link; ALT + LEFT ARROW to return

Brief Measure Information

NQF #: 0439
Measure Title: STK-06: Discharged on Statin Medication
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic stroke patients who are prescribed a statin medication at hospital discharge.

This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-8: Stroke Education, and STK-10: Assessed for Rehabilitation) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Recent guidelines recommend high-intensity statin therapy for patients with ischemic stroke unless contraindicated or patient characteristics require dosage modification.

Healthcare organizations that track this measure for internal quality improvement purposes have seen an increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic stroke patients prescribed statin medication at hospital discharge
Denominator Statement: Ischemic stroke patients
Denominator Exclusions:
- Less than 18 years of age
- Length of Stay > 120 days
- Comfort measures only documented
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Discharged to another hospital
- Left against medical advice
- Expired
- Discharged to home for hospice care
- Discharged to a health care facility for hospice care
- Documented reason for not prescribing statin medication at discharge

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence
Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Evidence Summary or **Summary of prior review in 2012**

- The body of evidence provided supports that statin therapy should be prescribed for stroke prevention in patients with a prior history of ischemic stroke and transient ischemic attack . Based on these findings, there is a correlation between the use of statins in lowering LDL cholesterol and stoke occurrence. These findings are consistent across several clinical trials.
- 2010 AHA/ASA Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack, page 233.
    - Class I, Level of Evidence B – Statin therapy with intensive lipid-lowering effects is recommended to reduce the risk of stroke and cardiovascular events among patients with ischemic stroke or TIA who have evidence of arthrosclerosis, and LDL-c level > 100 mg/dL, and who are without known CHD.
- The 2012 Committee expressed no concerns regarding the evidence underlying this measure.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**
☐ **The developer provided updated evidence for this measure:**

Exception to evidence

N/A

Guidance from the Evidence Algorithm

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: moderate; Consistency: high (Box 5b) → Moderate

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and there is no need for repeat discussion and voting on Evidence ?*

Preliminary rating for evidence: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

The developer provides the following national trend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	137	157	157	262	1296
# cases (den)	12,042	18,608	18,998	29,350	140,296
National aggregate rate	0.93	0.94	0.96	0.97	0.97
Mean hospital rate	0.89	0.90	0.94	0.95	0.96
50th percentile	0.94	0.94	0.97	0.98	0.99
10th and 90th percentiles	0.71 (10th) 1.00 (90th)	0.79 (10th) 1.00 (90th)	0.84 (10th) 1.00 (90th)	0.87 (10th) 1.00 (90th)	0.90 (10th) 1.00 (90th)

- Participation in this measure has grown significantly in the past five years. National hospital performance seems to be consistently high with little to no room for improvement.
- In 2012, the Committee noted the overall high rate of performance for this measure among reporting hospitals.

Disparities

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Data for 2014 includes 1,296 hospitals. What proportion of hospitals caring for stroke patients is captured in this data?*
- *Performance over five years has been consistently high. How much further improvement in performance is likely using this measure?*
- *Does a gap in care still exist that warrants this national performance measure?*
- *How can this measure be used to better understand disparities in care and outcomes for certain groups?*

Preliminary rating for opportunity for improvement: ☐ High ☐ Moderate ☒ Low ☐ Insufficient

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **This is a process measure that relates directly to the desired outcome.

Maintenance - Original Endorsement Date: Jul 31, 2008 Most Recent Endorsement Date: Nov 01, 2012 - I am not aware of any new studies/information that changes the evidence base for this measure that has not been cited in the submission

**No new studies/information

1b. Performance Gap

Comments: **performance data on the measure was provided

that seems to demonstrate a gap in care and has demonstrated improvement over time which should warrant a national performance measure
data on the measure by population subgroups was not provided?
it does not demonstrate disparities in the care other than clinically but attaches a summary of data that favorably addresses the issue of disparities
**High performance since 2012; no disparities data provided
1c. High Priority (previously referred to as High Impact)
Comments: **All are stated and logical
**NA

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications
Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s): medical record abstraction (paper or electronic). This is not an eMeasure.

Specifications:

- One data element defines the numerator and nine data elements define the denominator.
- Developer reports that "Since the last endorsement date, the measure specifications have been revised to align with current guideline recommendations from the American College of Cardiology (ACC)/ American Heart Association (AHA) for the management of blood cholesterol in adults. The 2013 guidelines recognize four statin benefit groups. Patients with ischemic stroke are included in the first statin benefit group along with other patients who have clinical atherosclerotic cardiovascular disease (ASCVD). For these patients, age 75 years or younger, high-intensity statin therapy is recommended unless contraindicated or patient characteristics predispose to adverse effects. The rationale for the measure was revised to reflect these recommendations, emphasizing that statin therapy is indicated for those ischemic stroke patients with evidence of atherosclerosis, i.e., 'individuals with ischemic stroke due to large artery atherosclerosis, individuals with ischemic stroke due to intrinsic small vessel disease, and individuals with ischemic stroke not directly due to atherosclerosis but with clinically evident atherosclerotic disease in an uninvolved cerebral or noncerebral bed'. The denominator statement was revised to ischemic stroke patients, and the denominator inclusions for patients with LDL greater than or equal to 100 mg/dL, or LDL not measured, or who were on a lipid-lowering medication prior to hospital arrival removed, since they are no longer relevant to current guideline recommendations. Additionally, the data elements that captured these three denominator inclusions were removed from the measure algorithm. Appendix C, Table 1.6 Lipid-Lowering Medications used for abstraction of the data element Pre-Arrival Lipid-Lowering Agent was also removed."
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke).
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015."
- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described.

- The measure is specified at the hospital level of analysis.

Questions for the Committee :

- o *Are all the data elements clearly defined? Are all appropriate codes included?*
- o *Is the logic or calculation algorithm clear?*
- o *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

Reliability testing from prior review in 2012:

- o Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 96.7%.
  - o Two data elements found less than 94% agreement: Reason for Not Prescribing Statin Medication at Discharge (92%) and Pre-Arrival Lipid-Lowering Agent (92%). No Kappa scores were presented.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**
Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing see above
Results of reliability testing see above

Questions for the Committee:

- o *Developer indicates a re-test in 2012, based on an n=33, they indicated agreement of 100% when the measure focus shifted to statin medications – would additional information on that test impact your determination of the continued reliability of this measure?*
- o *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Guidance from the Reliability Algorithm
Precise specifications (Box 1) →empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9)→ high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**
Specification not completely consistent with evidence

Question for the Committee:

- o *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

Validity testing from the prior review in 2012:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions involving the data element Reason for Not Prescribing Statin Medication at Discharge, specifically reasons regarding the absence of documented linkage with statins, e.g., reduction in LDL-c attained with a pre-arrival lipid-lowering agent other than a statin medication.

Describe any updates to validity testing – New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

- ☐ **Face validity only**
- ☒ **Empirical validity testing of the measure score**

Validity testing method:

- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:
  - Patients less than 18 years of age
  - Patient who have a Length of Stay greater than 120 days
  - Patients with Comfort Measures
  - Patient enrolled in a Clinical Trial
  - Patients admitted for Elective Carotid Intervention
  - Patients with a documented Reason For Not Prescribing Statin Medication at Discharge
  - Patients discharged to another hospital

- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Comfort Measures Only: 10% (range 0.30-35.7%)
  - Clinical Trial: 0.52% (range 0.08- 10%)
  - Patients admitted for Elective Carotid Intervention: 11.5% (range 0.16-95.2%)
  - Patients with a documented Reason For Not Prescribing Statin Medication at Discharge: 3.31% (range 0.24%-29.7%)
  - Patients discharged to another hospital: 35.4% (range 0.79-76.2%)
  - Patients who left against medical advice: 0.86% (range 0.06-9.67%)
  - Patients who expired: 5.08% (range 0.39-20.1%)
  - Patients discharged to home for hospice care: 51.9% (range 6.25-94.3%)
  - Patients discharged to a health care facility for hospice care: 3% (range 0.16-23%)

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from the Validity Algorithm
Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →high confidence that scores are a valid indicator of quality (Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications
Comments: **The specifications appear consistent
**Specifications consistent with evidence
2a2. Reliability Testing
Comments: **The validity testing had adequate scope and yhe validity testing results demonstrate sufficient validity such that conclusions about quality can be made. I agree that, for most persons who have suffered an ischemic stroke, the provision of a statin is an essential element of quality
**yes adequate validity testing
2b2. Validity Testing
Comments: **All of the exclusions seem consistent with the evidence
There was no risk adjustment a stratification for this measure.
Reported analyses indicate this measure identifies meaningful differences about quality and have shown steady improvement over time
There does not appear to be missing data which would constitute a threat to the validity of this measure
**No
2b3. Exclusions Analysis
2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures
2b5. Identification of Statistically Significant & Meaningful Differences In Performance
2b6. Comparability of Performance Scores When More Than One Set of Specifications
2b7. Missing Data Analysis and Minimizing Bias
Comments: **The reliability testing had adequate scope and the data supports that this measure reports reliably
**Sufficient reliability

Criterion 3. Feasibility
Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available
- Some data elements are in electronic form
- Data collection burden is significant.

Questions for the Committee:
- o *Are the required data elements routinely generated and used during care delivery?*
- o *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- o *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments
Criteria 3: Feasibility

3a. Byproduct of Care Processes
3b. Electronic Sources
3c. Data Collection Strategy
Comments: **All of the required data elements seem to be routinely generated and used during care delivery and, for those providers who have an EHR, are available in electronic form. The only concern about data collection is the accessibility of an EHR (which is addressed by a companion measure)
**Not all data elements are in EHR

Criterion 4: Usability and Use
Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use

or could use performance results for both accountability and performance improvement activities.

Current uses of the measure
Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

Accountability program details :

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CMS Hospital Compare: Public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results :

- The developer provided the following progress information on 1,296 hospitals nationwide and 140,296 patients:
    - The percentage of ischemic stroke patients with LDL > 100 mg/dL who are discharged on a statin medication has steadily increased over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 98.7%. A modest gap of approximately 5% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate for discharged on a statin medication published by GWTG-Stroke and PCNASR.
    - Significant and important differences persist between races in rates for patients prescribed statin therapy at discharge (Schwamm LH, et al., 2010, Qian F,et al., 2013).

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- The developer did not identify any unintended consequences related to this measure

Feedback :

- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency
4b. Improvement
4c. Unintended Consequences

Comments: **Accountability entities include 3300 joint commission accredited hospitals. The performance results are being used to further the goal of high-quality, efficient healthcare through public reporting to providers, payors and consumers.
I do not note any actual unintended consequences other than the potential that individuals who do not clinically require a statin might be placed on it to fulfill his requirement. However, for the vast majority of persons who have suffered an ischemic stroke, assuring access to a statin far outweighs the much smaller number of persons who will not benefit from the statin but for whom the statin will do no harm.
**Measure publicly reported and used in several accountability programs; high usability

Criterion 5: Related and Competing Measures

Related or competing measures

- 0118: Anti-Lipid Treatment Discharge
- 0068 : Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet
- 0074: Chronic Stable Coronary Artery Disease: Lipid Control
- 0325 : Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy
- 0438 : STK 05: Antithrombotic Therapy By End of Hospital Day Two
- 0543: Adherence to Statin Therapy for Individuals with Cardiovascular Disease
- 0547: Diabetes and Medication Possession Ratio for Statin Therapy
- 0639: Statin Prescribed at Discharge

Harmonization

The developer reports that the following measures address target diagnoses other than ischemic stroke or specific surgical procedures for patients 18 years or older:

- 0074 Coronary Artery Disease - provider-level measures in the ambulatory care setting.
- 0118 isolated Coronary Artery Bypass Graft (CABG) - provider-level measures in the ambulatory care setting.
- 1519 Lower Extremity Bypass (LEB) - addresses inpatient organizational performance

Pre-meeting public and member comments

No public comments were submitted for this measure during the pre-meeting commenting period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0439 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to reduce patient morbidity and mortality through modification of risk factors for stroke, specifically through the use of statin medications to reduce low-density lipoprotein cholesterol (LDL-c). Statin prescribed at discharge >> decreased LDL-c >> secondary stroke prevention >>decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the guidelines recommended by the American Heart Association/American Stroke Association for the prevention of stroke in patients with stroke and transient ischemic attack. An elevated serum lipid level has been a well-documented risk factor for coronary artery disease (CAD). Recently, there has been an increased focus on examining the relationship between elevated lipid levels and the incidence of stroke. In particular, some recent clinical trials have analyzed the association between lipids and non-hemorrhagic stroke. The reduction of LDL cholesterol, through lifestyle modification and drug therapy, for the prevention of strokes and other vascular events is recommended for patients with CAD in the National Cholesterol Education Program Adult Treatment Panel III (NCEP ATP III) Guidelines. In addition, recent evidence from the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) trial supports the use of statins to lower LDL cholesterol in stroke patients without prior CAD and a fasting LDL >/= 100 mg/dL.

Based on these guidelines, all patients with ischemic stroke should have lipid profile measurement performed within 48 hours of admission unless outpatient results are available from within the past 30 days. Treatment for secondary prevention should be initiated in patients who meet NCEP ATP III criteria in the presence of LDL >/= 100 mg/dL, or continued for patients who were previously on lipid-lowering therapy and have an LDL< 100 mg/dL.

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: The number of studies supporting the body of evidence for statin therapy is in the thousands. A recent editorial by Lori Mosca, MD, MPH, PhD published in Journal of the American College of Cardiology (2012) noted more than 2,300 potential studies in the literature related to sex-specific outcomes and the effects of statins on the prevention of cardiovascular disease.

The Third Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III, or ATP III) extensively analyzed the results of 63 clinical trials. Findings from these studies strongly influenced the development of ATP III recommendations (2002).

To date, the single most important study of statin therapy and stroke incidence is The Stroke Prevention by Aggressive Reduction of

Cholesterol Levels (SPARCL) trial. SPARCL randomly assigned 4731 patients who had had a stroke or TIA within one to six months before study entry, had low-density lipoprotein (LDL) cholesterol levels of 100 mg to 190 mg per deciliter (2.6 to 4.9 mmol per liter) and had no known history of coronary heart disease to double-blind treatment with 80 mg of atorvastatin per day or placebo. The incidence of fatal or non-fatal stroke in patients receiving atorvastatin was reduced by 16%. SPARCL is unique in that it is the only trial to study a cohort of patients with no known history of coronary heart disease.

A Cochrane Database of Systematic Review (10 August 2011) identified eight randomized control trials (RCTs) involving 625 participants. The review included all RCTs comparing statins (any type and dosage) versus placebo or no treatment, administered within two weeks of the onset of acute ischemic stroke or TIA. The search strategy included the Cochrane Stroke Group's Trials Register (November 2010); the Cochrane Central Register of Controlled Trials (CENTRAL)(The Cochrane Library 2010, Issue 4): MEDLINE (1950 to November 2010); and EMBASE (1980 to November 2010). In addition, ongoing trials and research registers (November 2010) were also searched and reference lists from relevant articles and contacted authors checked to further identify published, unpublished, and ongoing trials. Two review authors independently selected studies for inclusion and extracted data.
A MEDLINE search, using PubMed, of all literature related to "Hydroxymethylglutaryl-CoA Reductase Inhibitors/therapeutic use" was done for the years 2007 to 2012 and yielded 240 results. A meta-analysis of 12 studies (Biffi, et al., 2011), comprising 2013 statin users and 9682 non-users, investigated the association between prestroke statin use and clinical outcome. A meta-analysis of 18 RCTs (Kostis WJ, et al., 2012) of statins with sex-specific outcomes (N=141,235 participants, 40,275 2omen, 21,468 cardiovascular events, i.e., coronary heart disease and stroke) demonstrated the benefit of statins in decreasing morbid and mortal cardiovascular events in apparently healthy individual and in those with clinically evident cardiovascular disease.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting the effectiveness of statin therapy on stroke outcome is moderate. There is evidence that stain therapy in both primary and secondary prevention significantly reduces subsequent major coronary events but only marginally reduces the risk of stroke recurrence. There is no clear evidence of beneficial effect from statins in those with previous hemorrhagic stroke, and it is unclear if statins should be started immediately post stroke or later (Feher, et al., 2010).

