## National Voluntary Consensus Standards for Patient Outcomes Measure Summary

**Measure number: OT1-031-09**

**Measure name:** Proportion of Patients Hospitalized with Stroke that have a Potentially Avoidable Complication (during the Index Stay or in the 30-day Post-Discharge Period)

**Description:** Percent of adult population aged 18 – 65 years who were admitted to a hospital with stroke, were followed for one-month after discharge, and had one or more potentially avoidable complications (PACs). PACs may occur during the index stay or during the 30-day post discharge period (Please reference attached document labeled NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10.xls, tabs labeled CIP\_Index PAC\_Stays and CIP\_PAC\_Readmission). We define PACs during each time period as one of three types:

(A) PACs during the Index Stay (Hospitalization):

(1) PACs related to the anchor condition: The index stay is regarded as having a PAC if during the index hospitalization for stroke the patient develops one or more complications such as hypertensive encephalopathy, malignant hypertension, coma, anoxic brain damage, or respiratory failure etc. that may result directly from stroke or its management.

(2) PACs due to Comorbidities: The index stay is also regarded as having a PAC if one or more of the patient's controlled comorbid conditions is exacerbated during the hospitalization (i.e. it was not present on admission). Examples of these PACs are diabetic emergency with hypo- or hyperglycemia, pneumonia, lung complications, acute myocardial infarction, gastritis, ulcer, GI hemorrhage etc.

(3) PACs suggesting Patient Safety Failures: The index stay is regarded as having a PAC if there are one or more complications related to patient safety issues. Examples of these PACs are septicemia, meningitis, other infections, phlebitis, deep vein thrombosis, pulmonary embolism or any of the CMS-defined hospital acquired conditions (HACs).

(B) PACs during the 30-day post discharge period:

(1) PACs related to the anchor condition: Readmissions and emergency room visits during the 30-day post discharge period after a stroke are considered as PACs if they are for hypertensive encephalopathy, malignant hypertension, respiratory failure, coma, anoxic brain damage etc.

(2) PACs due to Comorbidities: Readmissions and emergency room visits during the 30-day post discharge period are also considered PACs if they are due to an exacerbation of one or more of the patient's comorbid conditions, such as a diabetic emergency with hypo- or hyperglycemia, pneumonia, lung complications, acute myocardial infarction, acute renal failure etc.

(3) PACs suggesting Patient Safety Failures: Readmissions or emergency room visits during the 30-day post discharge period are considered PACs if they are due to sepsis, infections, deep vein thrombosis, pulmonary embolism, or for any of the CMS-defined hospital acquired conditions (HACs).

# NATIONAL QUALITY FORUM

## National Voluntary Consensus Standards for Patient Outcomes Measure Summary

The enclosed workbook labeled NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10.xls, gives the frequency and costs associated with each of these types of PACs during the index hospitalization (tab labeled CIP\_Index PAC\_Stays) and for readmissions and emergency room visits during the 30-day post-discharge period (tab labeled CIP\_PAC\_Readmission). The information is based on a two-year national commercially insured population (CIP) claims database. The database had 4.7 million covered lives and \$95 billion in “allowed amounts” for claims costs. The database was an administrative claims database with medical as well as pharmacy claims. The two tabs demonstrate the most common PACs that occurred in patients hospitalized with stroke.

**Numerator statement:** Outcome: Potentially avoidable complications (PACs) in patients hospitalized for stroke occurring during the index stay or in the 30-day post-discharge period.

**Denominator statement:** Adult patients aged 18 – 65 years who had a relevant hospitalization for stroke (with no exclusions) and were followed for one-month after discharge.

