National Voluntary Consensus Standards for Nursing Homes 2010

Measure Number/Title: NH-018-10: Percent of Residents with a Urinary Tract Infection (Long Stay)

Description: This measure updates CMS' current QM on Urinary Tract Infections in the nursing facility populations. It is based on MDS 3.0 data and measures the percentage of long-stay residents who have a urinary tract infection on the target MDS assessment (which may be an annual, quarterly, or significant change or correction assessment). In order to address seasonal variation, the proposed measure uses a 6-month average for the facility. Long-stay nursing facility residents are those whose stay in the facility is over 100 days. The measure is limited to the long-stay population because short-stay residents (those who are discharged within 100 days of admission) may have developed their urinary tract infections in the hospital rather than the nursing facility.

<u>Numerator Statement:</u> The numerator is the number of long-stay nursing facility residents who have an annual, quarterly, or significant change or correction assessment during the selected time window with reported urinary tract infections in the last 30 days (Item I2300 of the MDS 3.0 is checked).

Denominator Statement: All MDS target assessments (which may be an annual, quarterly, significant change or significant correction assessment) over the last two quarters. The total number of assessments is then divided by two to report an average quarter count.

Level of Analysis: Population: national, Facility/Agency

Data Source: Electronic clinical data

Measure developer: Research Triangle Institute International

Measure Evaluation 4.1 December 2009

This form contains the measure information submitted by stewards. Blank fields indicate no information was provided. Attachments also may have been submitted and are provided to reviewers. The subcriteria and most of the footnotes from the evaluation criteria are provided in Word comments within the form and will appear if your cursor is over the highlighted area. Hyperlinks to the evaluation criteria and ratings are provided in each section.

TAP/Workgroup (if utilized): Complete all yellow highlighted areas of the form. Evaluate the extent to which each subcriterion is met. Based on your evaluation, summarize the strengths and weaknesses in each section.

Note: If there is no TAP or workgroup, the SC also evaluates the subcriteria (yellow highlighted areas).

Steering Committee: Complete all pink highlighted areas of the form. Review the workgroup/TAP assessment of the subcriteria, noting any areas of disagreement; then evaluate the extent to which each major criterion is met; and finally, indicate your recommendation for the endorsement. Provide the rationale for your ratings.

Evaluation ratings of the extent to which the criteria are met

C = Completely (unquestionably demonstrated to meet the criterion)

P = Partially (demonstrated to partially meet the criterion)

M = Minimally (addressed BUT demonstrated to only minimally meet the criterion)

N = Not at all (NOT addressed; OR incorrectly addressed; OR demonstrated to NOT meet the criterion)

NA = Not applicable (only an option for a few subcriteria as indicated)

(for NQF staff use) NQF Review #: NH-018-10 NQF Project: Nursing Homes 2010

MEASURE DESCRIPTIVE INFORMATION

De.1 Measure Title: Percent of Residents with a Urinary Tract Infection (Long Stay)

De.2 Brief description of measure: This measure updates CMS' current QM on Urinary Tract Infections in the nursing facility populations. It is based on MDS 3.0 data and measures the percentage of long-stay residents who have a urinary tract infection on the target MDS assessment (which may be an annual, guarterly, or significant change or correction assessment). In order to address seasonal variation, the proposed measure uses a 6-month average for the facility. Long-stay nursing facility residents are those whose stay in the facility is over 100 days. The measure is limited to the long-stay population because short-stay residents (those who are discharged within 100 days of admission) may have developed their urinary tract infections in the hospital rather than the nursing facility.

CONDITIONS FOR CONSIDERATION BY NQF

Four conditions must be met before proposed measures may be considered and evaluated for suitability as NQF Staff voluntary consensus standards: A. The measure is in the public domain or an intellectual property (measure steward agreement) is signed. Public domain only applies to governmental organizations. All non-government organizations must sign a measure steward agreement even if measures are made publicly and freely available. A.1 Do you attest that the measure steward holds intellectual property rights to the measure and the right to use aspects of the measure owned by another entity (e.g., risk model, code set)? Yes A.2 Indicate if Proprietary Measure (as defined in measure steward agreement):

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

TAP/Workgroup Reviewer Name: Steering Committee Reviewer Name: **1. IMPORTANCE TO MEASURE AND REPORT** Extent to which the specific measure focus is important to making significant gains in health care quality (safety, timeliness, effectiveness, efficiency, equity, patient-centeredness) and improving health outcomes for a specific high impact aspect of healthcare where there is variation in or overall poor performance. Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria) 1a. High Impact (for NQF staff use) Specific NPP goal: 1a.1 Demonstrated High Impact Aspect of Healthcare: Patient/societal consequences of poor quality 1a.2 **1a.3 Summary of Evidence of High Impact:** Nursing facility residents often develop infections. (1, 2, 3, 4, 5) and among these, urinary tract infections are the most common. (6, 7, 8) Some residents who develop urinary tract infections develop blood infections, and 10 percent of these patients die within a week. (9) Symptoms of urinary tract infections include fever, painful or difficult urination, increased frequency and urgency of

urination, blood in the urine, low abdominal or flank pain or tenderness, and deterioration in mental status (such as increased confusion). Using MDS 2.0 data for April-June 2009, the national prevalence of urinary tract infections in nursing facilities was 9.7%, with a range from a low average of 5.0% in Alaska to a high average of 14.3% in West Virginia. (10) The urinary tract infection quality measure is the only measure in the current measure set that addresses infections. Thus, the urinary tract infection quality measure is a very important indicator of how facilities prevent and manage infections. In a clinical review of the nursing home quality measures using the MDS 2.0, a Technical Expert Panel (TEP) organized by the University of Colorado concluded that the urinary tract infection quality measure is a