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that stroke and TIA patients should be prescribed statin therapy for stroke prevention. No position against the importance of statin therapy for secondary stroke prevention was identified in the literature.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
Statins play an important role in brain ischemia. These drugs reduce cholesterol levels, which have been related to a reduction in vascular event risk, and also have other functions besides cholesterol metabolism, called pleiotropic effects. Statins play an important role during the acute phase of ischemia, and might have neuroprotective effects, as they act in several mechanisms during the acute phase of stroke, such as nitric oxide (NO) and glutamate metabolism, inflammation, platelet aggregation, immune responses, and apoptosis. They also have other functions which can be related, with better long-term outcome, to neurorepair mechanisms. Statins promote angiogenesis, endogenous cell proliferation, neurogenesis and new synapse formation (Rodriguez-Yáñez M, et al., 2008).

The potential positive action of stains during acute cerebrovascular ischemic event are two-fold: a neuroprotective effect, limiting damage and improving recovery; and a preventative effect on early recurrence. The SPARCL trial did report a slight increase in hemorrhagic stroke (n=55) for the atorvastatin group compared to placebo (n=33). Based on a Cochrane Review of eight RCTs of statins, no patients died from ischemic stroke or from adverse drug effects, bleeding or infections among 444 participants in six studies where these outcomes were reported. Statin treatment did not reduce all-cause mortality compared with placebo or no treatment (OR 1.51, 95% CI 0.60 60 3.81) in the 431 patients enrolled in seven studies. No cases of rhabdomyolysis occurred in 274 patients enrolled in three studies.

Diet, exercise, and lifestyle modification are assumed to be cost-effective stroke prevention strategies; however, no specific studies on the cost-effectiveness of statin therapy for the prevention of stroke recurrence were noted in the literature. Most of the literature focuses on the primary prevention of cardiovascular disease. According to Chan and colleagues (2007) recent clinical trials have found that high-dose statin therapy, compared with conventional-dose statin therapy, reduces the risk of cardiovascular events in patients with acute coronary syndromes (ACS) and stable coronary artery disease (CAD). However, the actual benefit and cost-effectiveness of

high-dose statin therapy are unknown. The daily cost difference between a high- and conventional-dose statin would need to be <$1.70, $2.65, and $3.55 to yield incremental cost-effective ratios below $50,000, $100,000, and $150,000 per quality-adjusted life year (QALY).

Another study (Lazar LD, et al., 2011), evaluated the cost-effectiveness of statin therapy for primary prevention. This study utilized the Coronary Heart Disease (CHD) Policy Model, an established computer simulation, Markov state-transition model of CHD incidence, prevalence, mortality and costs in the US population >35 years of age. Cost-savings were projected for persons with LDL > 100 mg/dL and moderately high risk, LDL > 130 mg/dL and moderate risk, and LDL > 160 mg/dL and lower or lowest risk with the cost of statins at $4/month. Using this strategy, it would be possible to prevent 14,000 CHD deaths per year and save over $1.4 billion a year compared with current levels of treatment.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: National Cholesterol Education Program, Adult Treatment Panel (ATP) III (2002). During our systematic review, it was determined that the guideline developers accounted for a balanced representation of information, and provided information that was accessible and met the requirements set out in this measure maintenance form.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: The Third Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III, or ATP III) presents the National Cholesterol Education Program's (NCEP's) updated recommendations for cholesterol testing and management.
ATP III contains both evidence statements and specific recommendations based on these statements. Each evidence statement is qualified according to category of evidence (A-D) and strength of evidence (1-3), as follows:

Type of Evidence
Category and Description of Type of Evidence
A – Major randomized controlled clinical trials (RCTs)
B – Smaller RCTs and meta-analyses of other clinical trials
C – Observational and metabolic studies
D – Clinical experience

Strength of Evidence
Category and Description of Strength of Evidence
1 – Very strong evidence
2 – Moderately strong evidence
3 – Strong trend

1c.13 Grade Assigned to the Body of Evidence: A1 (Major randomized controlled clinical trials (RCTs)/Very strong evidence) // B1 (Smaller RCTs and meta-analyses of other clinical trials/Very Strong evidence)

1c.14 Summary of Controversy/Contradictory Evidence: There is some recent debate about the use of statins in women who do not have heart disease but do have high levels of cholesterol. An observational study (Culver AL, et al., 2012), involving 153,840 postmenopausal women enrolled in the Women's Health Initiative, reported a 48% greater risk of developing diabetes mellitus for women taking statin medications when compared to women not taking the medication at baseline. However, a new meta-analysis (Kostis WJ, et al., 2012) of 18 trials with 141,235 participants concluded that statin therapy was beneficial in both the primary and secondary prevention settings for both men and women.

1c.16 Quote verbatim, the specific guideline recommendation *(Including guideline # and/or page #)*:
2010 Update to the AHA/ASA Recommendations for the Prevention of Stroke in Patients with Stroke and Transient Ischemic Attack, page 233.
Class I, Level B Recommendation
Statin therapy with intensive lipid-lowering effects is recommended to reduce the risk of stroke and cardiovascular events among patients with ischemic stroke or TIA who have evidence of atherosclerosis, and LDL-c level > 100 mg/dL, and who are without known CHD.

1c.17 Clinical Practice Guideline Citation: Furie KL, Kasner SE, Adams RJ, Albers GW, et al. Guidelines for the Prevention of Stroke in Patients With Stroke or Transient Ischemic Attack. A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association. Stroke. 2011;42:232-33.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: This guideline was approved by the American Heart Association Science Advisory and Coordinating Committee on July 13, 2010. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: Other

1c.22 If other, identify and describe the grading scale with definitions: American Heart Association (AHA)/American Stroke Association (ASA)recommendation rating scale:

LEVEL A – Multiple populations evaluated.* Data derived from multiple randomized clinical trials or meta-analysis.

LEVEL B – Limited populations evaluated.* Data derived from a single randomized trial or nonrandomized studies.

LEVEL C – Very limited populations evaluated.* Only consensus opinion of experts, case studies, or standard of care.

CLASS I Benefit >>> Risk Procedure/Treatment SHOULD be performed/administered

CLASS IIa Benefit >> Risk Additional studies with focused objectives needed IT IS REASONABLE to perform procedure/administer treatment

CLASS IIb Benefit > Risk Additional studies with broad objectives needed; additional registry data would be helpful Procedure/Treatment MAY BE CONSIDERED

CLASS III Risk > Benefit Procedure/Treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL

CLASS I, LEVEL A – Recommendation that procedure or treatment is useful/effective. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS IIa, LEVEL A – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from multiple randomized trials or meta-analysis.

CLASS IIb, LEVEL A – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from multiple randomized trials or meta-analysis.

CLASS III, LEVEL A – Recommendation that procedure or treatment is not useful/effective and may be harmful. Sufficient evidence from multiple randomized trials or meta-analysis.

CLASS I, LEVEL B – Recommendation that procedure or treatment is useful/effective. Evidence from single randomized trial or nonrandomized studies.

CLASS IIa – LEVEL B – Recommendation in favor of treatment or procedure being useful/effective. Some conflicting evidence from single randomized trial or nonrandomized studies.

CLASS IIb, LEVEL B – Recommendation's usefulness/efficacy less well established. Greater conflicting evidence from single randomized trial or nonrandomized studies.

CLASS III, LEVEL B – Recommendation that procedure or treatment is not useful/effective and may be harmful. Evidence from single randomized trial or nonrandomized studies.

CLASS I, LEVEL C – Recommendation that procedure or treatment is useful/effective. Only expert opinion, case studies, or standard of care.

CLASS IIa – LEVEL C – Recommendation in favor of treatment or procedure being useful/effective. Only diverging expert opinion, case studies, or standard of care.

CLASS IIb, LEVEL C – Recommendation's usefulness/efficacy less well established. Only diverging expert opinion, case studies, or standard of care.

CLASS III, LEVEL C – Recommendation that procedure or treatment is not useful/effective and may be harmful. Only expert opinion, case studies, or standard of care.

1c.23 Grade Assigned to the Recommendation: Class I, Level of Evidence A/B

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: High 1c.26 Quality: Moderate1c.27 Consistency: High

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0439_Evidence_MSF5_0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is the fourth leading cause of death in the United States and a leading cause of serious, long-term disability, associated with significant costs. Recent guidelines recommend high-intensity statin therapy for patients with ischemic stroke unless contraindicated or patient characteristics require dosage modification.

Healthcare organizations that track this measure for internal quality improvement purposes have seen an increase in the measure rate over time. This measure has been included in the CMS Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-6 beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 979 denominator cases; 876 numerator cases; 48 hospitals; 0.89479 national aggregate rate; 0.88567 mean of hospital rates; 0.18656 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.94949 50th percentile rate/median rate; 0.85165 25th percentile rate/lower quartile; and, 0.66667 10th percentile rate.

CY 2010: 12,042 denominator cases; 11,188 numerator cases; 137 hospitals; 0.92908 national aggregate rate; 0.89366 mean of hospital rates; 0.12881 standard deviation; 1.0 90th percentile rate; 0.97059 75th percentile rate/upper quartile; 0.94231 50th percentile rate/median rate; 0.86667 25th percentile rate/lower quartile; and, 0.70647 10th percentile rate.

CY 2011: 18,608 denominator cases; 17,512 numerator cases; 157 hospitals; 0.9411 national aggregate rate; 0.90293 mean of hospital rates; 0.12829 standard deviation; 1.0 90th percentile rate; 0.97297 75th percentile rate/upper quartile; 0.94361 50th percentile rate/median rate; 0.88889 25th percentile rate/lower quartile; and, 0.78571 10th percentile rate.

CY 2012: 18,998 denominator cases; 18,165 numerator cases; 157 hospitals; 0.95615 national aggregate rate; 0.9412 mean of hospital rates; 0.08087 standard deviation; 1.0 90th percentile rate; 0.99371 75th percentile rate/upper quartile; 0.96825 50th percentile rate/median rate; 0.925 25th percentile rate/lower quartile; and, 0.84375 10th percentile rate.

CY 2013: 29,350 denominator cases; 28,374 numerator cases; 262 hospitals; 0.96675 national aggregate rate; 0.9469 mean of hospital rates; 0.09876 standard deviation; 1.0 90th percentile rate; 0.99649 75th percentile rate/upper quartile; 0.97938 50th percentile rate/median rate; 0.94444 25th percentile rate/lower quartile; and, 0.86585 10th percentile rate.

CY 2014: 140,296 denominator cases; 136,545 numerator cases; 1296 hospitals; 0.97326 national aggregate rate; 0.95761 mean of hospital rates; 0.08458 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98507 50th percentile rate/median rate; 0.95303 25th percentile rate/lower quartile; and, 0.89474 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not applicable

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REasons for Geographic and Racial Differences in Stroke (REGARDS) cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038): and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years of age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age : RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer,et al., 2010).

In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Differences in access to and use of stroke prevention therapies in all racial and ethnic groups has been poorly documented and understudied; however, one study of 5840 stroke survivors as part of the National Health Interview Survey, found that women, blacks or African Americans, and the poor were significantly less likely to fill prescriptions because of costs. Disparities are reduced when patients have health insurance and ready access to care.

According to the literature, minorities are less likely to receive medications for secondary prevention, including statin therapy for hyperlipidemia (Cruz-Flores, et al., 2011). Yood and colleagues (2006) found that blacks or African Americans newly diagnosed with dyslipidemia and prescribed statins were 36% less likely to achieve low-density lipoprotein goals over time (hazard ratio 0.64, 95% CI O.61 to 0.68). This disparity persisted after low-density lipoprotein testing and adjustment for statin adherence (hazard ratio 0.60, 95% CI 0.57 to 0.63). Another study by Mark and associates (2007) noted that blacks or African Americans were less likely than whites to be switched between lipid-lowering agents (OR 0.68 95% CI 0.60 to 0.78), to have treatment adjusted (OR 0.53, 95% CI 0.43 to 0.66), or to be prescribed higher medication dosages (OR 0.75, 95% CI 0.67 to 0.84).

Since the last endorsement date, Schwamm and colleagues (2010) found that black patients with stroke received fewer evidence-based care processes than Hispanic or white patients. Lipid-lowering therapy at discharge for patients with low-density lipoprotein (LDL) > 100, or those on lipid-lowering agents before hospital admission, or in whom LDL was not measured in the past 30 days, was one care process evaluated in this study. Blacks had lower odds relative to white patients of receiving lipid therapy at discharge after adjustment for both patient and hospital level variables: OR 0.91 [95% CI 0.88-0.96]

A more recently published study (Qian F, et al, 2013) from GWTG also noted statistically significant (P<0.01) racial and ethnic disparities for lipid-lowering therapy at discharge. Using patient data (n=200,900) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, the following performance measure rates were reported for lipid-lowering medication prescribed at discharged : non-Hispanic White (n=170,694) 84.3%; non-Hispanic Black (n=20,514) 83.8%; Hispanic (n=6632) 85.8%; and non-Hispanic Asian American (n=3060) 86.7%.

2014 data from the Paul Coverdell National Acute Stroke Registry (PCNASR) reported greater disparity for women (95.9%) compared to men (97.0%) prescribed statin therapy at discharge. Similar rates of statin therapy prescribed at discharge were reported for white patients (96.3%) and other races (96.7%); aggregate rate 96.4%; n=45,249 (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).

1c. High Priority (previously referred to as High Impact)

The measure addresses:

- a specific national health goal/priority identified by DHHS or the National Priorities Partnership convened by NQF; OR
- a demonstrated high-priority (high-impact) aspect of healthcare (e.g., affects large numbers of patients and/or has a substantial impact for a smaller population; leading cause of morbidity/mortality; high resource use (current and/or future); severity of illness; and severity of patient/societal consequences of poor quality).

1c.1. Demonstrated high priority aspect of healthcare

Affects large numbers, A leading cause of morbidity/mortality, Severity of illness

1c.2. If Other:

1c.3. Provide epidemiologic or resource use data that demonstrates the measure addresses a high priority aspect of healthcare. List citations in 1c.4.

Stroke ranks as the number four cause of death in the United States, following diseases of the heart, cancer, and chronic lung-related diseases. Each year, ˜ 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent strokes. These numbers equate to one stroke victim every 40 seconds on average. From 2001 to 2011, the relative rate of stroke death fell by 35.1% and the actual number of stroke deaths declined by 21.2%.; however, one of every 20 deaths in the United States remains attributable to stroke. More women than men die of stroke each year. Women accounted for almost 60% of US stroke deaths in 2008 (Mozaffarian D, et al., 2015).

Stroke is also a leading cause of long-term disability (George M, et al., 2009). Stroke was among the top 18 diseases contributing to years lived with disability in 2010; of these 18 causes, only the age-standardized rates for stroke increased significantly between 1990 and 2010 ($P<0.05$). (US Burden of Disease Collaborators, 2013) . Among Medicare patients discharged from the hospital after stroke, ˜45% return directly home, 24% are discharged to inpatient rehabilitation facilities, and 31% are discharged to skilled nursing facilities. Of stroke patients returning directly home, 32% use home healthcare services. In 2011, the direct and indirect cost of stroke was $33.6 billion (Mozaffarian D, et al., 2015).

According to the Third Report of the National Cholesterol Education Program (NCEP) Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III/ATP III) (National Institutes of Health, 2002), statins should be considered as first-line drugs when LDL-lowering drugs are indicated to achieve LDL treatment goals. HMG CoA reductase inhibitors (statins) are powerful LDL-lowering drugs. Statin therapy reduces the risk of acute coronary syndromes, coronary procedures, and other coronary outcomes in both primary and secondary prevention. It also reduces the risk of stroke in secondary prevention.