**Level of Analysis:** Clinicians: Group, Population: states, Population: counties or cities, Health Plan, Population: national, Population: regional/network, Facility/Agency

**Type of Measure:** Outcome

**Data Source:** Electronic administrative data/claims, paper medical record/flowsheet

**Measure developer:** Bridges to Excellence

**Type of Endorsement: (full or time-limited):** Full Endorsement (Recommend-21, Do not Recommend-1, April 20-21, 2010 Meeting)

### **Summary table of TAP ratings of sub criteria and comments:**

IMPORTANCE TO MEASURE AND REPORT		
1a Impact	Completely	Similar to AMI measure but overall more cautious for stroke. Age is limited to <65 years – the majority of strokes occurs in the Medicare population; Are the PACs more avoidable in the younger population? Need to understand more about the causality and relationship of process and outcomes for stroke; some PACs, such as coma, seem to be “rarely avoidable”; What is the evidence –base that the PACs are improvable?
1b gap	Partial	
1c relation to outcomes	Partial	
SCIENTIFIC ACCEPTABILITY		
2a specs	Partial	Need more information on the selection of PACs – who was involved? What were the criteria? Concerns about the face validity. Agree with exclusions – age issue as noted above, though expanding to Medicare may involve end of life issues. Risk-adjustment – concern that factors are more financial than clinical
2b reliability	Partial	
2c validity	Minimal	
2d exclusions	Complete	
2e risk adjustment	Partial	

# NATIONAL QUALITY FORUM

## National Voluntary Consensus Standards for Patient Outcomes Measure Summary

2f meaningful differences	No information	and there doesn't seem to adjustment for severity of impairment - a limitation of the model. No information on how to interpret differences among hospitals.
2g comparability	Not applicable	
2h disparities	Not applicable	
<b>USEABILITY</b>		
3a distinctive	Partial	Useful for systems. Unclear how risk-adjustment affects results. Provides useful information on care transitions. Concerns on interpretation of results. What is the significance of including PACs of low frequency? – who knows what could be actionable – developer did not want to pre-judge. Question on whether we know enough to consider this a quality measure.
3b harmonization	Completely	
3c Added value	Completely	
<b>FEASIBILITY</b>		
4a Data a byproduct of care	Partial	See AMI measure
4b Electronic	Completely	
4c Exclusions	Completely	
4d Inaccuracies/errors	Completely	
4e Implementation	Completely	

### **Summary of SC ratings of sub criteria and comments:**

<b>IMPORTANCE TO MEASURE AND REPORT</b>	
N/A	<p>SC Vote on Importance</p> <p>Yes - 20</p> <p>No - 2</p>
<b>SCIENTIFIC ACCEPTABILITY</b>	
The Committee noted that Cardiovascular TAP members had concerns about some PACs – particularly the inclusion of coma as it is not always avoidable. The developer advised they are reviewing the PACs with their experts advisors but if a PAC is preventable only 1% of the time, it is included since it was viewed as an opportunity for improvement.	<p>SC vote on scientific acceptability</p> <p>Completely - 4</p> <p>Partially – 17</p> <p>Minimally – 0</p> <p>Not at all – 0</p>
<b>USABILITY</b>	
N/A	SC vote on usability

<b>FEASIBILITY</b>	
N/A	SC vote on feasibility Completely - 4 Partially – 17 Minimally – 0 Not at all – 0

**Summary of Biostatistical review:**

<p>Type of Risk Model :</p> <p><i>It was not clear to me if the proposed measure is risk-adjusted. The developers did extensive modeling for the purpose of determining evidence-informed case rates. It is not clear whether/how these models are intended to be used for risk-adjusting PAC rates.</i></p>
<p><b>RISK FACTORS</b></p> <p>Are the risk factors clearly identified in the submission information? <i>See above.</i></p>
<p>Does the model include risk factors associated with differences/inequalities with care such as race, socioeconomic status or gender? <i>N/A. See above.</i></p>
<p>Are the conceptual and quantitative criteria for inclusion or exclusion or combining of risk factors explained and appropriate?</p> <p><i>Conceptual and quantitative considerations were described in detail for models estimating the costs of episodes with and without PACs. I am not sure how these models relate to the goal of analyzing risk-adjusted PAC rates.</i></p>
<p>Is quantitative assessment of the relative contribution of the model components described in detail?</p> <p><i>N/A. See above.</i></p>
<p>Does the measure have exclusions that influence outcomes that should be included as risk factors?</p>