"valuable source of information for nursing homes." (11) The measure prompts facilities to examine their approach to perineal care and their general infection rate. These infections have the potential for significant

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

Comment [KP1]: 1a. The measure focus addresses:

•a specific national health goal/priority identified by NQF's National Priorities Partners; OR

 a demonstrated high impact aspect of healthcare (e.g., affects large numbers, leading cause of morbidity/mortality, high resource use (current and/or future), severity of illness, and patient/societal consequences of poor quality).

1a C P M N

Ev

al

Rat

ing

morbidity and mortality.(12, 13) Infections increase the use of medical care and costs. Since many urinary tract infections are related to catheters, this quality measure provides an additional incentive for the facility to monitor its catheter use.(14) Some urinary tract infections can be prevented by keeping the periurethral area clean, emptying the bladder regularly, drinking enough fluids, and practicing good hygiene.(15) Finding the cause and getting early treatment of a urinary tract infection can prevent the infection from spreading and becoming more serious or causing complications, such as delirium. In addition, some nursing facility residents are incorrectly diagnosed with urinary tract infections, thus leading to inappropriate use of antibiotics that can have adverse effects on older people as well as increase the presence of antibiotic resistant organisms.

1b.2 Summary of data demonstrating performance gap (variation or overall poor performance) across providers:

The urinary tract infection measure is part of the current Centers for Medicare & Medicaid Services (CMS) publicly reported quality measures for nursing homes. In its analysis of the quality measure using MDS data from 2006, the University of Colorado found variability across facilities in the rates of urinary tract infection, suggesting that it is possible for facilities to improve. (1) The nursing facility mean was 9.0 percent and the standard deviation was 5.4%. The quality measure varied from 2.6% at the 10th percentile to 16.2% at the 90th percentile; only 3.5% of facilities had no residents with urinary tract infections.

See attached Table 1: Measure Variability Across Facilities.

1b.3 Citations for data on performance gap:

1b.4 Summary of Data on disparities by population group:

Although research suggests racial disparities in quality of care in nursing homes between African Americans and whites (1, 2, 3, 4, 5) and between Hispanics and whites, (6), no analyses have been conducted specifically examining racial disparities in urinary tract infections. No research has been conducted on other types of disparities (e.g., ethnicity, rural/urban, or income) specifically for this measure.

1c. Outcome or Evidence to Support Measure Focus

1c.1 Relationship to Outcomes (For non-outcome measures, briefly describe the relationship to desired outcome. For outcomes, describe why it is relevant to the target population): The desired outcome is for a low percentage of nursing facility residents to have urinary tract infections. Currently, nearly 1 in 10 nursing home residents have a urinary tract infection.(1) Urinary tract infections can be uncomfortable and painful and can lead to serious complications such as sepsis, hospitalization, emergency department use, delirium and death. Increasing antimicrobial resistance increases the importance of preventing the infection as well as treating it.(2) As a result, policymakers, providers, and consumers want nursing facility residents to have fewer illnesses and infections, including urinary tract infections.

2. Gupta K, Hooten T, Stamm W. Increasing antimicrobial resistance and management of uncomplicated community acquired urinary tract infections. Ann Intern Med. 2001;135:41-50.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

Comment [k3]: 1 Examples of data on opportunity for improvement include, but are not limited to: prior studies, epidemiologic data, measure data from pilot testing or implementation. If data are not available, the measure focus is systematically assessed (e.g., expert panel rating) and judged to be a quality problem.

Comment [k4]: 1c. The measure focus is: •an outcome (e.g., morbidity, mortality, function, health-related quality of life) that is relevant to, or associated with, a national health goal/priority, the condition, population, and/or care being addressed; OR

of an intermediate outcome, process, structure, etc., there is evidence that supports the specific measure focus as follows: <u>oIntermediate outcome</u> - evidence that the measured intermediate outcome (e.g., blood pressure, Hba1c) leads to improved health/avoidance of harm or cost/benefit.

o<u>Process</u> - evidence that the measured clinical or administrative process leads to improved health/avoidance of harm and

if the measure focus is on one step in a multistep care process, it measures the step that has the greatest effect on improving the specified desired outcome(s).

o<u>Structure</u> - evidence that the measured structure supports the consistent delivery of effective processes or access that lead to improved health/avoidance of harm or cost/benefit.

o<u>Patient experience</u> - evidence that an association exists between the measure of patient experience of health care and the outcomes, values and preferences of individuals/ the public.

o<u>Access</u> - evidence that an association exists between access to a health service and the outcomes of, or experience with, care. o<u>Efficiency</u> - demonstration of an association between the measured resource use and level of performance with respect to one or more of the other five IOM aims of quality.