The Stroke Prevention by Aggressive Reduction of Cholesterol Levels (SPARCL) trial (Amarenco, P, et al., 2006) concluded that in patients with recent stroke or TIA and without known coronary heart disease, 80 mg of atorvastatin per day reduced the overall incidence of strokes and cardiovascular events, despite a small incidence of hemorrhagic stroke. The trial randomly assigned 4731 patients who had had a stroke or TIA within one to six months before study entry, had low-density lipoprotein (LDL) cholesterol levels of 100 to 190 mg per deciliter (2.6 to 4.9 mmol per liter), and had no known coronary heart disease to double-blind treatment with 80 mg of atorvastatin per day or placebo. The primary end point was a first nonfatal or fatal stroke. The mean LDL cholestrerol level during the trial was 73 mg per deciliter (1.9 mmol per liter) among patients receiving atorvastatin and 129 mg per deciliter (3.3 mmol per liter) among patients receiving placebo. During a median follow-up of 4.9 years, 265 patients (11.2 percent) receiving atorvastatin and 311 patients (13.1 percent) receiving placebo had a fatal or nonfatal stroke (5-year absolute reduction in risk, 2.2 percent; adjusted hazard ratio, 0.84; 95 percent confidence interval, 0.71 to 0.99; P=0.03; unadjusted P=0.05) The atorvastatin group had 218 ischemic strokes and 55 hemorrhagic strokes. The five-year absolute reduction in the risk of major cardiovascular events was 3.5 percent (hazard ratio, 0.80; 95 percent confidence interval, 0.69 to 0.92; P=0.002). The overall mortality rate was similar, with 216 deaths in the atorvastatin group and 211 deaths in the placebo group (P=0.98), as were the rates of serious adverse events. Elevated liver enzyme values were more common in patients taking atorvastatin.

In 2013, the American College of Cardiology (ACC) / American Heart Association (AHA) updated the Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults, and strongly recommended high-intensity statin therapy for secondary prevention in patients with clinical atherosclerotic cardiovascular disease (ASCVD), unless contraindicated. Patients with ischemic stroke due to atherosclerosis are included in this first of four statin benefit groups. High-intensity statin therapy should be initiated or continued as first-line therapy in both women and men =75 years. When high-intensity statin therapy is contraindicated or for those patients unable to tolerate high-intensity statin therapy, moderate-intensity statin therapy should be used as a second option. High-intensity therapy may also be reasonable for ischemic stroke patients > 75 years, if risk-reduction benefits outweigh the risk of adverse events and the patient can tolerate it (Stone NJ, et al, 2013). AHA/ASA Guidelines for the Prevention of Stroke in Patients with Stroke or Transient Ischemic Attack (Kernan WN, et al, 2014) were revised the following year to align with 2013 ACC/AHA recommendations. Statin therapy was recommended to reduce the risk of stroke and cardiovascular events for patients with ischemic stroke or TIA presumed to be of atherosclerotic origin and LDL > 100 with or without evidence for other ASCVD, as well as, patients with LDL < 100 and no evidence for other clinical ASCVD.

1c.5. **If a PRO-PM (e.g. HRQoL/functional status, symptom/burden, experience with care, health-related behaviors), provide evidence that the target population values the measured PRO and finds it meaningful.** *(Describe how and from whom their input was obtained.)*
Not applicable.

2. Reliability and Validity—Scientific Acceptability of Measure Properties

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ***Measures must be judged to meet the subcriteria for both reliability and validity to pass this criterion and be evaluated against the remaining criteria.***

2a.1. Specifications The measure is well defined and precisely specified so it can be implemented consistently within and across organizations and allows for comparability. eMeasures should be specified in the Health Quality Measures Format (HQMF) and the Quality Data Model (QDM).

De.5. **Subject/Topic Area** *(check all the areas that apply):*
Neurology : Stroke/Transient Ischemic Attack (TIA)

De.6. **Cross Cutting Areas** *(check all the areas that apply):*
Prevention, Safety : Complications

S.1. **Measure-specific Web Page** *(Provide a URL link to a web page specific for this measure that contains current detailed specifications including code lists, risk model details, and supplemental materials. Do not enter a URL linking to a home page or to general information.)*
http://www.jointcommission.org/specifications_manual_for_national_hospital_inpatient_quality_measures.aspx

S.2a. **If this is an eMeasure**, HQMF specifications must be attached. Attach the zipped output from the eMeasure authoring tool (MAT) - if the MAT was not used, contact staff. (Use the specification fields in this online form for the plain-language description of the specifications)
This is not an eMeasure **Attachment:**

S.2b. **Data Dictionary, Code Table, or Value Sets** *(and risk model codes and coefficients when applicable) must be attached. (Excel or csv file in the suggested format preferred - if not, contact staff)*
Attachment **Attachment:** Appendix_A.1-635878758534627046.xls

S.3. **For endorsement maintenance**, please briefly describe any changes to the measure specifications since last endorsement date and explain the reasons.
Since the last endorsement date, the measure specifications have been revised to align with current guideline recommendations from the American College of Cardiology (ACC) / American Heart Association (AHA) for the management of blood cholesterol in adults (Stone, et al, 2013). The 2013 guidelines recognize four statin benefit groups. Patients with ischemic stroke are included in the first statin benefit group along with other patients who have clinical atherosclerotic cardiovascular disease (ASCVD). For these patients, age 75 years or younger, high-intensity statin therapy is recommended unless contraindicated or patient characteristics predispose to adverse effects. The rationale for the measure was revised to reflect these recommendations, emphasizing that statin therapy is indicated for those ischemic stroke patients with evidence of atherosclerosis, i.e., "individuals with ischemic stroke due to large artery atherosclerosis, individuals with ischemic stroke due to intrinsic small vessel disease, and individuals with ischemic stroke not directly due to atherosclerosis but with clinically evident atherosclerotic disease in an uninvolved cerebral or noncerebral bed". The denominator statement was revised to ischemic stroke patients, and the denominator inclusions for patients with LDL greater than or equal to 100 mg/dL, or LDL not measured, or who were on a lipid-lowering medication prior to hospital arrival removed, since they are no longer relevant to current guideline recommendations. Additionally, the data elements that captured these three denominator inclusions were removed from the measure algorithm. Appendix C, Table 1.6 Lipid-Lowering Medications used for abstraction of the data element Pre-Arrival Lipid-Lowering Agent was also removed.

All ICD-9-CM diagnosis codes and ICD-9-CM procedure codes were converted to ICD-10-CM diagnosis and ICD-10-PCS procedure codes throughout the measure specifications. The Department of Health and Human Services (HHS) mandated that all entities covered by the Health Insurance Portability and Accountability Act (HIPAA) must transition to a new set of codes for electronic health care transactions on October 1, 2015.

S.4. **Numerator Statement** *(Brief, narrative description of the measure focus or what is being measured about the target population, i.e., cases from the target population with the target process, condition, event, or outcome)*
IF an OUTCOME MEASURE, state the outcome being measured. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
Ischemic stroke patients prescribed statin medication at hospital discharge

S.5. **Time Period for Data** *(What is the time period in which data will be aggregated for the measure, e.g., 12 mo, 3 years, look back to August for flu vaccination? Note if there are different time periods for the numerator and denominator.)*
Episode of care

S.6. **Numerator Details** *(All information required to identify and calculate the cases from the target population with the target process, condition, event, or outcome such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
IF an OUTCOME MEASURE, describe how the observed outcome is identified/counted. Calculation of the risk-adjusted outcome should be described in the calculation algorithm.
One data element is used to calculate the numerator:
• Statin Medication Prescribed at Discharge – Documentation that a statin medication was prescribed at hospital discharge. Allowable values: Yes, No/UTD or unable to determine from medical record documentation.

Patients are eligible for the numerator population when the allowable value equals "yes" for the data element.

S.7. **Denominator Statement** *(Brief, narrative description of the target population being measured)*
Ischemic stroke patients

S.8. **Target Population Category** *(Check all the populations for which the measure is specified and tested if any):*
Senior Care

S.9. **Denominator Details** *(All information required to identify and calculate the target population/denominator such as definitions, specific data collection items/responses , code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*
Nine data elements are used to calculate the denominator:

1. Admission Date – The month, day and year of admission to acute inpatient care.
2. Birthdate - The month, day and year the patient was born.
3. Clinical Trial - Documentation that during this hospital stay the patient was enrolled in a clinical trial in which patients with stroke were being studied. Allowable values: Yes or No/UTD.
4. Comfort Measures Only – The earliest day the physician/APN/PA documented comfort measures only after hospital arrival. Allowable values: 1 (Day 0 or 1); 2 (Day 2 or after); 3 (Timing Unclear); 4 (Not Documented/UTD).
5. Discharge Date – The month day and year the patient was discharged from acute care, left against medical advice or expired during the stay.
6. Discharge Disposition – The place or setting to which the patient was discharged on the day of hospital discharge.
7. Elective Carotid Intervention – Documentation demonstrates that the current admission is solely for the performance of an elective carotid intervention (e.g., elective carotid endarterectomy, angioplasty, carotid stenting).
Allowable values: Yes or No/UTD.
8. ICD-10-CM Principal Diagnosis Code - The International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) code associated with the diagnosis established after study to be chiefly responsible for occasioning the admission of the patient for this hospitalization.
9. Reason For Not Prescribing Statin Medication at Discharge – Documentation of a reason for not prescribing a statin medication at discharge.
Allowable values: Yes or No/UTD.

Population: Discharges with ICD-10-CM Principal Diagnosis Code for ischemic stroke as defined in Appendix A, Table 8.1.

S.10. **Denominator Exclusions** *(Brief narrative description of exclusions from the target population)*
- Less than 18 years of age
- Length of Stay > 120 days
- Comfort measures only documented
- Enrolled in clinical trials related to stroke
- Admitted for elective carotid intervention
- Discharged to another hospital
- Left against medical advice
- Expired

- Discharged to home for hospice care
- Discharged to a health care facility for hospice care
- Documented reason for not prescribing statin medication at discharge

S.11. **Denominator Exclusion Details** *(All information required to identify and calculate exclusions from the denominator such as definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format at S.2b)*

• The patient age in years is equal to the Discharge Date minus the Birthdate. Patients less than 18 years are excluded.
• The Length of Stay (LOS) in days is equal to the Discharge Date minus the Admission Date. If the LOS is greater than 120 days, the patient is excluded.
• Patients with Comfort Measures Only allowable value of 1 (Day 0 or 1), 2 (Day 2 or after), and 3 (Timing unclear) are excluded.
• Patients are excluded if "Yes" is selected for Clinical Trial.
• Patients with ICD-10-PCS procedure codes for carotid intervention procedures as identified in Appendix A, Table 8.3,, if medical record documentation states that the patient was admitted for the elective performance of this procedure are excluded.
• Patients with Discharge Disposition allowable value of 2 (Hospice-Home), 3 (Hospice-Health Care Facility), 4 (Acute Care Facility), 6 (Expired), or 7 (Left Against Medical Advice/AMA) are excluded.
• Patients are excluded if "Yes" is selected for Reason For Not Prescribing Statin Medication at Discharge.

S.12. **Stratification Details/Variables** *(All information required to stratify the measure results including the stratification variables, definitions, specific data collection items/responses, code/value sets – Note: lists of individual codes with descriptors that exceed 1 page should be provided in an Excel or csv file in required format with at S.2b)*

Not applicable, the measure is not stratified.

S.13. **Risk Adjustment Type** (Select type. Provide specifications for risk stratification in S.12 and for statistical model in S.14-15)

No risk adjustment or risk stratification

If other:

S.14. **Identify the statistical risk model method and variables** *(Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development and testing should be addressed with measure testing under Scientific Acceptability)*

Not applicable.

S.15. **Detailed risk model specifications** *(must be in attached data dictionary/code list Excel or csv file. Also indicate if available at measure-specific URL identified in S.1.)*

Note: Risk model details (including coefficients, equations, codes with descriptors, definitions), should be provided on a separate worksheet in the suggested format in the Excel or csv file with data dictionary/code lists at S.2b.

S.15a. **Detailed risk model specifications** (*if not provided in excel or csv file at S.2b*)

Not applicable.

S.16. **Type of score:**

Rate/proportion

If other:

S.17. **Interpretation of Score** *(Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score)*

Better quality = Higher score

S.18. **Calculation Algorithm/Measure Logic** *(Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.)*

1. Start processing. Run cases that are included in the Stroke (STK) Initial Patient Population and pass the edits defined in the Transmission Data Processing Flow: Clinical through this measure.

2. Check ICD-10-CM Principal Diagnosis Code

a. If the ICD-10-CM Principal Diagnosis Code is not on Table 8.1, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.

b. If the ICD-10-CM Principal Diagnosis Code is on Table 8.1, continue processing and proceed to Discharge Disposition.

3. Check Discharge Disposition
a. If Discharge Disposition equals 2, 3, 4, 6, 7 the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
b. If Discharge Disposition equals 1, 5, 8, continue processing and proceed to Comfort Measures Only.

4. Check Comfort Measures Only
a. If Comfort Measures Only is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Comfort Measures Only equals 1, 2, or 3, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Comfort Measures Only equals 4, continue processing and proceed to Clinical Trial.

5. Check Clinical Trial
a. If Clinical Trial is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Clinical Trial equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the measure population. Stop processing.
c. If Clinical Trial equals No, continue processing and proceed to Elective Carotid Intervention.

6. Check admitted for Elective Carotid Intervention
a. If Elective Carotid Intervention is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Elective Carotid Intervention equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Elective Carotid Intervention equals No, continue processing and proceed to Pre-Arrival Lipid-Lowering Agent.

7. Check Statin Medication Prescribed at Discharge
a. If Statin Medication Prescribed at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Statin Medication Prescribed at Discharge equals Yes, the case will proceed to a Measure Category Assignment of E and will be in the Numerator Population. Stop processing.
c. If Statin Medication Prescribed at Discharge equals No, continue processing and check Reason for Not Prescribing Statin Medication at Discharge.

8. Check Reason for Not Prescribing Statin Medication at Discharge
a. If Reason for Not Prescribing Statin Medication at Discharge is missing, the case will proceed to a Measure Category Assignment of X and will be rejected. Stop processing.
b. If Reason for Not Prescribing Statin Medication at Discharge equals Yes, the case will proceed to a Measure Category Assignment of B and will not be in the Measure Population. Stop processing.
c. If Reason for Not Prescribing Statin Medication at Discharge equals No, the case will proceed to a Measure Category Assignment of D and will be in the Measure Population. Stop processing.

S.19. Calculation Algorithm/Measure Logic Diagram URL or Attachment *(You also may provide a diagram of the Calculation Algorithm/Measure Logic described above at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
Available at measure-specific web page URL identified in S.1

S.20. Sampling *(If measure is based on a sample, provide instructions for obtaining the sample and guidance on minimum sample size.)*
IF a PRO-PM, identify whether (and how) proxy responses are allowed.
Hospitals that choose to sample have the option of sampling quarterly or sampling monthly. A hospital may choose to use a larger sample size than is required. Hospitals whose Initial Patient Population size is less than the minimum number of cases per quarter for the measure set cannot sample.

Regardless of the option used, hospital samples must be monitored to ensure that sampling procedures consistently produce statistically valid and useful data. Due to exclusions, hospitals selecting sample cases MUST submit AT LEAST the minimum required sample size.

Quarterly Sampling
The Quarterly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing quarterly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N" >/= 900, then "n" 180
If "N" 226-899, then "n" 20% of Initial Patient Population size
If "N" 45-225, then "n" 45
If "N" 6-44, No sampling; 100% Initial Patient Population required
If "N" 0-5, Submission of patient level data is not required; if submission occurs, 100% Initial Patient Population required

Monthly Sampling
The Monthly Sample Size "n", i.e., Minimum Required Sample Size, is based on the Initial Patient Population Size "N" for the STK Measure Set. Hospitals performing monthly sampling for STK must ensure that their Initial Patient Population and sample sizes meet the following conditions:
If "N >/= 300, then "n" 60
If "N 76-299, then "n" 20% of Initial Patient Population size
If "N 15-75, then "n" 15
If "N < 15, No sampling; 100% Initial Patient Population required

S.21. **Survey/Patient-reported data** *(If measure is based on a survey, provide instructions for conducting the survey and guidance on minimum response rate.)*
IF a PRO-PM, specify calculation of response rates to be reported with performance measure results.
Not applicable. This measure is not based on a survey or a PRO-PM.

S.22. **Missing data** (specify how missing data are handled, e.g., imputation, delete case.)
Required for Composites and PRO-PMs.
Any file with missing data will result in a measure category assignment of X and rejection of the file from the warehouse, unless the data are not used to process the measure. If the data are used to process the measure and have been reported by the abstractor as No/UTD, the case will result in a measure category assignment of D (i.e., failed measure, not rejected).