# NATIONAL QUALITY FORUM

## National Voluntary Consensus Standards for Patient Outcomes Measure Summary

*The documentation mentions that patients are excluded if they have any form of cancer, ESRD (end-stage renal disease), transplants such as lung or heart-lung transplant or complications related to transplants, pregnancy and delivery, HIV, or suicide. These seem to be reasonable exclusions.*

Comments on risk factors:

- 1. The risk adjustment model described in the measure submission was designed to predict cost. Although PAC's are a key driver of cost, it is unclear whether the same risk factors would be optimal for predicting PAC as a binary (yes/no) endpoint.*
- 2. If I am reading correctly, some of the variables used for estimating costs are care processes delivered during the index hospitalization. (e.g. noninvasive cardiovascular procedures, etc.) For analyzing and comparing PAC rates, it would be appropriate to adjust only for patient factors that were present at the beginning of the episode, and not adjust for the interventions given during the episode.*
- 3. It is not clear what methods were used to distinguish pre-existing conditions (present on admission) from complications that occurred during the index hospitalization.*

### **VALIDATION OF THE RISK MODEL**

Is there information provided on the cross-validation of the model comparing a development sample and a validation sample provided? *N/A*

Is there information on independent, external validation of the model in another data set? *N/A*

Are the results supportive of a valid model? *N/A*

*See comments above.*

### **RISK MODEL PERFORMANCE (2e)**

DISCRIMINATION: *N/A*

Does the statistic support good discrimination? *N/A*

CALIBRATION: Is a calibration curve included? *NO*

Is a risk decile plot included? *NO*

Hosmer-Lemeshow statistic: *NO*

Does the data support good model calibration? *N/A*

Comments on Risk Model Performance:

### **Reliability testing (2b):**

Is the reliability of the key data elements, such as risk factors and the outcome demonstrated? *NO*

Is there information about the reliability of the measure score, such as signal to noise ratio? *NO*

Has a sensitivity analysis been performed for problem or missing data? *NO*

Does the data demonstrate that the risk model is reliable? *N/A. See above.*

Comments on reliability testing:

# NATIONAL QUALITY FORUM

## National Voluntary Consensus Standards for Patient Outcomes Measure Summary

*No formal reliability testing was done. The developers report that analyses were repeated in two different databases and that the percentages of AMI patients experiencing PACs in these databases were 61% and 62%, compared to 58% in the national claims database used to determine the PAC measure.*

### **Validity testing (2c):**

Is validity testing of the measure to demonstrate results can be used to make conclusions about quality provided? *NO*

Are the results supportive of a valid measure? *N/A.*

Comments on validity testing:

*The measure relies on claims data to identify complications. How are complications distinguished from comorbidities? Does the algorithm require present-on-admission flags? If so, are these flags used consistently by all of the units in the analysis? A possible concern is that observed differences may reflect differences in coding practices rather than true differences in outcomes. Were any steps taken to investigate coding consistency?*

### **Scoring Method Justification (2f):**

Is the choice of method for computing risk-adjusted scores and identifying statistically significant differences justified? *N/A.*

Comments on scoring methods:

### **Summary comments:**

*The measure developers did extensive analyses to account for case mix when determining evidence-informed case rates. However, it does not appear that an adjustment for case mix is being proposed for the analysis and reporting of PAC rates. The methodology description states: "PAC rates are calculated as absolute not relative values. For example, a health plan would report that 60% of its plan members with stroke incurred PACs in the study time window." This leads me to believe the measure is not risk-adjusted.*

## Measure Evaluation 4.1 January 2010

This form contains the measure information submitted by stewards. Blank fields indicate no information was provided. Attachments also may have been submitted and are provided to reviewers. The sub-criteria and most of the footnotes from the [evaluation criteria](#) are provided in Word comments and will appear if your cursor is over the highlighted area (or in the margin if your Word program is set to show revisions in balloons). Hyperlinks to the evaluation criteria and ratings are provided in each section.

**TAP/Workgroup** (if utilized): Complete all **yellow highlighted** areas of the form. Evaluate the extent to which each sub-criterion is met. Based on your evaluation, summarize the strengths and weaknesses in each section.