Comment [k5]: 4 Clinical care processes typically include multiple steps: assess \rightarrow identify problem/potential problem \rightarrow choose/plan intervention (with patient input) \rightarrow provide intervention \rightarrow evaluate impact on health status. If the measure focus is one step in such a multi-step process, the step with the greatest effect on the desired outcome should be selected as the focus of measurement. For example, although assessment of immunization status and recommending immunization are necessary steps, they are not sufficient to achieve the desired impact on health status patients must be vaccinated to achieve immunity. This does not preclude consideration of measures of preventive screening interventions where there is a strong link with desired outcomes (e.g. mammography) or measures for multiple care processes that affect a single outcome.

NQF #NH-I
1c.2-3. Type of Evidence: Evidence-based guideline, Randomized controlled trial, Observational study, Systematic synthesis of research, Expert opinion
1c.4 Summary of Evidence (as described in the criteria; for outcomes, summarize any evidence that
<i>healthcare services/care processes influence the outcome</i>): Urinary tract infections may lead to serious complications such as sepsis, hospitalization, emergency department use, delirium and death. Urinary tract infections are commonly treated with antibiotics and other medications to relieve the burning pain and urgent need to urinate and to prevent serious complications.(1, 2, 3, 4, 5, 6, 7,8) Treatment is usually successful. One study estimated that antibiotic therapy shortens the duration of symptoms and will probably cure more than 90% of infections.(5) Increasing antimicrobial resistance increases the importance of preventing the infection.(4, 5, 9)
An estimated 17% to 69% of all catheter-associated urinary tract infections may be preventable.(10) Use of catheters is associated with urinary tract infections.(11) Some urinary tract infections can be prevented by keeping the periurethral area clean, emptying the bladder regularly, drinking enough fluids, and practicing good hygiene.(11, 12) Finding the cause and getting early treatment of a urinary tract infection can prevent the infection from spreading and becoming more serious or causing complications, such as delirium. In addition, some nursing home residents are incorrectly diagnosed with urinary tract infections, thus leading to inappropriate use of antibiotics that can have adverse effects on older people and increase the presence of antibiotic resistant organisms.

11. Atkins D, Best D, Briss PA, et al. Grading quality of evidence and strength of recommendations. BMJ. 2004;336(7652):1049-51.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

Comment [k6]: 3 The strength of the body of evidence for the specific measure focus should be systematically assessed and rated (e.g., USPSTF grading system http://www.ahrq.gov/clinic/uspstf07/method s/benefit.htm). If the USPSTF grading system is explained including how it relates to the USPSTF grades or why it does not. However, evidence is not limited to quantitative studies and the best type of evidence depends upon the question being studied (e.g., randomized controlled trials appropriate for studying drug efficacy are not well suited for complex system changes). When qualitative studies are used, appropriate qualitative research criteria are used to judge the strength of the evidence.

Comment [k7]: USPSTF grading system http://www.ahrq.gov/clinic/uspstf/grades.ht m: A - The USPSTF recommends the service. There is high certainty that the net benefit is substantial. B - The USPSTF recommends the service. There is high certainty that the net benefit is moderate or there is moderate certainty that the net benefit is moderate to substantial. C - The USPSTF recommends against routinely providing the service. There may be considerations that support providing the service in an individual patient. There is at least moderate certainty that the net benefit is small. Offer or provide this service only if other considerations support the offering or providing the service in an individual patient. D - The USPSTF recommends against the service. There is moderate or high certainty that the service has no net benefit or that the harms outweigh the benefits. I - The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of the service. Evidence is lacking, of poor quality, or conflicting, and the balance of benefits and harms cannot be determined.

Comment [KP8]: 2a. The measure is well defined and precisely specified so that it can be implemented consistently within and across organizations and allow for comparability. The required data elements are of high quality as defined by NQF's Health Information Technology Expert Panel (HITEP).

NQF #NH-018-10 A0310A = 01 on the MDS. An OBRA admission assessment is required to be conducted within 14 days of admission 2a.11 Stratification Details/Variables (All information required to stratify the measure including the stratification variables, all codes, logic, and definitions): 2a.12-13 Risk Adjustment Type: No risk adjustment necessary 2a.14 Risk Adjustment Methodology/Variables (List risk adjustment variables and describe conceptual models, statistical models, or other aspects of model or method): 2a.15-17 Detailed risk model available Web page URL or attachment: 2a.18-19 Type of Score: Ratio 2a.20 Interpretation of Score: 2a.21 Calculation Algorithm (Describe the calculation of the measure as a flowchart or series of steps): Step 1: Determine the number of non-admission OBRA MDS 3.0 assessments (A0310A=02, 03, 04, 05, 06) for long-stay residents who have had a urinary tract infection in the last 30 days (item I2300 is checked on the MDS 3.0) during the last two quarters. Step 2: Determine the total number of non-admission, OBRA MDS 3.0 assessments (exclude those with A0310A = 01 (admission assessment) during the last two guarters). Step 3: Divide the result of Step 1 by the result of Step 2 and then divide the result by 2. 2a.22 Describe the method for discriminating performance (e.g., significance testing): Because the computed scores are not estimates, but include all residents who meet the measure criteria, in terms of discriminating performance, the computed scores can be used to make valid comparisons. 2a.23 Sampling (Survey) Methodology If measure is based on a sample (or survey), provide instructions for obtaining the sample, conducting the survey and guidance on minimum sample size (response rate): This is not applicable 2a.24 Data Source (Check the source(s) for which the measure is specified and tested) Electronic clinical data 2a.25 Data source/data collection instrument (Identify the specific data source/data collection instrument, e.g. name of database, clinical registry, collection instrument, etc.): The proposed data source is the Nursing Home Minimum Data Set (MDS) 3.0. 2a.26-28 Data source/data collection instrument reference web page URL or attachment: URL http://www.cms.hhs.gov/NursingHomeQualityInits/25 NHQIMDS30.asp#TopOfPage 2a.29-31 Data dictionary/code table web page URL or attachment: URL http://www.cms.hhs.gov/NursingHomeQualityInits/25_NHQIMDS30.asp#TopOfPage 2a.32-35 Level of Measurement/Analysis (Check the level(s) for which the measure is specified and tested) Population: national, Facility/Agency 2a.36-37 Care Settings (Check the setting(s) for which the measure is specified and tested) Nursing home (NH) /Skilled Nursing Facility (SNF) 2a.38-41 Clinical Services (Healthcare services being measured, check all that apply) TESTING/ANALYSIS 2b. Reliability testing 2b Ē ₽□ 2b.1 Data/sample (description of data/sample and size): Three major tests of the reliability of the urinary tract infection measure have been conducted. First, the MDS 2.0 measure items and the existing quality Μ measure were tested in the Data Assessment and Verification (DAVE 2) project conducted by Abt