S.23. **Data Source** *(Check ONLY the sources for which the measure is SPECIFIED AND TESTED).*
If other, please describe in S.24.
Electronic Clinical Data, Paper Medical Records

S.24. **Data Source or Collection Instrument** *(Identify the specific data source/data collection instrument e.g. name of database, clinical registry, collection instrument, etc.)*
IF a PRO-PM, identify the specific PROM(s); and standard methods, modes, and languages of administration.
Each data element in the data dictionary includes suggested data sources. The data are collected using contracted Performance Measurement Systems (vendors) that develop data collection tools based on the measure specifications. The tools are verified and tested by Joint Commission staff to confirm the accuracy and conformance of the data collection tool with the measure specifications. The vendor may not offer the measure set to hospitals until verification has been passed.

S.25. **Data Source or Collection Instrument** *(available at measure-specific Web page URL identified in S.1 OR in attached appendix at A.1)*
No data collection instrument provided

S.26. **Level of Analysis** *(Check ONLY the levels of analysis for which the measure is SPECIFIED AND TESTED)*
Facility, Population : National

S.27. **Care Setting** *(Check ONLY the settings for which the measure is SPECIFIED AND TESTED)*
Hospital/Acute Care Facility
If other:

S.28. **COMPOSITE Performance Measure** - Additional Specifications *(Use this section as needed for aggregation and weighting rules, or calculation of individual performance measures if not individually endorsed.)*
Not applicable

2a. Reliability – See attached Measure Testing Submission Form
2b. Validity – See attached Measure Testing Submission Form
0439_MeasureTesting_MSF5.0_Data-635905388861973443.doc

NQF #: 0439 NQF Project: Neurology Project

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. (evaluation criteria)
Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See guidance on measure testing.

2a2. Reliability Testing. (*Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.*)

2a2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on this measure are as follows:
170 health care organizations representing various hospital demographics:
17 For Profit; 144 Not for Profit; 9 Government
62 >=300 beds; 71 100-299 beds; 37 <100 beds
142 Urban; 28 Rural
22 Teaching; 148 Non-teaching

States represented in this data collection effort include: AL, AR, AZ, CA, CT, FL, GA, IA, ID, IL, IN, KY, LA, MA, MD, MI, MN, MO, MS, NC, NE, NJ, NM, NY, OH, PA, PR, SC, SD, TN, TX, VA, WA, WI

15 performance measurement systems are used for data transmission to The Joint Commission.

2a2.2 Analytic Method *(Describe method of reliability testing & rationale)*:
At the time this measure was originally tested, extensive tests of measure reliability were conducted. Pilot testing of this measure was conducted in 2004-2005 and consisted of a twelve month data collection period using a retrospective approach with data transmission. To assess reliability, data were re-abstracted retrospectively by Joint Commission staff from a randomly selected sample of patient records over the 12 month period. Results of re-abstraction were compared with original abstraction results in order to determine the rate of agreement. The objectives of pilot testing were to evaluate reliability of individual data elements, assess data collection effort and identify potential measure enhancements.

This measure was re-tested in 2010-2011 (n=33), following modification of the measure to focus specifically on statin medications (as opposed to the more general designation of lipid lowering medications, as had been originally tested). Retrospective comparison of vendor re-abstracted data and data submitted to The Joint Commission warehouse by the healthcare organization revealed zero defects. The agreement rate was 100% for all STK-6 Discharged on Statin Medication data elements.

Currently, hospitals are supported in their data collection and reporting efforts by 15 contracted performance measurement system (PMS) vendors. It is a contractual requirement of Joint Commission listed vendors that the quality and reliability of data submitted to them by contracted health care organizations must be monitored on a quarterly basis. In addition, The Joint Commission analyzes these data by running 17 quality tests on the data submitted into ORYX. (ORYX is the term used by The Joint Commission to describe the component of the hospital accreditation program which requires data collection and reporting on standardized national performance measures). The following is a list of the major tests done on the submitted ORYX data:

- Transmission of complete data

- Usage of data received: To understand if the HCO provides the relevant service to treat the relevant population
- Investigation of aberrant data points
- Verification of patient population and sample size
- Identification of missing data elements
- Validation of the accuracy of target outliers
- Data integrity
- Data corrections

Data Element Agreement Rate:
Inter-rater reliability testing methodology utilized by contracted performance measure system vendors as outlined in the contract is as follows:

- All clinical data elements and all editable demographic elements are scored.
- All measure data are reabstracted with originally abstracted data having been blinded so that the reabstraction is not biased.
- Reabstracted data are compared with originally abstracted data on a data element by data element basis. A data element agreement rate is calculated. Clinical and demographic data are scored separately, and an overall agreement rate is computed.

2a2.3 Testing Results *(Reliability statistics, assessment of adequacy in the context of norms for the test conducted)*:
Data element agreement rates reported to The Joint Commission for the time period of one year (4Q2010 – 3Q2011) have shown an overall agreement rate of 96.7%. This reflects the findings of 77 hospitals, comprising 739 records. The following table delineates calculated agreement rates for individual data elements that are used to compute measure rates for STK-6.

Data Elements	Total 'n' numerator	Total 'n' denominator	Rate
Clinical Trial	712	714	99.7%
Comfort Measures Only	709	714	99.3%
Elective Carotid Intervention	711	714	99.6%
LDL-c Greater Than or Equal to 100 mg/dL	363	380	95.5%
LDL-c Measured Within the First 48 Hours or 30 Days Prior to Hospital Arrival	434	463	93.7%
Pre-Arrival Lipid-Lowering Agent	426	464	91.8%
Reason for Not Prescribing Statin Medication at Discharge	91	99	92.0%
Statin Medication Prescribed at Discharge	416	441	94.3%

These agreement rates are considered to be well within acceptable levels.

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H☐ M☐ L☐ I ☐

2b1.1 Describe how the measure specifications *(measure focus, target population, and exclusions)* are consistent with the evidence cited in support of the measure focus (*criterion 1c)* and identify any differences from the evidence:
This measure focuses on determining the proportion of ischemic stroke patients with LDL greater than or equal to 100 mg/dL, or LDL not measured, or who were on a lipid-lowering medication prior to hospital arrival that are prescribed a statin medication at hospital discharge. The literature supports the effectiveness of statin medications for reducing serum levels of low-density lipoprotein (LDL) cholesterol circulating in the blood. Statins are a class of pharmaceutical agents that modify LDL cholesterol by blocking the action of the liver enzyme needed to synthesize cholesterol. Elevated LDL is associated with increased risk offatty plaque build-up in the walls of arteries which can result in decreased blood flow to the brain and stroke.

Statin medications are the first-line drugs of choice for reducing LDL for ischemic stroke patients with LDL levels greater than or equal to 100 mg/dL as recommended in AHA clinical practice guidelines. Randomized clinical trials (i.e., Stroke Prevention by Aggressive Reduction in Cholesterol Levels – "SPARCL" and Heart Protection Study – "HPS") support the use of statins in patients with large artery atherosclerotic or small artery branch atherosclerotic (lacunar) stroke. These trials convincingly demonstrated that intensive lipid-lowering therapy using statin medication was associated with a dramatic reduction in the rate of recurrent ischemic stroke and major coronary events. There is no published evidence to recommend the routine use of statins in the treatment of stroke patients who do not have atherosclerosis and do not otherwise qualify for lipid lowering due to other conditions.

Patients less than 18 years of age that have a length of stay (LOS) more than 120 days, enrolled in a clinical trial for stroke or who were designated "comfort measures only" anytime during hospitalization are excluded. In addition, patients who were discharged to a health care facility for hospice care, home for hospice care, who expired or who left against medical advice are excluded to harmonize with other CMS/Joint Commission measures.

Operationally, there are two differences between the measure specifications and guideline recommendations. First, patients with a planned admission to the hospital for an elective carotid intervention which restores blood flow to the brain and prevents stroke, such as carotid endarterectomy or carotid stenting, are excluded from the measure. Second, patients with a contraindication to statin therapy or a documented reason why statin therapy is not indicated are excluded from the measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.)*

2b2.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b2.2 Analytic Method *(Describe method of validity testing and rationale; if face validity, describe systematic assessment)*:
At the time this measure was originally tested measure validity was assessed via survey and focus groups of hospitals participating in the pilot test. All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant.

Since the measure has been in national use, continued validity of the measure has been determined through analysis of feedback from measure users. The Joint Commission provides a web-based application with which measure users can provide feedback regarding appropriateness of measure specifications, request clarification of specifications, and/or provide other comments pertinent to the measure. This feedback is systematically, continually, reviewed in order to identify trends and to identify areas of the measure specifications that require clarification or revision. Additionally, Joint Commission staff continually monitors the national literature and environment in order to assess continued validity of this measure. An expert technical advisory panel (TAP) meets on a quarterly basis in order to assess continued validity of this measure. And finally, the conversion from ICD-9-CM diagnosis codes to ICD-10-CM diagnosis codes has been completed and reviewed by the Technical Advisory Panel for validity. The panel has determined that the intent of the measure has not changed as a result of the conversion. The crosswalk will also be posted in a future version of the specifications manual for public comment, and results of feedback will be reviewed and incorporated into the measure specifications where indicated.

2b2.3 Testing Results *(Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment)*:
Analysis of feedback obtained via our automated feedback system reveals 37 submissions regarding specifications for this measure over the past year. Questions regarding clarification of the data element Reason for Not Prescribing Statin Medication at Discharge are most common, specifically reasons that are inferred in the absence of documented linkage with statins, e.g., reduction in LDL-c attained with a pre-arrival lipid-lowering agent other than a statin medication.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
As noted previously, this measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b3.2 Analytic Method (*Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference)*:
Measure exclusions that were not derived directly from the evidence are presented below. Please note that these are population exclusions that are necessary to ensure consistency in all measures in this 8 measure set.

These exclusions were analyzed for frequency of occurrence. An issue that is of great concern to users of this measure is that due to the presence of exceptions to the measure, attainment of a 100% measure rate is not possible. Because of the role of this measure in

the current Joint Commission accreditation process this is especially troubling to measure users. This concern is the basis for a number of the non-evidence-based exclusions to these measures. The following measure exclusions that were not derived directly from the evidence are as follows:

1. Patients < 18 years old
2. Patients who have a length of stay (LOS) greater than 120 days
3. Patients with Comfort Measures Only documented
4. Patients enrolled in clinical trials
5. Patients admitted for Elective Carotid Intervention
6. Patients discharged to another hospital (acute care facility)
7. Patients who left against medical advice
8. Patients who expired
9. Patients discharged to home for hospice care
10. Patients discharged to a health care facility for hospice care
11. Patients with a documented Reason For Not Prescribing Statin Medication at Discharge

2b3.3 Results *(Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):*
N=39,812

1. Patients < 18 years old = 0%
2. Patients who have a length of stay (LOS) greater than 120 days = 0%
3. Patients with Comfort Measures Only documented = 11.11%
4. Patients enrolled in clinical trials =0.39%
5. Patients admitted for Elective Carotid Intervention = 9.96%
6. Patients discharged to another hospital (acute care facility) = 1.13%
7. Patients who left against medical advice = 0.25%
8. Patients who expired = 3.58%
9. Patients discharged to home for hospice care = 0.60%
10. Patients discharged to a health care facility for hospice care = 1.52%
11. Patients with a documented Reason For Not Prescribing Statin Medication at Discharge = 2.58%

2b4. Risk Adjustment Strategy. (*For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.*)

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Not Applicable

2b4.2 Analytic Method (*Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables)*:
Not Applicable

2b4.3 Testing Results *(Statistical risk model: Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. Risk stratification: Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata)*:
Not Applicable

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment:
Not Applicable

2b5. Identification of Meaningful Differences in Performance. (*The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.*)

2b5.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
This measure has been in national use since the 4th quarter of 2009. Demographics of organizations collecting and reporting data on these measures are as previously reported.

2b5.2 Analytic Method *(Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance)*:
The method used to analyze meaningful differences in performance at The Joint Commission is Target Analysis. The object of target analysis is to compare a health care organization's data against a comparative norm for the purpose of evaluating performance improvement opportunities. When an organization's performance level is statistically significantly different from a comparative norm, it is considered a statistical deviation. A statistical deviation may be desirable or undesirable depending on the "direction of improvement" of the measure.

There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations.

2b5.3 Results *(Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance)*:
STK-6 Distribution of Measure Results

Quarter	#hospitals	Mean	SD	90th%	75th%	50th%	25th%	10th Percentile
3Q2011	152	0.92074	0.14322	1	1	0.96214	0.9	0.82353
2Q2011	155	0.90883	0.16942	1	1	0.95833	0.9125	0.77778
1Q2011	159	0.87312	0.18575	1	1	0.9375	0.84615	0.6
4Q2010	136	0.87766	0.17491	1	0.98626	0.93333	0.83667	0.69231
3Q2010	126	0.89971	0.17615	1	1	0.96	0.9	0.7
2Q2010	117	0.90979	0.15111	1	1	0.96667	0.88889	0.72727
1Q2010	97	0.9034	0.15012	1	1	0.95652	0.875	0.67273
4Q2009	48	0.88567	0.18656	1	1	0.94949	0.85165	0.66667

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample *(Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included)*:
Multiple data sources are not used for this measure.

2b6.2 Analytic Method *(Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure)*:
Not applicable

2b6.3 Testing Results *(Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted)*:
Not applicable

2c. Disparities in Care: H☐ M☐ L☐ I ☐ NA☐ (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results *(Scores by stratified categories/cohorts)*: The measure is not stratified for disparities.

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please explain:
Although some evidence exists that minorities receive statin therapy less frequently and aggressively than non-Hispanic whites, currently there are no plans to stratify the measure. The Joint Commission does not currently capture gender-specific data, or data elements for race or ethnicity because these data elements have not been shown to be reliably collectable due to the fact that no national standardized definitions exist for these data elements. Also, not all hospitals collect race and ethnicity. In the future, it may be feasible for The Joint Commission to explore how race and ethnicity and other relevant disparity data, might be collected reliably.

2.1-2.3 Supplemental Testing Methodology Information:

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met? (*Reliability and Validity must be rated moderate or high*) Yes☐ No☐ Provide rationale based on specific subcriteria:
If the Committee votes No, STOP

NEW (since 2012 endorsement): Data for Empirical Testing

NATIONAL QUALITY FORUM—Measure Testing (subcriteria 2a2, 2b2-2b6)

2b2. VALIDITY TESTING
2b2.1. What level of validity testing was conducted? (*may be one or both levels*)
☐ **Critical data elements** (*data element validity must address ALL critical data elements*)
☐ **Performance measure score**
☐ **Empirical validity testing**
☐ **Systematic assessment of face validity of performance measure score as an indicator** of quality or resource use (*i.e., is an accurate reflection of performance on quality or resource use and can distinguish good from poor performance*)

2b2.2. For each level checked above, describe the method of validity testing and what it tests (*describe the steps—do not just name a method; what was tested, e.g., accuracy of data elements compared to authoritative source, relationship to another measure as expected; what statistical analysis was used)*

The data used to measure validity consists of one year data (third, and fourth quarter 2014 and first and second quarter for 2015) extracted from The Joint Commission warehouse. The hospitals selection was based to those hospitals that reported 12 months of data and had 30 or more denominator cases for the year.

Measure convergent and criterion validity was assessed using hospitals patient level data from The Joint commission warehouse. Measure specifications, including population identification, numerator and denominator statements, exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant in previous face validity testing. The patient population was comprised of all patients discharged with an ICD-9-CM Principal Diagnosis Code for stroke as defined in Appendix A, Table 8.1 or Table 8.2.

Conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications. The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were published in early 2015, well in advance of the mandated date of October 1, 2015.

We conducted a secondary analysis to help interpret results; correlation with other stroke process measures.

2b2.3. What were the statistical results from validity testing? (*e.g., correlation; t-test*)

Descriptive statistics for the STK measures:
N=1,318 hospitals
n= 2, 206,379 patients records

STK-6

Median: 100%
Percentile 10%: 92%
Percentile 25%: 96%
Percentile 75%: 100%
Percentile 90%: 100%

STK_10	0.45291 <.0001 1318	0.29578 <.0001 1318	0.15819 <.0001 1302	0.41076 <.0001 1144	0.39079 <.0001 1318	0.45420 <.0001 1318	1.00000 1318

The correlations of the stroke measures are all positively correlated and statistically significant indicating that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

2b2.4. What is your interpretation of the results in terms of demonstrating validity? (i.*e., what do the results mean and what are the norms for the test conducted?*)
Overall, the positive inter-correlations indicates convergent validity of the measures. STK-06 is positively correlated with other stroke evidence-based processes of care.