**Note:** *If there is no TAP or workgroup, the SC also evaluates the sub-criteria (yellow highlighted areas).*

**Steering Committee:** Complete all **pink** highlighted areas of the form. Review the workgroup/TAP assessment of the sub-criterion, noting any areas of disagreement; then evaluate the extent to which each major criterion is met; and finally, indicate your recommendation for the endorsement. Provide the rationale for your ratings.

Evaluation ratings of the extent to which the criteria are met

C = Completely (unquestionably demonstrated to meet the criterion)

P = Partially (demonstrated to partially meet the criterion)

M = Minimally (addressed BUT demonstrated to only minimally meet the criterion)

N = Not at all (NOT addressed; OR incorrectly addressed; OR demonstrated to NOT meet the criterion)

NA = Not applicable (only an option for a few sub-criteria as indicated)

(for NQF staff use) NQF Review #: OT1-031-09

NQF Project: Patient Outcomes Measures: Phases I and II

### MEASURE DESCRIPTIVE INFORMATION

**De.1 Measure Title:** Proportion of Patients Hospitalized with Stroke that have a Potentially Avoidable Complication (during the Index Stay or in the 30-day Post-Discharge Period)

**De.2 Brief description of measure:** Percent of adult population aged 18 - 65 years who were admitted to a hospital with stroke, were followed for one-month after discharge, and had one or more potentially avoidable complications (PACs). PACs may occur during the index stay or during the 30-day post discharge period (Please reference attached document labeled NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10.xls, tabs labeled CIP\_Index PAC\_Stays and CIP\_PAC\_Readmission). We define PACs during each time period as one of three types:

(A) PACs during the Index Stay (Hospitalization):

(1) PACs related to the anchor condition: The index stay is regarded as having a PAC if during the index hospitalization for stroke the patient develops one or more complications such as hypertensive encephalopathy, malignant hypertension, coma, anoxic brain damage, or respiratory failure etc. that may result directly from stroke or its management.

(2) PACs due to Comorbidities: The index stay is also regarded as having a PAC if one or more of the patient's controlled comorbid conditions is exacerbated during the hospitalization (i.e. it was not present on admission). Examples of these PACs are diabetic emergency with hypo- or hyperglycemia, pneumonia, lung complications, acute myocardial infarction, gastritis, ulcer, GI hemorrhage etc.

(3) PACs suggesting Patient Safety Failures: The index stay is regarded as having a PAC if there are one or more complications related to patient safety issues. Examples of these PACs are septicemia, meningitis, other infections, phlebitis, deep vein thrombosis, pulmonary embolism or any of the CMS-defined hospital acquired conditions (HACs).

(B) PACs during the 30-day post discharge period:

<p>(1) PACs related to the anchor condition: Readmissions and emergency room visits during the 30-day post discharge period after a stroke are considered as PACs if they are for hypertensive encephalopathy, malignant hypertension, respiratory failure, coma, anoxic brain damage etc.</p> <p>(2) PACs due to Comorbidities: Readmissions and emergency room visits during the 30-day post discharge period are also considered PACs if they are due to an exacerbation of one or more of the patient’s comorbid conditions, such as a diabetic emergency with hypo- or hyperglycemia, pneumonia, lung complications, acute myocardial infarction, acute renal failure etc.</p> <p>(3) PACs suggesting Patient Safety Failures: Readmissions or emergency room visits during the 30-day post discharge period are considered PACs if they are due to sepsis, infections, deep vein thrombosis, pulmonary embolism, or for any of the CMS-defined hospital acquired conditions (HACs).</p> <p>The enclosed workbook labeled NQF_Stroke_PACs_Risk_Adjustment_2.16.10.xls, gives the frequency and costs associated with each of these types of PACs during the index hospitalization (tab labeled CIP_Index PAC_Stays) and for readmissions and emergency room visits during the 30-day post-discharge period (tab labeled CIP_PAC_Readmission). The information is based on a two-year national commercially insured population (CIP) claims database. The database had 4.7 million covered lives and \$95 billion in “allowed amounts” for claims costs. The database was an administrative claims database with medical as well as pharmacy claims. The two tabs demonstrate the most common PACs that occurred in patients hospitalized with stroke.</p>
<p>1.1-2 Type of Measure: <a href="#">outcome</a></p> <p>De.3 If included in a composite or paired with another measure, please identify composite or paired measure <a href="#">Not Applicable</a></p>