---- (((|

Comment [KP10]: 2b. Reliability testing demonstrates the measure results are repeatable, producing the same results a high proportion of the time when assessed in the same population in the same time period.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

Ν

Associates.(1) This project used a nationwide sample of randomly selected nursing homes using MDS assessments for the period April 1 to December 31, 2006.(1) DAVE 2 performed 173 two-stage reviews.

Second, the University of Colorado used national facility-level quality measure data from 2003 Quarter 3 (Q3) through 2006 Q3 came from the Quality Improvement and Evaluation System (QIES) MDS Express Reports on the CMS intranet; Online Survey, Certification, and Reporting (OSCAR) data related to facility characteristics (e.g., state, resident census, number of beds, staffing) and certification survey results were downloaded from QIES Workbench. (2) A 10% random sample of all Medicare-certified nursing facilities was also downloaded from MDS assessment records. Analyses were based on complete MDS data from January 2005 through March 2006, as well as nearly complete data for April 2006 and partial data for May and June 2006.

Third, testing of the reliability of MDS 3.0 data items underlying the urinary tract infection quality measure as well as a comparison with the MDS 2.0 quality measures was conducted by RAND as part of the MDS 3.0 development process. (3) A representative sample of for-profit and not-for-profit facilities and hospital-based and free-standing facilities was recruited for the study, which included 71 community nursing homes in 8 states, 19 VA nursing homes, and 1,402 nursing home residents for the urinary tract infection quality measure.

2b.2 Analytic Method (type of reliability & rationale, method for testing):

Three sets of analytic methods were used. First, in the DAVE 2 Project, trained nurse reviewer selected a current resident with a recent assessment performed by the nursing home (NH) within the last 14 days.(1) In the first stage of this review, the nurse reviewer conducted a blind reassessment of the resident using standard MDS assessment and coding procedures (e.g., examination of the medical record; observation of the resident; interview of staff, resident, and family, and use of coding criteria). In the second stage of this assessment, the DAVE 2 nurse reviewer's assessment was compared to the corresponding nursing home assessment and each discrepancy was reconciled, with the nursing home assessor and the nurse reviewer agreeing on the appropriate response. In addition to data entering the facility MDS code, the DAVE 2 code, and the reconciled code into the MDS-QC data entry software, the DAVE 2 nurse reviewer entered a "reason code" to attribute the cause of the discrepancy, per MDS item reviewed, to an established list of reasons.

Second, in terms of measure stability, which is not exactly the same reliability but it a concept related to it, the University of Colorado examined the percentage of facilities that had a change in ranking from one quarter to the next of at least three deciles. (2) This indicator of stability was computed for each of the twelve pairs of adjacent quarters for which data were available (2003 Q3 through 2006 Q3).

Third, the national test of MDS 3.0 items examined agreement between assessors (reliability).(2) Quality Improvement Organizations (QIOs) were employed to identify gold-standard (research) nurses and recruit community nursing homes to participate in the national evaluation. The gold-standard nurses were trained in the MDS 3.0 instrument and, in turn, trained a facility nurse from each participating nursing home in their home states. Residents participating in the test were selected to capture a representative sample of short-and long-stay residents. Quality measures using the MDS 2.0I and the MDS 3.0 were calculated and then compared, with correlations and Kappas calculated.