2b3. EXCLUSIONS ANALYSIS .
NA ☐ no exclusions — *skip to section 2b4*

2b3.1. Describe the method of testing exclusions and what it tests (*describe the steps—do not just name a method; what was tested, e.g., whether exclusions affect overall performance scores; what statistical*

analysis was used)

The following exclusions were analyzed for frequency and variability across providers:

- Patients less than 18 years of age
- Patient who have a Length of Stay greater than 120 days
- Patients with *Comfort Measures*
- Patient enrolled in a Clinical Trial
- Patients admitted for *Elective Carotid Intervention*
- Patients with a documented *Reason For Not Prescribing Statin Medication at Discharge*
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

2b3.2. What were the statistical results from testing exclusions? (*include overall number and percentage of individuals excluded, frequency distribution of exclusions across measured entities, and impact on performance measure scores*)

There were 2, 206,379 admissions included in the initial cohort. From among the 2, 206,379 admissions in 1,318 hospitals, the descriptive statistics are given below.

Exclusion: *Comfort Measures Only*
Overall Occurrence n = 163,225
Overall Occurrence Percentage: 10.4%
Minimum: 0.30%
10th Percentile: 5.26%
Median: 10%
90th Percentile: 15.8%
Maximum: 35.7%

Exclusion: Clinical Trial
Overall Occurrence n = 5,446
Overall Occurrence Percentage: 0.25%
Minimum: 0.08%
10th Percentile: 0.24%
Median: 0.52%
90th Percentile: 1.90%
Maximum: 10%

Exclusion: Patients admitted for *Elective Carotid Intervention*
Overall Occurrence n = 259,833
Overall Occurrence Percentage: 11.8%
Minimum: 0.16%
10th Percentile: 2.28%
Median: 11.5%
90th Percentile: 25.3%
Maximum: 95.2%

Exclusion: Patients with a documented *Reason For Not Prescribing Statin Medication at Discharge*
Overall Occurrence n = 13,297
Overall Occurrence Percentage: 4.2%
Minimum: 0.24%
10th Percentile: 1.11%
Median: 3.31%

90th Percentile: 10.5%
Maximum: 29.7%

Exclusion: *Discharge Disposition* - Patients discharged to another hospital
Overall Occurrence n = 449,924
Overall Occurrence Percentage: 35.7%
Minimum: 0.787%
10th Percentile: 25%
Median: 35.4%
90th Percentile: 46%
Maximum: 76.2%

Exclusion: *Discharge Disposition* - Patients who left against medical advice
Overall Occurrence n = 8,396
Overall Occurrence Percentage: 0.67%
Minimum: 0.067%
10th Percentile: 0.34%
Median: 0.86%
90th Percentile: 2.4%
Maximum: 9.67%

Exclusion: *Discharge Disposition* - Patients who expired
Overall Occurrence n = 76,168
Overall Occurrence Percentage: 6.04%
Minimum: 0.398%
10th Percentile: 1.9%
Median: 5.08%
90th Percentile: 10.2%
Maximum: 20.1%

Exclusion: *Discharge Disposition* - Patients discharged to home for hospice care
Overall Occurrence n = 658,264
Overall Occurrence Percentage: 52.2%
Minimum: 6.25%
10th Percentile: 39%
Median: 51.9%
90th Percentile: 64%
Maximum 94.3%

Exclusion: *Discharge Disposition* - Patients discharged to a health care facility for hospice care
Overall Occurrence n = 37,804
Overall Occurrence Percentage: 3%
Minimum: 0.169%
10th Percentile: 0.87%
Median: 3.01%
90th Percentile: 6.4%
Maximum: 23%

2b3.3. What is your interpretation of the results in terms of demonstrating that exclusions are needed to prevent unfair distortion of performance results? (*i.e., the value outweighs the burden of increased data collection and analysis. Note: **If patient preference is an exclusion**, the measure must be specified so that the effect on the performance score is transparent, e.g., scores with and without exclusion*)

The median frequency of exclusions range from low to moderate. The distribution of exclusions across

hospitals is generally narrow indicating that the occurrence is random and likely would not bias performance results, although the percentage of patients excluded may differ depending on whether the hospital was a stroke center.

For criterion validity, it is believed that all of the exclusions should be retained for the following reasons:

Patients less than 18 years of age
Rationale: The literature does not support use in the pediatric patient.

Patients who have a Length of Stay greater than 120 days
Rationale: Included for this measure in order to harmonize with other CMS/Joint Commission aligned measures.

Patients with *Comfort Measures Only* documented
Rationale: It is inappropriate to treat such patients beyond those measures necessary for comfort.

Patients enrolled in a Clinical Trial
Rationale: Anticoagulation therapy as specified by this measure may compromise a clinical trial.

Patients admitted for *Elective Carotid Intervention*
Rationale: Patients who are not admitted for treatment of an acute stroke may not require statin therapy

Patients with a documented *Reason For Not Prescribing Statin Medication at Discharge*
Rationale: It is inappropriate to treat patients who have a documented reason or contraindication to statin therapy

Patients discharged to another hospital
Rationale: This measure is meant for patients discharged to home.

Patients who left against medical advice
Rationale: Hospitals do not have opportunity for provision of quality care for the non-compliant patient.

Patients who expired
Rationale: Patients who expire are not eligible to be in this measure

Patients discharged to home for hospice care
Rationale: Statin therapy may not be warranted for the hospice patient

Patients discharged to a healthcare facility for hospice care
Rationale: Statin therapy may not be warranted for the hospice patient.

3. Feasibility

Extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

3a. Byproduct of Care Processes

For clinical measures, the required data elements are routinely generated and used during care delivery (e.g., blood pressure, lab test, diagnosis, medication order).

3a.1. **Data Elements Generated as Byproduct of Care Processes.**

generated by and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition, Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims), Abstracted from a record by someone other than person obtaining original information (e.g., chart abstraction for quality measure or registry), Other

If other: Data element allowable values are selected, either manually or electronically, from clinical and coded data available in medical record documentation. All medical record documentation is used in the abstraction process. Vendor data collection tools are used to import data elements needed for measure rate calculation.

3b. Electronic Sources

The required data elements are available in electronic health records or other electronic sources. If the required data are not in electronic health records or existing electronic sources, a credible, near-term path to electronic collection is specified.

3b.1. **To what extent are the specified data elements available electronically in defined fields?** *(i.e., data elements that are needed to compute the performance measure score are in defined, computer-readable fields)*

Some data elements are in defined fields in electronic sources

3b.2. **If ALL the data elements needed to compute the performance measure score are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources.**

The Joint Commission recognizes that not all hospitals currently have the capacity to abstract the electronic version of this measure, so continues to offer this chart-abstracted version which allows for data capture from unstructured data fields. All data elements needed to compute the STK-6 performance measure score have been retooled for capture from electronic sources. Annual updates are performed to match the eCQM specifications to the current version of the chart-abstracted specifications.

3b.3. **If this is an eMeasure, provide a summary of the feasibility assessment in an attached file or make available at a measure-specific URL.**

Attachment:

3c. Data Collection Strategy

Demonstration that the data collection strategy (e.g., source, timing, frequency, sampling, patient confidentiality, costs associated with fees/licensing of proprietary measures) can be implemented (e.g., already in operational use, or testing demonstrates that it is ready to put into operational use). For eMeasures, a feasibility assessment addresses the data elements and measure logic and demonstrates the eMeasure can be implemented or feasibility concerns can be adequately addressed.

3c.1. **Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues.**

IF a PRO-PM, consider implications for both individuals providing PROM data (patients, service recipients, respondents) and those whose performance is being measured.

At the present time, hospitals using this performance measure generally collect measure data via manual review of the paper medical record, the EHR or a combination of both. Collected data are submitted to The Joint Commission on a quarterly basis, by way of contracted performance measurement system vendors, as described previously. Specifications for this measure are freely available to anyone who wishes to use the measure. Feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As described above, as feedback from measure users has indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

3c.2. **Describe any fees, licensing, or other requirements to use any aspect of the measure as specified** *(e.g., value/code set, risk model, programming code, algorithm)*.

There are no fees or licensing requirements to use the Joint Commission performance measures, all of which are in the public

domain.

4. Usability and Use

Extent to which potential audiences (e.g., consumers, purchasers, providers, policy makers) are using or could use performance results for both accountability and performance improvement to achieve the goal of high-quality, efficient healthcare for individuals or populations.

4a. Accountability and Transparency

Performance results are used in at least one accountability application within three years after initial endorsement and are publicly reported within six years after initial endorsement (or the data on performance results are available). If not in use at the time of initial endorsement, then a credible plan for implementation within the specified timeframes is provided.

4.1. Current and Planned Use

NQF-endorsed measures are expected to be used in at least one accountability application within 3 years and publicly reported within 6 years of initial endorsement in addition to performance improvement.

Planned	Current Use (for current use provide URL)
	Public Reporting Quality Check® http://www.qualitycheck.org/consumer/searchQCR.aspx Hospital Compare https://www.medicare.gov/hospitalcompare/search.html Public Health/Disease Surveillance Paul Coverdell National Acute Stroke Registry http://www.cdc.gov/dhdsp/programs/stroke_registry.htm Payment Program Hospital Inpatient Quality Reporting Program https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/hospitalqualityinits/hospitalrhqdapu.html Regulatory and Accreditation Programs Hospital Accreditation Program http://www.jointcommission.org/ Quality Improvement with Benchmarking (external benchmarking to multiple organizations) Annual Report – Improving America's Hospitals http://www.jointcommission.org/annualreport.aspx Quality Improvement (Internal to the specific organization) Disease-Specific Care Certification for Comprehensive Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx Disease-Specific Care Certification for Primary Stroke Centers http://www.jointcommission.org/certification/dsc_home.aspx

4a.1. For each CURRENT use, checked above, provide:

- Name of program and sponsor
- Purpose
- Geographic area and number and percentage of accountable entities and patients included

• Name of program and sponsor: Quality Check®; The Joint Commission

• Purpose: A public website that allows consumers to: search for accredited and certified organizations by city and state, by name or by zip code (up to 250 miles); find organizations by type of service provided within a geographic area; download free hospital performance measure results; and, print a list of Joint Commission certified disease-specific care programs and health care staffing firms.

• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-

accredited hospitals (2014)

• Name of program and sponsor: Hospital Compare; Centers for Medicare & Medicaid Services
• Purpose: A public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 4000+ Medicare-certified hospitals (2015)

• Name of program and sponsor: Paul Coverdell National Acute Stroke Registry; Centers for Disease Control and Prevention
• Purpose: A national registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke care within stroke systems of care.
• Geographic area and number and percentage of accountable entities and patients included: 11 states; 403 hospitals (CDC, 2014)

• Name of program and sponsor: Hospital Inpatient Quality Reporting Program; Centers for Medicare & Medicaid Services
• Purpose: The Hospital Inpatient Quality Reporting (Hospital IQR) program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3500 hospitals (2015)

• Name of program and sponsor: Annual Report-Improving America's Hospitals; The Joint Commission
• Purpose: The annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
•Geographic area and number and percentage of accountable entities and patients included: Nationwide; 3300 Joint Commission-accredited hospitals (2014)

• Name of program and sponsor: Disease-Specific Care Certification for Comprehensive Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
• Geographic area and number and percentage of accountable entities and patients included: Nationwide; 95 hospitals

• Name of program and sponsor Disease-Specific Care Certification for Primary Stroke Centers; The Joint Commission
• Purpose: A certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 1079 hospitals

• Name of program and sponsor Hospital Accreditation Program; The Joint Commission
• Purpose: An accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.
• Geographic area and number and percentage of accountable entities and patients included Nationwide; 3300 Joint Commission-accredited hospitals (2014)

4a.2. If not currently publicly reported OR used in at least one other accountability application (e.g., payment program, certification, licensing) what are the reasons? (*e.g., Do policies or actions of the developer/steward or accountable entities restrict access to performance results or impede implementation?*)
Not applicable

4a.3. If not currently publicly reported OR used in at least one other accountability application, provide a credible plan for implementation within the expected timeframes -- any accountability application within 3 years and publicly reported within 6 years of initial endorsement. (*Credible plan includes the specific program, purpose, intended audience, and timeline for implementing the measure within the specified timeframes. A plan for accountability applications addresses mechanisms for data aggregation and reporting.*)
Not applicable

4b. Improvement

Progress toward achieving the goal of high-quality, efficient healthcare for individuals or populations is demonstrated. If not in use for performance improvement at the time of initial endorsement, then a credible rationale describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.

4b.1. **Progress on Improvement. (Not required for initial endorsement unless available.)**
Performance results on this measure (current and over time) should be provided in 1b.2 and 1b.4. Discuss:

- **Progress (trends in performance results, number and percentage of people receiving high-quality healthcare)**
- **Geographic area and number and percentage of accountable entities and patients included**

• Progress (trends in performance results, number and percentage of people receiving high-quality healthcare):
Over the past five years, there has been steady but small increases of ~1-2% per year in the percentage of ischemic stroke patients with LDL > 100 mg/dL who are discharged on a statin medication based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 98.7%. A modest gap of ~5% still exists for the lowest decile of hospitals. This trend is consistent with increases in the rates for discharged on a statin medication published by GWTG-Stroke and PCNASR.

Racial and ethnic disparities persist for patients prescribed statin therapy at discharge, especially for black patients, as published based on data from the GWTG database (Schwamm LH, et al., 2010; Qian F, et al., 2013). Women are also less likely to receive a statin medication at discharge when compared to men (PCNASR, 2014).

• Geographic area and number and percentage of accountable entities and patients included:
Nationwide; 1296 hospitals; 140,296 patients (The Joint Commission, 2014)

4b.2. **If no improvement was demonstrated, what are the reasons? If not in use for performance improvement at the time of initial endorsement, provide a credible rationale that describes how the performance results could be used to further the goal of high-quality, efficient healthcare for individuals or populations.**
Although historic data for STK-6 demonstrates improvement over time for those ischemic stroke patients with LDL > 100 mg/dL, LDL not measured, or who were on a lipid-lowering medication prior to hospital arrival, there are no data currently available to evaluate performance for those ischemic stroke patients with LDL < 100 mg/dL who are prescribed a statin medication at discharge. Measure specifications have been revised to reflect current guideline recommendations. Data collection using the revised specifications was initiated with discharges on and after October 1, 2015. Somewhat lower measure rates are anticipated with the addition of those ischemic stroke patients with LDL < 100 mg/dL who are now included in the denominator population.

4c. Unintended Consequences

The benefits of the performance measure in facilitating progress toward achieving high-quality, efficient healthcare for individuals or populations outweigh evidence of unintended negative consequences to individuals or populations (if such evidence exists).

4c.1. **Were any unintended negative consequences to individuals or populations identified during testing; OR has evidence of unintended negative consequences to individuals or populations been reported since implementation? If so, identify the negative unintended consequences and describe how benefits outweigh them or actions taken to mitigate them.**
No unintended consequences due to the previous measure specifications or resulting from the recent changes to the measure specifications have been identified. One specific change to the measure specifications was modification of the Notes for Abstraction section for the data element definition Reason for Not Prescribing Statin Medication at Discharge. This change allows ischemic stroke patients with LDL < 70 mg/dL to be excluded from the measure population, and mitigates concerns about removal of the LDL data elements or the potential for inappropriate use of statins.

5. Comparison to Related or Competing Measures

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure.