CONDITIONS FOR CONSIDERATION BY NQF	
Four conditions must be met before proposed measures may be considered and evaluated for suitability as voluntary consensus standards:	<b>NQF Staff</b>
<p>A. The measure is in the public domain or an intellectual property (<a href="#">measure steward agreement</a>) is signed. <i>Public domain only applies to governmental organizations. All non-government organizations must sign a measure steward agreement even if measures are made publicly and freely available.</i></p> <p>A.1 Do you attest that the measure steward holds intellectual property rights to the measure and the right to use aspects of the measure owned by another entity (e.g., risk model, code set)? <a href="#">Yes</a></p> <p>A.2 Indicate if Proprietary Measure (as defined in measure steward agreement):</p> <p>A.3 Measure Steward Agreement: <a href="#">agreement signed and submitted</a></p> <p>A.4 Measure Steward Agreement attached: <a href="#">BTE NQFMeasureStewardAgreement_10-30-2009-634007983344803176.pdf</a></p>	<p>A</p> <p>Y <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p>B. The measure owner/steward verifies there is an identified responsible entity and process to maintain and update the measure on a schedule that is commensurate with the rate of clinical innovation, but at least every 3 years. <a href="#">Yes, information provided in contact section</a></p>	<p>B</p> <p>Y <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p>C. The intended use of the measure includes <u>both</u> public reporting <u>and</u> quality improvement. ► <b>Purpose:</b> <a href="#">public reporting, quality improvement Payment Incentive, Accountability</a></p>	<p>C</p> <p>Y <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p>D. The requested measure submission information is complete. Generally, measures should be fully developed and tested so that all the evaluation criteria have been addressed and information needed to evaluate the measure is provided. Measures that have not been tested are only potentially eligible for a time-limited endorsement and in that case, measure owners must verify that testing will be completed within 12 months of endorsement. D.1 Testing: <a href="#">Yes, fully developed and tested</a></p>	<p>D</p> <p>Y <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>

D.2 Have NQF-endorsed measures been reviewed to identify if there are similar or related measures? Yes	
(for NQF staff use) Have all conditions for consideration been met? Staff Notes to Steward (if submission returned):	Met Y <input type="checkbox"/> N <input type="checkbox"/>
Staff Notes to Reviewers (issues or questions regarding any criteria):	
Staff Reviewer Name(s):	

TAP/Workgroup Reviewer Name:	
Steering Committee Reviewer Name:	
<b>1. IMPORTANCE TO MEASURE AND REPORT</b>	
Extent to which the specific measure focus is important to making significant gains in health care quality (safety, timeliness, effectiveness, efficiency, equity, patient-centeredness) and improving health outcomes for a specific high impact aspect of healthcare where there is variation in or overall poor performance. <i>Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria. (evaluation criteria)</i> 1a. High Impact	Eval Rating
(for NQF staff use) <u>Specific NPP goal:</u>	
<p><b>1a.1 Demonstrated High Impact Aspect of Healthcare:</b> high resource use, affects large numbers, a leading cause of morbidity/mortality, severity of illness, patient/societal consequences of poor quality</p> <p><b>1a.2</b></p> <p><b>1a.3 Summary of Evidence of High Impact:</b> Stroke is the third leading cause of death in the U.S. and accounts the largest number of hospitalizations for neurological disease. During 2000, a total of 445,452 hospitalizations among Medicare enrollees were attributed to stroke, resulting in an age-adjusted rate of 16.3 per 1,000 enrollees. Stroke hospitalization rates increased with age and were higher among men than women and among blacks than whites. Patients who have had a stroke are at a high risk of stroke recurrence (rates of recurrence range from 4-14% annually). Control of risk factors and stroke prevention therapy can reduce the likelihood of recurrence.</p> <p>A significant portion of waste in today's healthcare system is due to "care defects" - errors, avoidable hospitalizations, and other process failures that cause patients to incur unnecessary services and some harm. The June 2007 MedPAC report to Congress on "Promoting Greater Efficiency in Medicare" highlighted the fact that in 2005, \$12 billion were spent on potentially preventable readmissions alone within 30 days of discharge from the hospital. Another study by Jencks and colleagues found that roughly 19.6% of Medicare patients incurred re-hospitalizations within 30 days of discharge. When hospitalizations do occur, they must be managed expeditiously and readmissions following discharge should be avoided.</p> <p>Hospital acquired conditions (HACs) have been defined by the Centers for Medicare and Medicaid (CMS) under the proposed rules for 2008 and 2009. Other potentially avoidable complications have been suggested by AHRQ's patient safety indicators (PSIs).</p> <p>In her address at the Healthcare Incentives Institute, Oct 2008, Anne Mutti from MedPAC emphasized the need for bundled payments to a single entity, to cover hospitalizations plus some time after discharge (e.g. 30 days), to motivate providers to collaborate with partners to improve collective performance and reduce the unnecessary costs of avoidable readmissions.</p> <p><b>1a.4 Citations for Evidence of High Impact:</b> 1. **1b. Opportunity for Improvement**