Comment [k11]: 8 Examples of reliability testing include, but are not limited to: interrater/abstractor or intra-rater/abstractor studies; internal consistency for multi-item scales; test-retest for survey items. Reliability testing may address the data items or final measure score.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

	18-10	
http://www.cms.hhs.gov/NursingHomeQualityInits/Downloads/MDS30FinalReport.pdf.		
(b.3 Testing Results (reliability statistics, assessment of adequacy in the context of norms for the test		
conducted): Is part of the DAVE 2 project, Abt Associates used two methods to assess the reliability of the MDS 2.0 quality neasures. (1) First, for each MDS data element, the rate of discrepancies between the reconciled and original acility assessments has been reported. For urinary tract infection, the two-stage review discrepancy rate was '.4%. Second, Abt reported the rate of discrepancies between each quality measure, computed from facility lata, and its counterpart, computed from reconciled data. For urinary tract infection, the two-stage liscrepancy rate was 10.1%.		
econd, in terms of measure stability, the University of Colorado examined the percentage of facilities that and a change in ranking of at least three deciles from one quarter to the next.(2) For urinary tract infection, 10.4% of facilities had a three-decile-or-more change from one quarter to the next quarter. The range of tability measures across the 12 comparisons was very small (i.e., the difference between the maximum and ninimum values), indicating that measure stability is quite constant over time. For urinary tract infections, he minimum percentage was 29.9%, and the maximum percentage was 31.0%.		
hird, in their testing of the MDS 3.0, RAND compared the results on the nursing home quality measures using he MDS 3.0 and the MDS 2.0, both at the individual resident level and at the facility level. (3) At the resident evel, the urinary tract infection rate using the MDS 2.0 was 10.0% and using the MDS 3.0 was 7.5%; the Kappa vas 0.70 and the correlation was 0.71. Kappa is a statistical measure of inter-rater agreement for qualitative lata, ranging from 0.0 to 1.0. A rating of 0.70 is considered "substantial agreement." At the facility level, the MDS 2.0 rate of urinary tract infections was 10.2% and the MDS 3.0 rate was 7.3%, with a correlation of 0.80, which is quite high.

2c. Validity testing		 Comment [KP12]: 2c. Validity testing
cc.1 Data/sample <i>(description of data/sample and size):</i> Two studies examined the validity of the urinary ract infection measure. First, the analyses conducted by the University of Colorado used national facility-evel quality measure data from 2003 Q3 through 2006 Q3 came from the QIES MDS Express Reports on the CMS ntranet; OSCAR data related to facility characteristics (e.g., state, resident census, number of beds, staffing) ind certification survey results were downloaded from QIES Workbench.(1) A 10% random sample of all <i>M</i> edicare-certified nursing facilities was also downloaded from MDS assessment records. Analyses were based on complete MDS data from January 2005 through March 2006, as well as nearly complete data for April 2006 ind partial data for May and June 2006.		demonstrates that the measure reflects the quality of care provided, adequately distinguishing good and poor quality. If fac- validity is the only validity addressed, it is systematically assessed.
econd, in a study of the validity of the urinary tract infection quality measure, Stevenson, Moore and Sleeper ecruited 16 Idaho nursing homes to voluntary participate in a CMS-funded performance improvement project o reduce inappropriate antimicrobial prescribing for urinary tract infections from July 2001 to June 2002.(2)	2c C□	
. Brega A, Hittle D, Goodrich G, Kramer A, Conway K, Levy C. Empirical review of publicly reported nursing nome quality measures. Denver: Division of Health Care Policy and Research University of Colorado at Denver; hbt Associates, Inc, 2007.	P	

2. Stevenson KB, Moore JW, Sleeper B. Validity of the Minimum Data Set in identifying urinary tract infections in residents of long-term care facilities. J Am Geriatr Soc. 2007;52: 707-711.

2c.2 Analytic Method (type of validity & rationale, method for testing):

Construct validity using correlations and sensitivity analysis to evaluate whether UTI QM ratings are associated with other indicators of nursing home quality.

2c.3 Testing Results (statistical results, assessment of adequacy in the context of norms for the test conducted):

Two studies addressed the validity of the urinary tract infection measure. First, in an analysis by the University of Colorado, the urinary tract infection measure had correlations of 0.12 or less with other publicly reported nursing home quality measures.(1) The only correlation that was higher was 0.28 with indwelling catheter, which would be expected given that they both involve the urinary tract.

Second, in a study of 16 nursing homes in Idaho, researchers examined the validity of the MDS 2.0 urinary tract infection quality measure by comparing the MDS results to those of an active, prospective surveillance program in the facilities.(2) While almost all of the urinary tract infections were identified by the MDS, the measure also identified a substantial number of false positives. The estimated sensitivity (the proportion of residents listed with a urinary tract infection with an actual urinary tract infection disease) of the MDS was 57.9% and specificity (proportion of residents not listed as having a urinary tract infection that did not have a urinary tract infection) was 86.5%. Given the importance of infection control in nursing homes, it is preferable to cast a fairly wide net to identify all persons who need treatment and to motivate facilities to improve their practices.

2. Stevenson KB, Moore JW, Sleeper B. Validity of the Minimum Data Set in identifying urinary tract infections in residents of long-term care facilities. J Am Geriatr Soc. 2007;52: 707-711.

2d. Exclusions Justified

2d.1 Summary of Evidence supporting exclusion(s):

All assessments of long-stay residents for which complete data is available are included. Short-term, postacute care residents are not included because they are likely to have developed their urinary tract infection in the hospital rather than the nursing facility. Excluding missing data for existing quality measures is standard practice and was initially endorsed by NQF. Missing data is excluded from the calculation of the quality measures for several reasons. 1) There are legitimate reasons for facility staff not to select a 'dash' rather than a response; for example, if a resident is discharged or transferred abruptly, the staff may not be able to complete all items, however, an assessment is required for payment. The intent of the 'dash' is to allow the facility to submit an assessment when the staff are unable to complete the entire assessment. 2) Historically there has been very little missing data. For example, the current quality measure "Percent of residents who were physically restrained", is based on three fields on the MDS 3.0. For all of the non-admission target assessments for calendar year 2009, there were 5,242,022 such assessments and 629 assessments (0.012%) had a dash for one or more of the three fields for the physical restraint measure. 3) We remain concerned about a change in measure definition that may result in incentivizing the facility staff to fill in a response to avoid a missing item. We believe that the result will lead to decreased validity and usefulness of the measure.