5. Relation to Other NQF-endorsed Measures
Are there related measures (conceptually, either same measure focus or target population) or competing measures (conceptually both the same measure focus and same target population)? If yes, list the NQF # and title of all related and/or competing measures.
Yes

5.1a. **List of related or competing measures (selected from NQF-endorsed measures)**

0074 : Chronic Stable Coronary Artery Disease: Lipid Control
0118 : Anti-Lipid Treatment Discharge
0543 : Adherence to Statin Therapy for Individuals with Cardiovascular Disease
0545 : Adherence to Statins for Individuals with Diabetes Mellitus
0547 : Diabetes and Medication Possession Ratio for Statin Therapy
0639 : Statin Prescribed at Discharge
1519 : Statin Therapy at Discharge after Lower Extremity Bypass (LEB)

5.1b. **If related or competing measures are not NQF endorsed please indicate measure title and steward.**
0543 : Adherence to Statin Therapy for Individuals with Cardiovascular Disease; Centers for Medicare and Medicaid Services
0545 : Adherence to Statins for Individuals with Diabetes Mellitus – measure not in NQF database
0547 : Diabetes and Medication Possession Ratio for Statin Therapy; CMS
0639 : Statin Prescribed at Discharge; CMS

5a. Harmonization

The measure specifications are harmonized with related measures;
OR
The differences in specifications are justified

5a.1. **If this measure conceptually addresses EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):**
Are the measure specifications completely harmonized?
No

5a.2. **If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden.**
Three statin therapy measures were identified from the NQF database. All three measures address target diagnoses other than ischemic stroke or specific surgical procedures for patients 18 years or older: 0074 Coronary Artery Disease; 0118 isolated Coronary Artery Bypass Graft (CABG); and, 1519 Lower Extremity Bypass (LEB). Measure 1519 addresses inpatient organizational performance.. The other two measures, 0074 and 0118 are provider-level measures in the ambulatory care setting.

5b. Competing Measures

The measure is superior to competing measures (e.g., is a more valid or efficient way to measure);
OR
Multiple measures are justified.

5b.1. **If this measure conceptually addresses both the same measure focus and the same target population as NQF-endorsed measure(s):**
Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible.)
Not Applicable

MEASURE WORKSHEET

This document summarizes the evaluation of the measure as it progresses through NQF's Consensus Development Process (CDP). The information submitted by measure developers/stewards is included after the Brief Measure Information, Preliminary Analysis, and Pre-meeting Public and Member Comments sections.

Brief Measure Information

NQF #: 0441
Measure Title: STK-10: Assessed for Rehabilitation
Measure Steward: The Joint Commission
Brief Description of Measure: This measure captures the proportion of ischemic or hemorrhagic stroke patients assessed for or who received rehabilitation services during the hospital stay.
This measure is a part of a set of eight nationally implemented measures that address stroke care (STK-1: Venous Thromboembolism (VTE) Prophylaxis, STK-2: Discharged on Antithrombotic Therapy, STK-3: Anticoagulation Therapy for Atrial Fibrillation/Flutter, STK-4: Thrombolytic Therapy, STK-5: Antithrombotic Therapy By End of Hospital Day 2, STK-6 Discharged on Statin Medication, and STK-8: Stroke Education) that are used in The Joint Commission's hospital accreditation and Disease-Specific Care certification programs.
Developer Rationale: Stroke is a leading cause of serious, long-term disability, associated with significant costs. The primary goal of rehabilitation is to prevent complications, minimize impairments, and maximize function. Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.
Healthcare organizations that track rehabilitation assessments for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

Numerator Statement: Ischemic or hemorrhagic stroke patients assessed for or who received rehabilitation services.
Denominator Statement: Ischemic or hemorrhagic stroke patients.
Denominator Exclusions: • Less than 18 years of age
• Length of Stay > 120 days
• Comfort measures only documented
• Enrolled in clinical trials related to stroke
• Admitted for elective carotid intervention
• Discharged to another hospital
• Left against medical advice
• Expired
• Discharged to home for hospice care
• Discharged to a health care facility for hospice care

Measure Type: Process
Data Source: Electronic Clinical Data, Paper Medical Records
Level of Analysis: Facility, Population : National

IF Endorsement Maintenance – Original Endorsement Date: Jul 31, 2008 **Most Recent Endorsement Date:** Nov 01, 2012

Maintenance of Endorsement -- Preliminary Analysis

To maintain NQF endorsement endorsed measures are evaluated periodically to ensure that the measures still meets the NQF endorsement criteria ("maintenance"). The emphasis for maintaining endorsement is focused on how effective the measure is for promoting improvements in quality. Endorsed measures should have some experience from the field to inform the evaluation. The emphasis for maintaining endorsement is noted for each criterion.

Criteria 1: Importance to Measure and Report

1a. Evidence

Maintenance measures – less emphasis on evidence unless there is new information or change in evidence since the prior evaluation.

1a. Evidence. The evidence requirements for a *process or intermediate outcome* measure is that it is based on a systematic review (SR) and grading of the body of empirical evidence where the specific focus of the evidence matches what is being measured.

The developer provides the following evidence for this measure:

- **Systematic Review of the evidence specific to this measure?** ☒ **Yes** ☐ **No**
- **Quality, Quantity and Consistency of evidence provided?** ☒ **Yes** ☐ **No**
- **Evidence graded?** ☒ **Yes** ☐ **No**

Summary of prior review in 2012

- Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.
- AHA/ASA-Endorsed Management of Adult Stroke Rehabilitation Care: A Clinical Practice Guideline (2005).
    - Level I Evidence, Recommendation A - Organized and coordinated post-acute inpatient rehabilitation care improves outcome (page e-120).
        - Strongly recommend that once the patient is medically stable, the primary physician consult rehabilitation services (i.e., physical therapy, occupational therapy, speech and language pathology, kinesiotherapy, and physical medicine), as indicated, to assess the patient's rehabilitation needs and to recommend the most appropriate setting to meet those needs (page e-119).
- The 2012 Committee expressed no concerns regarding the evidence underlying this measure.

Changes to evidence from last review

☒ **The developer attests that there have been no changes in the evidence since the measure was last evaluated.**

☐ **The developer provided updated evidence for this measure:**

Exception to evidence

Not applicable

Guidance from the Evidence Algorithm

Process measure/systematic review (Box 3) → QQC presented (Box 4) → Quantity: high; Quality: Moderate; Consistency: Moderate/High(Box 5) → Box 5b Moderate

Questions for the Committee:

- *The developer attests the underlying evidence for the measure has not changed since the last NQF endorsement review. Does the Committee agree the evidence basis for the measure has not changed and there is no need for repeat discussion and voting on Evidence?*

Preliminary rating for evidence: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Preliminary rating for evidence: ☒ **Pass** ☐ **No Pass**

1b. Gap in Care/Opportunity for Improvement and 1b. Disparities
Maintenance measures – increased emphasis on gap and variation

1b. Performance Gap. The performance gap requirements include demonstrating quality problems and opportunity for improvement.

The developer provides the following national tend data:

	CY 2010	CY2011	CY 2012	CY 2013	CY 2014
# hospitals	138	157	158	262	1299
# cases (den)	23,875	28,415	28,735	44,242	210,075
National aggregate rate	0.96	0.97	0.98	0.98	0.98
Mean hospital rate	0.95	0.96	0.96	0.97	0.97
50th percentile	0.97	0.98	0.98	0.99	0.99
10th and 90th percentiles	0.87 (10th) 1.00 (90th)	0.89 (10th) 1.00 (90th)	0.92 (10th) 1.00 (90th)	0.95 (10th) 1.00 (90th)	0.94 (10th) 1.00 (90th)

- Participation in this measure has grown significantly in the past five years. National hospital performance seems to be very high with little to no room for improvement.
- In 2012, the Committee noted the overall high rate of performance for this measure (approximately 96% among reporting hospitals).

Disparities

- The developer does not provide disparities data from use of this measure.
- Several references are cited "According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age."

Questions for the Committee:

- *Data for 2014 includes 1,299 hospitals. What proportion of hospitals caring for stroke patients is captured in this data?*
- *Data over five years show significant improvement. How much further improvement in performance is likely using this measure?*
- *How can this measure be used to better understand disparities in care and outcome for certain groups?*

Preliminary rating for opportunity for improvement: ☐ **High** ☐ **Moderate** ☒ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 1: Importance to Measure and Report (including 1a, 1b, 1c)

1a. Evidence to Support Measure Focus

Comments: **the evidence is the same as before, agree with assessment; yet despite this, the some denominator criteria have been

changed...do we need to reconcile?
**No new studies/information
**The evidence for the measure has not changed since the last NQF endorsement review thus there is no need for repeat discussion and voting on Evidence.
**No new evidence since 2012. No vote on evidence. There is new evidence, but it doesn't appear to change any conclusions. There is a strong need for evidence with regard to disparities and more specific details about relationship of assessment/rehabilitation and outcomes.

1b. Performance Gap

Comments: **There remains little room for improvement at this point; the one caveat might be that presenting data broken down by race and SES might suggest there are still pockets where work needs to be done; not clear if developer has access to that data (via partnership with GWTG?). The literature presented suggest there are indeed still gaps by gender and race...rating might not be low if you can identify underserved groups where a meaningful gap still exists.
**high participation in this measure 98%
**Data on disparities is not provided, however there are many studies referenced that illustrate disparities with rehabilitation services based on SES and race/ethnicity. If outcomes from this measure could be micro-segmented to understand current gaps it would help address health inequities.
**Participation has grown considerably. Room for improvement is unclear. Without stratification of the data by various subgroups it is impossible to tell if there are notable performance gaps in various groups.

1c. High Priority (previously referred to as High Impact)

Comments: **NA
**N/A

Criteria 2: Scientific Acceptability of Measure Properties

2a. Reliability

2a1. Reliability Specifications

Maintenance measures – no change in emphasis – specifications should be evaluated the same as with new measures

2a1. Specifications requires the measure, as specified, to produce consistent (reliable) and credible (valid) results about the quality of care when implemented.

Data source(s):

- One data element defines the numerator and eight data elements define the denominator.
- Developer reports that "Since the last endorsement date, there have been no significant changes to STK-10 Assessed for Rehabilitation. Minor clarifications regarding the composition of the rehabilitation team have been made, and advanced practice nurse (APN) and physician assistant (PA) added to physician documentation as acceptable data sources for a rehabilitation assessment. Clarification was needed to prevent inclusion of other types of clinical assessments, e.g. activities of daily living, fall risk, etc., in the numerator population."
- Diagnosis and procedure codes have been converted from ICD-9 to ICD-10-CM diagnosis and ICD-10-PCS procedure codes. See attached spreadsheet Appendix A Table 8.1 (ischemic stroke) and Table 8.2 (hemorrhagic stroke)
- A conversion of ICD-9 to ICD-10 equivalent codes was consistent with the clinical intent of the original measure specifications:
    - "The Joint Commission worked with a certified coding expert throughout the conversion process. The 3M Coding Conversion Tool was utilized, including forward mapping of ICD-9 codes to ICD-10 codes as well as reverse mapping from ICD-10 to ICD-9 to ensure appropriateness. MSDRGs and instructions in the tabular index were also examined to ensure appropriate code mapping. Crosswalks comprising ICD-9 codes mapped to ICD-10 codes were created and reviewed by members of the Technical Advisory Panel, CMS subcontractors, and performance measurement system vendors prior to being posted for a 12 month public comment period. Feedback from the field indicated that the crosswalks generally were mapped correctly. Minor modifications to the code tables were made as needed. Final code tables were

published in early 2015, well in advance of the mandated date of October 1, 2015 developer advisory panel determined that the intent of the measure was changed by the conversion to ICD-10 and a crosswalk was posted."

- Sampling monthly or quarterly is allowed; instructions for sampling are provided.
- A web-based data collection tool has been developed but is not described. Hospitals are not required to use this tool.
- The measures is specified at the hospital level of analysis.

Questions for the Committee :

- o *Are all the data elements clearly defined? Are all appropriate codes included?*
- o *Is the logic or calculation algorithm clear?*
- o *Is it likely this measure can be consistently implemented?*

2a2. Reliability Testing Testing attachment
Maintenance measures – less emphasis if no new testing data provided

2a2. Reliability testing demonstrates if the measure data elements are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period and/or that the measure score is precise enough to distinguish differences in performance across providers.

Reliability testing from prior review in 2012:

- Inter rater-reliability of the data elements for one year (4Q2010-3Q2011) in 77 hospitals and 739 patient records showed an overall agreement rate of 98.3%.

SUMMARY OF TESTING

Reliability testing level ☐ **Measure score** ☒ **Data element** ☐ **Both**

Reliability testing performed with the data source and level of analysis indicated for this measure ☒ **Yes** ☐ **No**

Method(s) of reliability testing see above

Results of reliability testing see above

Guidance from the Reliability Algorithm

Precise specifications (Box 1) → empirical testing as specified (Box 2) → reliability testing with patient-level data elements (Box 8) → assessed all critical data elements (Box 9) → high/moderate certainty the data elements are reliable (Box 10) → Moderate (NOTE: As testing was only done at the data element level and not at the measure score level, the highest rating possible is moderate.)

Questions for the Committee:

- o *The developer has not provided any new reliability testing. Does the Committee agree there is no need for repeat discussion and voting on Reliability?*

Preliminary rating for reliability: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

2b. Validity
Maintenance measures – less emphasis if no new testing data provided

2b1. Validity: Specifications

2b1. Validity Specifications. This section should determine if the measure specifications are consistent with the evidence.

Specifications consistent with evidence in 1a. ☒ **Yes** ☐ **Somewhat** ☐ **No**

Specification not completely consistent with evidence

Question for the Committee:

- *Are the specifications consistent with the evidence?*

2b2. Validity testing

2b2. Validity Testing should demonstrate the measure data elements are correct and/or the measure score correctly reflects the quality of care provided, adequately identifying differences in quality.

Validity testing from the prior review in 2012:

- Face validity of the data was assessed via survey and focus groups of hospitals participating in the pilot test.
- The developer reports that "All measure specifications, including population identification, numerator and denominator statements and exclusions, and data elements and their definitions were found to be understandable, retrievable, and relevant."
- The information provided does not indicate that face validity of the measure score as a representation of quality was systematically assessed.
- Ongoing feedback from measure users is systematically reviewed to identify trends and/or measure specifications that require clarification or revision. Predominantly, questions involving the data element Assessed for Rehabilitation Services, specifically questions regarding the composition of the rehabilitation team and the qualifications needed to complete the rehabilitation assessment despite detailed inclusion guidelines.
-

Describe any updates to validity testing– New empirical validity testing data is presented

SUMMARY OF TESTING

Validity testing level ☒ **Measure score** ☐ **Data element testing against a gold standard** ☐ **Both**

Method of validity testing of the measure score:

☐ **Face validity only**

☒ **Empirical validity testing of the measure score**

Validity testing method:

- Pearson Correlation Coefficients were calculated for seven stroke measures for hospitals that reported 12 months of data and had 30 or more denominator cases for the year (2014-2015).Presumably high performing hospitals would do well on all stroke performance measures.

Validity testing results:

- Analysis of 1,318 hospitals and 2,206,379 patients records generated a table of Pearson Correlation Coefficient results that shows a statistically significant (P<.0001), positive correlation of this measure with six other stroke performance measures supporting the hypothesis that hospitals with high quality on one stroke measure tend to have high performance on the other stroke measures.

Questions for the Committee:

- *Is the test sample adequate to generalize for widespread implementation?*
- *Do the results demonstrate sufficient validity so that conclusions about quality can be made?*
- *Do you agree that the score from this measure as specified is an indicator of quality?*

2b3-2b7. Threats to Validity

2b3. Exclusions:

- Patients are excluded from the measure for the following reasons:
  - Patients less than 18 years of age
  - Patient who have a Length of Stay greater than 120 days

- Patients with Comfort Measures
- Patient enrolled in a Clinical Trial
- Patients admitted for Elective Carotid Intervention
- Patients discharged to another hospital
- Patients who left against medical advice
- Patients who expired
- Patients discharged to home for hospice care
- Patients discharged to a health care facility for hospice care

- New data on the frequency of exclusions is presented for 2, 206,379 admissions in 1,318 hospitals:
  - Comfort Measures Only: 10% (range 0.30-35.7%)
  - Clinical Trial: 0.52% (range 0.08- 10%)
  - Patients admitted for Elective Carotid Intervention: 11.5% (range 0.16-95.2%)
  - Patients discharged to another hospital: 35.4% (range 0.78 -76.2%)
  - Patients who left against medical advice: 0.86% (range 0.06-9.67%)
  - Patients who expired: 5.08% (range 0.39-20.1%)
  - Patients discharged to home for hospice care: 51.9% (range 6.25-94.3%)
  - Patients discharged to a health care facility for hospice care: 3% (range 0.16-23%)
  -

Questions for the Committee:

- *Are the exclusions consistent with the evidence?*
- *Are any patients or patient groups inappropriately excluded from the measure?*
- *Are the exclusions/exceptions of sufficient frequency and variation across providers to be needed (and outweigh the data collection burden)?*

2b4. Risk adjustment: **Risk-adjustment method** ☒ **None** ☐ **Statistical model** ☐ **Stratification**

- *Do you agree with the developer's decision, based on their analysis, to not include SDS factors in their risk-adjustment model?*

2b5. Meaningful difference *(can statistically significant and clinically/practically meaningful differences in performance measure scores can be identified)*:

- Performance data is presented above under opportunity for improvement. Complete details of the data is presented in 1b.
- The developer explains their approach: "There are two components to the target analysis methodology used at The Joint Commission. Given the national average for a performance measure, a target range is constructed. Using generalized linear mixed models methodology (also known as hierarchical models), a predicted estimate of a HCO's performance, with a corresponding 95% confidence interval, is generated. This confidence interval is compared to the target range, to determine the HCO's rating. The estimate of the organization's true performance is based on both the data from that organization and on data from the entire set of reporting organizations."