2d.2 Citations for Evidence: This is not applicable.

2d.3 Data/sample (description of data/sample and size): This is not applicable.

2d.4 Analytic Method *(type analysis & rationale)*: This is not applicable.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

Comment [k13]: 9 Examples of validity testing include, but are not limited to: determining if measure scores adequately distinguish between providers known to have good or poor quality assessed by another valid method; correlation of measure scores with another valid indicator of quality for the specific topic; ability of measure scores to predict scores on some other related valid measure; content validity for multi-item scales/tests. Face validity is a subjective assessment by experts of whether the measure reflects the quality of care (e.g., whether the proportion of patients with BP < 140/90 is a marker of quality). If face validity is the only validity addressed, it is systematically assessed (e.g., ratings by relevant stakeholders) and the measure is judged to represent quality care for the specific topic and that the measure focus is the most important aspect of quality for the specific topic

Comment [KP14]: 2d. Clinically necessary measure exclusions are identified and must be: •supported by evidence of sufficient frequency of occurrence so that results are distorted without the exclusion; AND

•a clinically appropriate exception (e.g., contraindication) to eligibility for the measure focus; AND

precisely defined and specified:

 if there is substantial variability in exclusions across providers, the measure is specified so that exclusions are computable and the effect on the measure is transparent (i.e., impact clearly delineated, such as number of cases excluded, exclusion rates by type of exclusion);

if patient preference (e.g., informed decisionmaking) is a basis for exclusion, there must be evidence that it strongly impacts performance on the measure and the measure must be specified so that the information about patient preference and the effect on the measure is

transparent (e.g., numerator category computed separately, denominator exclusion category computed separately).

Comment [k15]: 10 Examples of evidence that an exclusion distorts measure results include, but are not limited to: frequency of occurrence, sensitivity analyses with and without the exclusion, and variability of exclusions across providers.

2d.5 Testing Results (e.g., frequency, variability, sensitivity analyses): This is not applicable.		
2e. Risk Adjustment for Outcomes/ Resource Use Measures		 Comment [KP16]: 2e. For outcome measures
2e.1 Data/sample (description of data/sample and size): This is not applicable.		and other measures (e.g., resource use) when indicated: •an evidence-based risk-adjustment strategy
2e.2 Analytic Method (type of risk adjustment, analysis, & rationale): This is not applicable.		(e.g., risk models, risk stratification) is specified and is based on patient clinical factors that influence the measured outcome (but not disparities in care) and are present at
2e.3 Testing Results (risk model performance metrics): This is not applicable.		start of care; ^{Error!} Bookmark not defined. OR rationale/data support no risk adjustment.
 2e.4 If outcome or resource use measure is not risk adjusted, provide rationale: The measure is not risk adjusted through a statistical model. However, the measure only applies to long-stay residents. The measure is limited to the long stay population because post-acute care patients may have developed their urinary tract infection in the hospital rather than the nursing facility. Urinary tract infections are a relatively high prevalence problem and there are no obvious conditions for which risk adjustment is appropriate. In particular, urinary tract infections are often associated with catheter use, which is often inappropriate.(1) Thus, risk adjusting for the proportion of residents who have catheters would not be desirable. 1. Gould CV, Umscheid CA, Agarwal R, Kuntz G, Pegues DA; the Healthcare Infection Control Practices Advisory Committee. Guideline for prevention of catheter-associated urinary tract infections 2009. Atlanta: Centers for Disease Control and Prevention, 2009. Available from http://www.cdc.gov/ncidod/dhqp/pdf/guidelines/CAUTI_Guideline2009final.pdf. 	2e C P M N N NA	Comment [k17]: 13 Risk models should not obscure disparities in care for populations by including factors that are associated with differences/inequalities in care such as race, socioeconomic status, gender (e.g., poorer treatment outcomes of African American men with prostate cancer, inequalities in treatment for CVD risk factors between men and women). It is preferable to stratify measures by race and socioeconomic status rather than adjusting out differences.
2f. Identification of Meaningful Differences in Performance		 Comment [KP18]: 2f. Data analysis
2f.1 Data/sample from Testing or Current Use <i>(description of data/sample and size)</i> : The measure is not risk adjusted through a statistical model. However, the measure only applies to long-stay residents. The measure is limited to the long-stay population because post-acute care patients may have developed their urinary tract infection in the hospital rather than the nursing facility. Urinary tract infections are a relatively high prevalence problem and there are no obvious conditions for which risk adjustment is appropriate. In particular, urinary tract infections are often associated with catheter use, which is often inappropriate.(1) Thus, risk adjusting for the proportion of residents who have catheters would not be desirable.		demonstrates that methods for scoring and analysis of the specified measure allow for identification of statistically significant and practically/clinically meaningful differences in performance.
1. Gould CV, Umscheid CA, Agarwal R, Kuntz G, Pegues DA; the Healthcare Infection Control Practices Advisory Committee. Guideline for prevention of catheter-associated urinary tract infections 2009. Atlanta: Centers for Disease Control and Prevention, 2009. Available from http://www.cdc.gov/ncidod/dhqp/pdf/guidelines/CAUTI_Guideline2009final.pdf.		
2f.2 Methods to identify statistically significant and practically/meaningfully differences in performance		 Comment [k19]: 14 With large enough sample sizes, small differences that are
(type of analysis & rationale): Because the computed scores are not estimates, but include all residents who meet the measure criteria, in terms of discriminating performance, the computed scores can be used to make valid comparisons.		statistically significant may or may not be practically or clinically meaningful. The substantive question may be, for example,
2f.3 Provide Measure Scores from Testing or Current Use <i>(description of scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance):</i> An analytical team at the University of Colorado Health Sciences Center examined the urinary tract infection rates at the facility level.(1) Below are the measure scores from testing or current use. For 13,836 facilities, the mean for the urinary tract infection measure was 9.0% and the standard deviation was 5.4%. The quality measure varied from 2.6% at the 10th percentile to 16.2% at the 90th percentile; only 3.5% of facilities had no resident with without infections.	2f C P	whether a statistically significant difference of one percentage point in the percentage of patients who received smoking cessation counseling (e.g., 74% v. 75%) is clinically meaningful; or whether a statistically significant difference of \$25 in cost for an episode of care (e.g., \$5,000 v. \$5,025) is practically meaningful. Measures with overall poor performance may not demonstrate much variability across providers.
residents with urinary tract infections. See attached Table 1: Measure Variability Across Facilities.	M

Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (evaluation criteria)	Ev al Rat ing
3a. Meaningful, Understandable, and Useful Information	
3a.1 Current Use: In use	
3a.2 Use in a public reporting initiative (disclosure of performance results to the public at large) (<i>If used in a public reporting initiative, provide name of initiative(s), locations, Web page URL(s). <u>If not publicly reported</u>, state the plans to achieve public reporting within 3 years): The urinary tract infection measure is available on the Nursing Home Compare Web site: http://www.medicare.gov/NHCompare/Include/DataSection/Questions/SearchCriteriaNEW.asp?version=defaul t&browser=IE%7C6%7CWinXP&language=English&defaultstatus=0&pagelist=Home&CookiesEnabledStatus=True</i>	
3a.3 If used in other programs/initiatives (<i>If used in quality improvement or other programs/initiatives, name of initiative(s), locations, Web page URL(s). <u>If not used for OI</u>, state the plans to achieve use for OI within 3 years): The Centers for Medicare & Medicaid Services expects that the urinary tract infection quality measure will be used by nursing homes as a tool to improve quality of care by keeping nursing home residents free of infections. Data on facility performance on the quality measures are also used by surveyors to identify problem areas when they inspect nursing homes.</i>	3a C P M N N
Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable	14

Comment [KP20]: 2g. If multiple data sources/methods are allowed, there is demonstration they produce comparable results.

Comment [KP21]: 2h. If disparities in care have been identified, measure specifications, scoring, and analysis allow for identification of disparities through stratification of results (e.g., by race, ethnicity, socioeconomic status, gender):OR rationale/data justifies why stratification is not necessary or not feasible.

Comment [KP22]: 3a. Demonstration that information produced by the measure is meaningful, understandable, and useful to the intended audience(s) for <u>both</u> public reporting (e.g., focus group, cognitive testing) <u>and</u> informing quality improvement (e.g., quality improvement initiatives). An important outcome that may not have an identified improvement strategy still can be useful for informing quality improvement by identifying the need for and stimulating new approaches to improvement.

Rating: C=Completely; P=Partially; M=Minimally; N=Not at all; NA=Not applicable

15

Comment [KP23]: 3b. The measure

specifications are harmonized with other measures, and are applicable to multiple levels and settings.

Comment [k24]: 16 Measure harmonization refers to the standardization of specifications for similar measures on the same topic (e.g., influenza immunization of patients in hospitals or nursing homes), or related measures for the same target population (e.g. eye exam and HbA1c for patients with diabetes), or definitions applicable to many measures (e.g., age designation for children) so that they are uniform or compatible, unless differences are dictated by the evidence. The dimensions of harmonization can include numerator, denominator, exclusions, and data source and collection instructions. The extent of harmonization depends on the relationship of the measures, the evidence for the specific measure focus, and differences in data sources

Comment [KP25]: 3c. Review of existing endorsed measures and measure sets demonstrates that the measure provides a distinctive or additive value to existing NOFendorsed measures (e.g., provides a more complete picture of quality for a particular condition or aspect of healthcare, is a more valid or efficient way to measure).