Question for the Committee:

- *Does this measure identify meaningful differences about quality?*

2b6. Comparability of data sources/methods: Not applicable

2b7. Missing Data

- The developer describes the handling of missing data in the measure specifications (S.22) but does not provide information on the frequency of missing data or potential impact on measure results.

Guidance from algorithm: Specifications consistent with evidence (Box 1) → potential threats to validity mostly assessed (Box2) →empirical validity testing (Box 3) → measure score testing (Box 6) → sound conceptualization and hypotheses (Box 7) →moderate confidence that score are a valid indicator of quality(Box 8a) → High

Preliminary rating for validity: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 2: Scientific Acceptability of Measure Properties (including all 2a, 2b, and 2d)

2a1. & 2b1. Specifications

Comments: **changed denom specs to agree with 2013 ACC, but then ignore the ACC <75 recommendation? Also, added LDL <70 as reason not to give, new but no new evidence to support

**Specifications clear

**The test sample is adequate to generalize for widespread implementation. The results demonstrate sufficient validity so that conclusions about quality can be made. The score from this measure as specified is an indicator of quality.

**Again, validity appears to be quite strong within the data presented. Validity with regard to various population groups and various assessments and rehabilitation methods in relation to outcomes would be quite helpful.

2a2. Reliability Testing

Comments: **o Is the test sample adequate to generalize for widespread implementation? Very large sample, so probably

o Do the results demonstrate sufficient validity so that conclusions about quality can be made? I think so

o Do you agree that the score from this measure as specified is an indicator of quality? yes

**New testing of measure is sufficient

**The test sample is adequate to generalize for widespread implementation. The results demonstrate sufficient validity so that conclusions about quality can be made. The score from this measure as specified is an indicator of quality.

**Validity is also quite good within the existing framework - stretching beyond that framework, as above would be desirable.

**New criteria testing not seen since so new?

**No new testing needed

2b2. Validity Testing

Comments: **Home for hospice 52% as largest exclusion, doesn't sound right.

As discussed above, not sure the differences at hospital level have much meaning

**large# pts excluded in new data, eg, 51.9% of pts discharged to home for hospice

**Information is not provided on missing data frequency nor impact on results. This may constitute a threat to the validity of this measure.

**High levels of exclusions are a concern. It seems likely some of those groups that are excluded might be worthy of inclusion.

**Is the test sample adequate to generalize for widespread implementation? Very large sample, so probably

Do the results demonstrate sufficient validity so that conclusions about quality can be made? I think so

Do you agree that the score from this measure as specified is an indicator of quality? yes

**New testing of measure is sufficient

2b3. Exclusions Analysis

2b4. Risk Adjustment/Stratification for Outcome or Resource Use Measures

2b5. Identification of Statistically Significant & Meaningful Differences In Performance

2b6. Comparability of Performance Scores When More Than One Set of Specifications

2b7. Missing Data Analysis and Minimizing Bias

Comments: **new criteria testing not seen since so new?

**No new testing needed

**There is no need for repeat discussion and voting on Reliability.

**Reliability testing within the framework is quite strong - voting may not be necessary.

**"Home for hospice 52% as largest exclusion, doesn't sound right.

As discussed above, not sure the differences at hospital level have much meaning"

**Large # pts excluded in new data, eg, 51.9% of pts discharged to home for hospice

Criterion 3. Feasibility

Maintenance measures – no change in emphasis – implementation issues may be more prominent

3. Feasibility is the extent to which the specifications including measure logic, require data that are readily available or could be captured without undue burden and can be implemented for performance measurement.

- Data source is medical record abstraction: not all hospitals are able to generate the data electronically so a paper-based option is available
- Some data elements are in defined fields in electronic sources.
- Data collection burden is significant.

Questions for the Committee:

- *Are the required data elements routinely generated and used during care delivery?*
- *Are the required data elements available in electronic form, e.g., EHR or other electronic sources?*
- *Is the data collection strategy ready to be put into operational use?*

Preliminary rating for feasibility: ☐ **High** ☒ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 3: Feasibility

3a. Byproduct of Care Processes

3b. Electronic Sources

3c. Data Collection Strategy

Comments: **quite feasible

**No concerns

**The required data elements are routinely generated and used during care delivery. The required data elements are available in electronic form. The data collection strategy is ready to be put into operational use.

**Data are available in the records (EHR in 2837). Should be relatively easy to use. There may be cases where the type of assessment and the type of rehabilitation are variable making interpretation less clear.

Criterion 4: Usability and Use

Maintenance measures – increased emphasis – much greater focus on measure use and usefulness, including both impact /improvement and unintended consequences

4. Usability and Use evaluate the extent to which audiences (e.g., consumers, purchasers, providers, policymakers) use or could use performance results for both accountability and performance improvement activities.

Current uses of the measure

Publicly reported? ☒ **Yes** ☐ **No**

Current use in an accountability program? ☒ **Yes** ☐ **No**

OR

Planned use in an accountability program? ☐ **Yes** ☐ **No**

Accountability program details

- The Joint Commission Quality Check®: Public website that allows consumers to search for accredited and certified organizations.
- CMS Hospital Compare: Public website that provides information that helps consumers decide where to obtain healthcare and encourages hospitals to improve the quality of care they provide.
- CDC Paul Coverdell National Acute Stroke Registry: National registry that measures, tracks, and improves the quality of care and access to care for stroke patients from onset of stroke symptoms through rehabilitation and recovery; decreases rate of premature death and disability from stroke; eliminates disparities in care; supports the comprehensive stroke system across the continuum of care; improves access to rehabilitation and opportunities for recovery after stroke; and, increases the workforce capacity and scientific knowledge of stroke

care within stroke systems of care.

- CMS Hospital Inpatient Quality Reporting Program (IQR): The Hospital IQR program was mandated by Section 501(b) of the Medicare Prescription Drug, Improvement, and Modernization Act (MMA) of 2003. This section of the MMA authorized CMS to pay hospitals that successfully report designated quality measures a higher annual update to their payment rates.
- The Joint Commission Annual Report-Improving America's Hospitals: Annual report summarizes the performance of Joint Commission-accredited hospitals on 46 accountability measures of evidence-based care processes closely linked to positive patient outcomes, and provides benchmarks from Top Performer on Key Quality Measures® hospitals.
- The Joint Commission Disease-Specific Care Certification for Comprehensive Stroke Centers: Certification program that recognizes the specific capabilities of hospitals that treat the most complex stroke cases.
- The Joint Commission Disease-Specific Care Certification for Primary Stroke Centers: Certification program that recognizes hospitals that effectively manage and meet the unique and specialized needs of stroke patients, and make exceptional efforts to foster improved outcomes for better stroke care.
- The Joint Commission Hospital Accreditation Program: Accreditation program that recognizes hospitals that meet standard requirements to provide safe and effective patient care.

Improvement results

- The developer provided the following progress information on 1,256 hospitals nationwide and 180,048 patients:
    - The rate of patients assessed for rehabilitation services during the inpatient hospitalization has steadily increased ~1% per year over the past five years based on Joint Commission ORYX performance measurement data. The national aggregate rate reported for 2014 was 98.7%. A modest gap of approximately 5% still exists for the 10th percentile of hospitals. This trend is consistent with increases in the rate in the assessment for rehabilitation services published by GWTG-Stroke and PCNASR.
    - Significant and important differences between races in rates of length of stay and less likely to be discharged home. (Qian, 3013; CDC 2014).

Unexpected findings (positive or negative) during implementation:

- Developer did not identify unexpected findings during implementation.

Potential harms:

- The developer did not identify any unintended consequences related to this measure.

Feedback :

- The developer states that feedback from hospitals using this measure indicates that required data elements are generally available in the medical record, and measure specifications are robust and easy to understand. As previously noted, measure users have indicated the need for clarification or revision of measure specifications, this has taken place in the form of guidelines for abstraction. Specific revisions are detailed in the Release Notes section of this submission.

***Questions for the Committee**:*

- *How can the performance results be used to further the goal of high-quality, efficient healthcare?*
- *Do the benefits of the measure outweigh any potential unintended consequences?*

Preliminary rating for usability and use: ☒ **High** ☐ **Moderate** ☐ **Low** ☐ **Insufficient**

Committee pre-evaluation comments

Criteria 4: Usability and Use

4a. Accountability and Transparency

4b. Improvement

4c. Unintended Consequences

Comments: **adequate

**High usability

**Although small, there are still opportunities to improve in this measure. No unintended consequences were identified. Identifying disparities in care by SES or race/ethnicity as above would contribute to improved quality of care.

**Data will be public and can easily be used for accountability. They will also provide a foundation for further research into some of the subgroups which may have varied results.

Criterion 5: Related and Competing Measures

Related or competing measures

NQF # 0244: Stroke and Stroke Rehabilitation: Rehabilitation Services Ordered- *no longer NQF-endorsed*

Harmonization:

Not applicable

Pre-meeting public and member comments

No comments were submitted for this measure during the pre-meeting comment period.

NATIONAL QUALITY FORUM

Measure missing data in MSF 6.5 from MSF 5.0

NQF #: 0441 NQF Project: Neurology Project

1. IMPACT, OPPORTUITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See guidance on evidence.
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)

1c.1 Structure-Process-Outcome Relationship *(Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome)*:
The focus of the measure is to prevent complications, minimize impairments, and maximize function post stroke by assessing the patient's need for rehabilitation services and/or initiating rehabilitation.
Assessed for rehabilitation need >> rehabilitation services received >> improved neurological outcomes >> decreased morbidity and mortality.

1c.2-3 Type of Evidence *(Check all that apply)*:
Clinical Practice Guideline
Selected individual studies (rather than entire body of evidence)
Systematic review of body of evidence (other than within guideline development)

1c.4 Directness of Evidence to the Specified Measure *(State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population)*:
This measure is consistent with the adult stroke rehabilitation care guidelines developed for the Veterans Health Administration and Department of Defense Medical Systems and endorsed by the American Heart Association/American Stroke Association (2005). Guideline recommendations incorporated information from existing evidence-based guidelines from the Agency for Health Care Policy and Research (AHCPR) Post-Stroke Rehabilitation (1995), the Scottish Intercollegiate Guidelines Network (SIGN) Management of Patients with Stroke (1997), and the Royal College of Physicians (RCP) National Clinical Guidelines for Stroke (2000).

1c.5 Quantity of Studies in the Body of Evidence *(Total number of studies, not articles)*: According to the 2011 update from the Evidence-Based Review of Stroke Rehabilitation (EBRSR), 2000 studies including 1, 078 randomized control trials (RCTs) have been identified in the stroke rehabilitation literature. The 2001 EBSRS identified five meta-analyses of the effectiveness of stroke rehabilitation:

- Langhorne, et al. (1993) – 10 RCTs conducted between 1962 and 1993. Results revealed that management of stroke patients on a stroke unit was associated with lower mortality rates than general medical wards, and a 28% reduction in the risk of death occurring in the first 17 weeks post-stroke.
- Ottenbacher and Jannell (1993) – 36 RCTs (n=3,717 patients). Patients who participated in an individualized stroke rehabilitation programs performed better than 65% of those patients in the comparison group. Greater functional improvements were observed in younger patients and those with relatively short stroke onset to rehabilitation admission intervals.
- Stroke Unit Trialists' Collaboration (2007) - 31 RCTs. Stroke unit care was associated with a significant reduction in death (OR 0.86; 95% CI 0.76-0.98; P=0.02) at a median of one-year follow-up. Stroke unit care was also associated with a significant reduction in the combined outcomes or both death or institutional care (OR 0.82; 95% CI 0.73-0.92; P=0.0006) and death or dependency (OR 0.82; CI 95% 0.73-0.92, P=0.001).
- The Canadian Coordinating Office of Health Technology Assessment (CCOHTA) (2003) – 6 RCTs (n=1,709 patients) from 1995 to July 2002. Stroke unit care was associated with a reduction in the odds of death (OR 0.60; CI 95% 0.42-0.86) an outcome recorded in all studies.
- Seenan, et al. (2007) – 18 non-randomized trials, which more closely approximate usual clinical practice. Findings reported

were similar to prior meta-analyses of RCTs. The odds of death (OR 0.79; 95% CI 0.72-0.86) and poor outcome (OR 0.87; CI 9%%0.80-0.95) were reduced for patients receiving stroke unit care compared to general medical management.

In addition, a total of 37 individual studies (14 non-randomized and 23 RCTs) of the efficacy of stroke rehabilitation were included in the review. Only the results of RCTs and quasi RCTs were used to formulate conclusions. Studies were categorized according to the type of care provided ranging from acute stroke management to settings that offered various levels of rehabilitation services (i.e., combined acute and rehabilitation stroke units, subacute rehabilitation units, and mobile stroke teams). Overall, the body of evidence strongly supports that units providing stroke rehabilitation are associated with improved functional outcomes for patients.

1c.6 Quality of Body of Evidence (*Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events):* The quality of evidence supporting stroke rehabilitation is moderate. The impact of stroke rehabilitation on outcomes has been difficult to quantify due to problems with study design and methodology (e.g., lack of randomization, inappropriate control group selection, failure to blind assessors, difficulty in controlling for all possible confounders) detected by systematic review. Furthermore, issues inherent to stroke rehabilitation, such as controlling for spontaneous neurological recovery, daily fluctuation in individual function, and difficulties measuring functional outcomes have challenged study designs. Pre-selection of patients and observer measurement bias are additional concerns when studying the impact of stroke rehabilitation on outcomes (Foley, et al, 2011).

1c.7 Consistency of Results across Studies *(Summarize the consistency of the magnitude and direction of the effect):* The body of evidence consistently supports that rehabilitation services minimize functional impairment and improve clinical outcomes for patients following stroke. Furthermore, most stroke patients have some residual deficits following the event, and can benefit from rehabilitation services tailored to improved cognitive, speech, or motor function. Based on these findings, a rehabilitation assessment should be completed for all stroke patients prior to hospital discharge.

1c.8 Net Benefit *(Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms)*:
There is strong evidence on the net benefits of stroke rehabilitation. The body of evidence clearly supports that stroke rehabilitation is associated with a reduction in the odds of death or dependency and the need for institutionalization. There is strong evidence that stroke rehabilitation improves functional outcomes. There is also strong evidence that stroke rehabilitation reduces mortality for a subset of more severe stroke patients.

There is no dispute that stroke represents a significant economic burden in developed countries; however, there is some uncertainty respecting the cost-effectiveness of stroke rehabilitation. Most of the studies have been conducted outside of the United States in the United Kingdom, Australia, or the Netherlands. Stroke recovery and residual disability are highly variable. Studies have ignored the contributions of family members and/or caregivers towards rehabilitative progress, and the discrete components of caregiver and associated costs are difficult to isolate.

Although findings differ, there is some evidence of the cost-effectiveness of stroke rehabilitation services. Kalra et al. (2005) found stroke unit care to be more effective than home care, and also to be of equal cost (using per patient day alive), suggesting that stroke unit care is more cost-effective than home care. Using prospectively collected data from the Stroke Care Outcome: Providing Effective Services (SCOPES) trial over six months, Moodie et al. (2007 - Australia) compared the effectiveness of stroke units, conventional care, and a mobile service. While better outcomes were noted for patients cared for in stroke units, the incremental costs were higher compared to conventional care. Saka et al. (2009 – UK) projected the cost-effectiveness of three types of care over a 10-year period: stroke units with early supported discharge (ESD), stroke units without ESD, and general medical-surgical care. Although the costs of care were greater for both stroke units when compared to general medical-surgical wards, the cost per quality-adjusted life years (QALY) was lowest for stroke units with ESD (Foley, et al., 2011).