NQF #NH-0	18-10	
TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for Usability?	3	
Steering Committee: Overall, to what extent was the criterion, <i>Usability</i> , met? Rationale:	3 C P M N N	
4. FEASIBILITY		
Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. (evaluation criteria)	Ev al Rat ing	
4a. Data Generated as a Byproduct of Care Processes	4a	 Comment [KP26]: 4a. For clinical measures,
4a.1-2 How are the data elements that are needed to compute measure scores generated? Data generated as byproduct of care processes during care delivery (Data are generated and used by healthcare personnel during the provision of care, e.g., blood pressure, lab value, medical condition), Coding/abstraction performed by someone other than person obtaining original information (E.g., DRG, ICD-9 codes on claims, chart abstraction for quality measure or registry)	C P M N	required data elements are routinely generated concurrent with and as a byproduct of care processes during care delivery. (e.g., BP recorded in the electronic record, not abstracted from the record later by other personnel; patient self-assessment tools, e.g., depression scale; lab values, meds, etc.)
4b. Electronic Sources		 Comment [KP27]: 4b. The required data
 4b.1 Are all the data elements available electronically? (elements that are needed to compute measure scores are in defined, computer-readable fields, e.g., electronic health record, electronic claims) No 4b.2 If not, specify the near-term path to achieve electronic capture by most providers. 	4b C□ P□ M□ N	elements are available in electronic sources. If the required data are not in existing electronic sources, a credible, near-term path to electronic collection by most providers is specified and clinical data elements are specified for transition to the electronic health record.
 4c. Exclusions 4c.1 Do the specified exclusions require additional data sources beyond what is required for the numerator and denominator specifications? No 4c.2 If yes, provide justification. 		 Comment [KP28]: 4c. Exclusions should not require additional data sources beyond what is required for scoring the measure (e.g., numerator and denominator) unless justified as supporting measure validity.
4d. Susceptibility to Inaccuracies, Errors, or Unintended Consequences 4d.1 Identify susceptibility to inaccuracies, errors, or unintended consequences of the measure and describe how these potential problems could be audited. If audited, provide results. Issues regarding errors in using the urinary tract infection quality measure have been reported. However, the urinary tract infection measure is the only one in the existing measure set that addresses the critical issue of infections in nursing facilities. Moreover, as discussed earlier, changes to the manual for the MDS 3.0 will address many of the causes for errors by requiring more reliable evidence of urinary tract infection.(1, 2, 3, 4)		 Comment [KP29]: 4d. Susceptibility to inaccuracies, errors, or unintended consequences and the ability to audit the data items to detect such problems are identified.

4e. Data Collection Strategy/Implementation	
4e.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data/missing data, timing/frequency of data collection, patient confidentiality, time/cost of data collection, other feasibility/ implementation issues: The data collection method, the MDS, is already in operation and has been for many years.	
4e.2 Costs to implement the measure (<i>costs of data collection, fees associated with proprietary measures</i>): The data are collected as part of an existing, legally mandated process. There will be no additional costs to collect this information since it is already collected.	
4e.3 Evidence for costs: This is not applicable.	4e C
4e.4 Business case documentation: The proposed measure relies on data from the MDS 3.0. As there is no change in the data collection method for the MDS 3.0 as compared with its predecessor, the MDS 2.0, we do not anticipate any additional burden to nursing facilities. MDS 2.0, and soon to be MDS 3.0, data are collected as part of an existing, federally mandated process used for payment and quality monitoring purposes.	
TAP/Workgroup: What are the strengths and weaknesses in relation to the subcriteria for <i>Feasibility</i> ?	4
Steering Committee: Overall, to what extent was the criterion, <i>Feasibility</i> , met? Rationale:	4 C P M N
RECOMMENDATION	
(for NQF staff use) Check if measure is untested and only eligible for time-limited endorsement.	Tim e- limit ed
Steering Committee: Do you recommend for endorsement? Comments:	Y N N A

ADDITIONAL INFORMATION
Workgroup/Expert Panel involved in measure development
Ad.1 Provide a list of sponsoring organizations and workgroup/panel members' names and organizations.
Describe the members' role in measure development.
See attached Table 2: Nursing Home Quality Measures Technical Expert Panel (January 2009).
This technical expert panel met over 2 days in January 2009 to review an environmental scan of the current quality
measures and to make recommendations regarding their transition from MDS 2.0 to MDS 3.0.
Ad.2 If adapted, provide name of original measure: This measure was adapted from the measure of the same
name derived from MDS 2.0 data.
Ad.3-5 If adapted, provide original specifications URL or attachment

Measure #/Title/Steward NH-018-10: Percent of Residents with a Urinary Tract Infection (Long Stay)

(Centers for Medicare & Medicaid Services)

Description: This measure updates CMS' current QM on Urinary Tract Infections in the nursing facility populations. It is based on MDS 3.0 data and measures the percentage of long-stay residents who have a urinary tract infection on the target MDS assessment (which may be an annual, quarterly, or significant change or correction assessment). In order to address seasonal variation, the proposed measure uses a 6-month average for the facility. Long-stay nursing facility residents are those whose stay in the facility is over 100 days. The measure is limited to the long-stay population because short-stay residents (those who are discharged within 100 days of admission) may have developed their urinary tract infections in the hospital rather than the nursing facility.

Initial In-Person Vote:

Recommended for endorsement with conditions – 19 Not present - 1

Steering Committee Questions/Conditions for Measure Developer:	Response from Measure Developer
• Do not exclude patients with missing data	• The developer agreed to conduct an analysis of missing data as part of the validation analysis using the MDS 3.0 examining the extent of missing items, the impact of missing items on facility score and the impact of including vs. excluding patients with missing data on the facility score for the measure.
The definition of long-stay residents needs to be clarified	• Long-stay residents are defined as those greater than 100 days. Residents who return to the nursing home following a hospital discharge will not have their stay reset to zero.