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? Yes

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: The Evidence-Based Review of Stroke Rehabilitation (EBRSR) funded by the Canadian Stroke Network (CSN).

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: Canadian Stroke Network; 2010 Dec 8. p. 129-150.
Rating Scheme for the Strength of the Evidence
Summary of Definitions for Levels of Evidence*
Grade A – Criteria – Strong recommendation. Evidence from randomized controlled trials or meta-analysis of randomized controlled trials. Desirable effects clearly outweigh undesirable effects, or vice versa.
Grade B – Criteria – Single randomized controlled trial or well-designed cohort or case-control analytic study; or multiple time series or dramatic results of uncontrolled experiment. Desirable effects closely balanced with undesirable effects.
Grade C – Criteria – At least one well-designed, nonexperimental descriptive study (e.g., comparative studies, correlation studies, case studies) or expert committee reports, opinions and/or experience of respected authorities, including consensus from development and/or reviewer groups.

1c.16 Quote verbatim, the specific guideline recommendation *(Including guideline # and/or page #)*:
AHA/ASA-Endorsed Management of Adult Stroke Rehabilitation Care: A Clinical Practice Guideline (2005).
Level I Evidence, Recommendation A
Organized and coordinated post-acute inpatient rehabilitation care improves outcome (page e-120).
1. Strongly recommend that once the patient is medically stable, the primary physician consult rehabilitation services (i.e., physical therapy, occupational therapy, speech and language pathology, kinesiotherapy, and physical medicine), as indicated, to assess the patient's rehabilitation needs and to recommend the most appropriate setting to meet those needs (page e-119).

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? Yes

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation

and any disclosures regarding bias: The Stroke Council of the American Heart Association has chosen to endorse the VA DoD guideline for stroke rehabilitation (Management of Stroke Rehabilitation. Washington, DC: VA/DoD Clinical Practice Guideline Workgroup, Veterans Health Administration, Department of Veterans Affairs and Health Affairs, Department of Defense, February 2003). The Department of Defense and Veterans Health Administration panel of experts evaluated the medical evidence according to criteria proposed by the US Preventive Services Task Force. The American Heart Association/American Stroke Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

1c.21 System Used for Grading the Strength of Guideline Recommendation: USPSTF

1c.22 If other, identify and describe the grading scale with definitions:

1c.23 Grade Assigned to the Recommendation: A: A strong recommendation that the intervention is always indicated and acceptable.

1c.24 Rationale for Using this Guideline Over Others: The American Heart Association (AHA) is the leading organization in the United States that fosters appropriate cardiac care in an effort to reduce disability and deaths caused by cardiovascular disease and stroke. The American Stroke Association (ASA) is an AHA affiliated organization which focuses on care, research, and prevention of stroke. AHA/ASA Scientific Statements and clinical guideline recommendations provide physicians, emergency healthcare providers, and other stroke care professionals with current evidence on components of the evaluation and treatment of stroke patients. AHA/ASA statements and recommendations are released and updated on a continuing basis.

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?
1c.25 Quantity: High 1c.26 Quality: Moderate1c.27 Consistency: Moderate

1. Evidence, Performance Gap, Priority – Importance to Measure and Report

Extent to which the specific measure focus is evidence-based, important to making significant gains in healthcare quality, and improving health outcomes for a specific high-priority (high-impact) aspect of healthcare where there is variation in or overall less-than-optimal performance. ***Measures must be judged to meet all subcriteria to pass this criterion and be evaluated against the remaining criteria.***

1a. Evidence to Support the Measure Focus – See attached Evidence Submission Form
0441_Evidence_MSF5.0_Data.doc

1b. Performance Gap

Demonstration of quality problems and opportunity for improvement, i.e., data demonstrating:

- considerable variation, or overall less-than-optimal performance, in the quality of care across providers; and/or
- disparities in care across population groups.

1b.1. **Briefly explain the rationale for this measure** *(e.g., the benefits or improvements in quality envisioned by use of this measure)*
Stroke is a leading cause of serious, long-term disability, associated with significant costs. The primary goal of rehabilitation is to prevent complications, minimize impairments, and maximize function. Evidence suggests that better clinical outcomes are achieved when post-acute stroke patients receive coordinated, multidisciplinary evaluation and intervention through the provision of rehabilitation services. Therefore, the need for rehabilitation services after an ischemic or hemorrhagic stroke should be assessed prior to discharge from the acute care setting.

Healthcare organizations that track rehabilitation assessments for internal quality improvement purposes have seen an improvement in the measure rate over time. This measure has been included in the Hospital Inpatient Quality Reporting Program for three years (i.e., FY 2015, FY 2016, FY 2017) to promote improvements in quality at the national level.

1b.2. **Provide performance scores on the measure as specified (current and over time) at the specified level of analysis.** *(This is required for endorsement maintenance. Include mean, std dev, min, max, interquartile range, scores by decile. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included). This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
In October, 2009, The Joint Commission added the stroke (STK) measure set as a new core measure option to meet performance measure requirements for Joint Commission hospital accreditation purposes. Below is the specified level of analysis for STK-10 Assessed for Rehabilitation beginning with discharges 4Q 2009 through December 31, 2014.

4Q 2009: 2555 denominator cases; 2473 numerator cases; 49 hospitals; 0.96791 national aggregate rate; 0.95212 mean of hospital rates; 0.07659 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.97744 50th percentile rate/median rate; 0.95 25th percentile rate/lower quartile; and, 0.85294 10th percentile rate.

CY 2010: 23,875 denominator cases; 23,144 numerator cases; 138 hospitals; 0.96938 national aggregate rate; 0.95282 mean of hospital rates; 0.06331 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.97731 50th percentile rate/median rate; 0.93333 25th percentile rate/lower quartile; and, 0.875 10th percentile rate.

CY 2011: 28,415 denominator cases; 27,731 numerator cases; 157 hospitals; 0.97593 national aggregate rate; 0.96355 mean of hospital rates; 0.06802 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98671 50th percentile rate/median rate; 0.96203 25th percentile rate/lower quartile; and, 0.89939 10th percentile rate.

CY 2012: 28,735 denominator cases; 28,272 numerator cases; 158 hospitals; 0.98389 national aggregate rate; 0.96919 mean of hospital rates; 0.06586 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.98917 50th percentile rate/median rate; 0.96875 25th percentile rate/lower quartile; and, 0.92857 10th percentile rate.

CY 2013: 44,242 denominator cases; 43,527 numerator cases; 262 hospitals; 0.98384 national aggregate rate; 0.97722 mean of hospital rates; 0.05526 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99131 50th percentile rate/median rate; 0.97605 25th percentile rate/lower quartile; and, 0.95652 10th percentile rate.

CY 2014: 210,075 denominator cases; 207,311 numerator cases; 1299 hospitals; 0.98684 national aggregate rate; 0.9772 mean of hospital rates; 0.06807 standard deviation; 1.0 90th percentile rate; 1.0 75th percentile rate/upper quartile; 0.99433 50th percentile rate/median rate; 0.98 25th percentile rate/lower quartile; and, 0.94737 10th percentile rate.

1b.3. If no or limited performance data on the measure as specified is reported in 1b2, then provide a summary of data from the literature that indicates opportunity for improvement or overall less than optimal performance on the specific focus of measurement.
Not applicable

1b.4. Provide disparities data from the measure as specified (current and over time) by population group, e.g., by race/ethnicity, gender, age, insurance status, socioeconomic status, and/or disability. *(This is required for endorsement maintenance. Describe the data source including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities include.) This information also will be used to address the subcriterion on improvement (4b.1) under Usability and Use.*
Not applicable

1b.5. If no or limited data on disparities from the measure as specified is reported in 1b4, then provide a summary of data from the literature that addresses disparities in care on the specific focus of measurement. Include citations.
According to a 2011 report from the American Heart Association/American Stroke Association, racial disparities in stroke care exist and are more predominant among people < 65 years of age. Evidence of disparities in stroke care between minority groups and whites include: lack of knowledge about the risk factors for stroke; lack of awareness about stroke signs and symptoms and the need for urgent treatment; and, access to care respecting prevention services, acute stroke treatment, and rehabilitation. Differences in care are also related to the socioeconomic status of minorities, insurance coverage, cultural beliefs and attitudes, language barriers, immigration status, mistrust of the healthcare system, and the number of providers representing minority groups. These are all factors contributing to the quality of stroke care (Cruz-Flores, et al. 2011).

Each year in the United States, ˜ 55,000 more women than men have a stroke. Statistics reveal that women have a higher "life-time risk of stroke" than men. (Mozaffarian D, et al., 2015). In the Framingham Heart Study, lifetime risk of stroke among those 55 to75 years of age was 1 in 5 for women (20% to 21%) and ˜1 in 6 for men (14% to 17%).

The burden of stroke is higher in Blacks or African Americans and Hispanics than whites. Racial and ethnic minorities have excess deaths from stroke and also experience greater years of potential life lost than non-Hispanic whites. The risk ratio for stroke mortality in all racial and ethnic minorities is higher in the 35-to-64-year-old age group, however, this risk decreases as people age. After age 64 non-Hispanic whites have an equal risk for stroke when compared to Hispanics and American Indian-Alaskan Natives. This equalization of rate of stroke presents again after age 85 in blacks or African Americans (Cruz-Flores, et al., 2011).

In the national REGARDS cohort, 27,744 black and white men and women, aged > 45 years, followed over 4.4 years, and stroke-free at baseline, reported an overall age-adjusted and sex-adjusted black/white incidence rate ratio of 1.51. At ages 45 to 54 years, the rate ratio increased to 4.02 compared to 0.86 for > 85 years. A higher incidence of stroke is reported for blacks at younger ages.

The REGARDS investigators found that approximately half of racial disparity in stroke risk is attributable to traditional risk factors (primarily systolic blood pressure) and socioeconomic factors (Howard, et al., 2011). Brown and colleagues (2011) found a higher incidence of ischemic stroke in disadvantaged white neighborhoods, but found no significant associations between neighborhood socioeconomic status and ischemic stroke among blacks. A recent large population-based Canadian study examined gender-adjusted, age-adjusted prevalence of cardiovascular risk factors, heart disease and stroke in four ethnic groups: white (n=154,653); South Asian (N=3364); Chinese (n=3038) and, blacks (n=2742). Stroke incidence was highest in the South Asian group (1.7%) and lowest in the Chinese population (0.6%). The increased risk in the South Asian population was attributed to high susceptibility to insulin resistance and metabolic syndrome, and a tendency to develop diabetes mellitus at younger ages in both men and women as compared to other ethnic groups (Chiu, et al., 2010).

The BASIC (Brain Attack Surveillance in Corpus Christi) project (NINDS) demonstrated an increased incidence of stroke among Mexican Americans compared with non-Hispanic whites in a community in southeast Texas. The crude 3-year cumulative incidence (2000-2003) was 16.8 per 1000 in Mexican Americans and 13.6 per 1000 in non-Hispanic whites. Specifically, Mexican Americans had a higher cumulative incidence for ischemic stroke at younger ages (45-59 years of age: RR 2.04, 95% CI 1.55-2.69; 60-74 years if age: RR 1.58, 95% CI 1.31-1.91) but not at older ages (> 75 years of age: RR 1.12, 95% CI 0.94-1.32). Mexican Americans also had a higher incidence of intracerebral hemorrhage and subarachnoid hemorrhage than non-Hispanic whites, adjusted for age.

Temporal trend data from the BASIC Project for the time period 2000 through 2010 demonstrated that ischemic stroke rates declined significantly in people aged =60 years but remained largely unchanged over time in those aged 45 to 59 years. Rates of decline did not differ significantly for non-Hispanic whites and Mexican Americans in any age group. Therefore, ethnic disparities in stroke rates in the 45- to 59-year-old and 60- to 74-year-old age groups persist (Morgenstern, et al., 2013).

Data from the most recent Greater Cincinnati Northern Kentucky Stroke Study (GCNKSS) show that compared with the 1990s, when incidence rates of stroke were stable, stroke incidence in 2005 was decreased for whites. A similar decline was not seen in blacks. These changes for whites were driven by a decline in ischemic strokes. There were no changes in incidence of ischemic stroke for blacks or of hemorrhagic strokes in blacks or whites (Kleindorfer, et al., 2010). In an analysis of temporal trends in ischemic stroke incidence stratified by age, the GCNKSS found an increased incidence of ischemic stroke over time for both blacks and whites aged 20 to 54 years, especially in 2005 compared with earlier time periods. There were declining incidence rates in the oldest age groups for both race groups (Kissela, et al., 2012).

Few studies have examined racial-ethnic disparities in stroke rehabilitation. Findings from the studies available are somewhat contradictory. With regard to access, a study from the Veterans Health Administration found no differences in referral to or receipt of inpatient rehabilitation (Horner RD, et al., 2003); however, another study found that urban-dwelling blacks or African Americans were more likely to be discharged from the hospital to inpatient rehabilitation facilities than whites (Gregory PC, et al, 2006). The VA study from Horner also reported that blacks or African Americans had a slightly longer time to initiation of rehabilitation that whites (4.4 days versus 3.8 days; $P<0.05$).

Other studies have evaluated the effect of the Functional Independence Measure (FIM) score on the admission of minorities to inpatient rehabilitation facilities. No consistency of findings has been noted. A retrospective cohort study from Bhandari, et al. (2005) found no racial differences in admission FIM scores, but several other studies reported significant differences. One large study involving urban participants hospitalized at a county hospital reported that Hispanics had lower FIM scores than blacks or African Americans (Chiou-Tan FY, et al, 2006). Another study reported similar findings with whites having the highest FIM scores (Ottenbacher KJ, et al., 2008).

Rehabilitation length of stay has been studied with similarly inconsistent findings. One study of VA and non-VA inpatient rehabilitation facilities reported significantly longer lengths of stay for blacks or African Americans than for whites (Stineman MG, 2001). Another study from CDC (2007) using data from the BRFSS found that blacks or African Americans were more likely to be referred to outpatient rehabilitation services than whites (adjusted OR 1.49; 95% CI 1.1 to 2.0).

Results on the delivery of outpatient occupational and physical therapy are also conflicting with some reporting that whites are more likely to receive therapy than non-white minorities (Mayer-Oakes SA, 1992). Another study utilizing data from the Health and Retirement Study found no racial differences among patients receiving occupational or physical therapy (Cook C, 2005). Studies from Bhandari (2005), as well as Horner (1997), reported no racial differences in the intensity of occupational or physical therapy delivered to minorities when compared to whites.

A more recently published study (Qian F, et al, 2013) from the American Heart Association/American Stroke Association Get With The Guidelines (GWTG)-Stroke program from April 2003 through December 2008, (n=200,900), found racial disparities related to length of hospitalization and functional status. After multivariable adjustment for both patient-level and hospital-level characteristics, compared with non-Hispanic white patients, non-Hispanic black and Hispanic patients were more likely to have a longer hospital stay (i.e., length of stay greater than 4 days; black: AOR, 1.30; 95% CI, 1.22-1.39; $P<0.001$; Hispanic: AOR, 1.12; 95% CI, 1.02-1.23; $P=0.02$) and less likely to be ambulatory independent at discharge (black: AOR, 0.81; 95% CI, 0.76-0.87; $P<0.001$; Hispanic: AOR, 0.89; 95% CI, 0.79-0.99; $P=0.04$). Furthermore, non-Hispanic black patients were less likely to have a death at admission (black: AOR, 0.78; 95% CI, 0.68 to 0.89; $P<0.001$) or to be discharged home (black: AOR, 0.87; 95%CI, 0.81-0.94; $P<0.001$). Data from the Paul Coverdell National Acute Stroke Registry (PCNASR) found that other races were somewhat more likely to be assessed for rehabilitation services (98.9%) when compared to non-Hispanic white patients (98.1%) (Centers for Disease Control and Prevention - Division for Heart Disease and Stroke Prevention, 2014).