**1b.1 Benefits (improvements in quality) envisioned by use of this measure:** Accountability for and measurement of PACs occurs at the practice, medical group, provider system or purchaser/payer level, not for an individual physician’s performance. PAC rates are calculated as absolute not relative values. For example, a health plan would report that 60% of its plan members with Stroke incurred PACs in the study time window. The objective of the measure is to encourage the unit being measured to progressively reduce that amount, not to discriminate performance between two units being measured.

Comparisons of PAC rates across plans or provider systems is appropriate and these organizations should be encouraged to publicly report their PAC rates. Once the PAC rates have been measured, the automated SAS programs have the capability to let the users drill down to the patient level and identify the leading causes of PACs as well as do regional variation and provider group level analysis. This makes the data actionable. There are several tools available for provider systems and health plans to impact PAC rates. These include care coordination across care settings, post-discharge planning and patient follow-up, active care management, sharing medical record data between care settings and providers, total quality management within hospitals and active reduction of patient safety failures.

Reducing PACs has the potential to significantly improve the overall level of quality, and creating a single measure of accountability for physicians and hospitals tied to gaps in quality, and a measure of accountability for health plans to improve the ways in which they engage patients in more optimal care management and coordination, is likely to yield much improved outcomes for patients.

**1b.2 Summary of data demonstrating performance gap (variation or overall poor performance) across providers:**

Even though hospitalizations for stroke should be potentially avoidable in their own right; once they do occur, the index stay itself may have a potentially avoidable complication (PAC) or patients may develop a PAC during the 30-day post-discharge period. Stroke recurrence within the 30-day post-discharge period was related to hypertension, especially in those with a high diastolic pressure of >100 mmHg, diabetes with blood glucose > 140 mg/dl (Sacco et.al). PACs lead to significant variability in outcomes including prolonged hospitalizations, readmissions and emergency room visits, all indicating poor outcomes that harm the patient, cause payers to incur unnecessary costs and could be improved by providers.

The measure assesses the proportion of patients hospitalized for stroke that had a PAC. In the national claims database used to determine the PAC measure, 58% of them had at least one PAC related to Stroke. A geographical variation analysis demonstrated that across the 50 states in the country, the percent of patients having at least one potentially avoidable complication in Stroke patients varied from 38% in Louisiana to 71% in Delaware.

Similarly, running the same analysis on two separate databases demonstrated that the proportion of Stroke

1b  
 C   
 P   
 M   
 N

patients having one or more PACs was 61% and 62% respectively. While PACs might not be completely eliminated, identifying their magnitude and understanding their causality, in particular for the most frequent or the most expensive, could lead to improving patient outcomes.

**1b.4 Summary of Data on disparities by population group:**

Not Applicable

**1b.5 Citations for data on Disparities:**

Not Applicable

**1c. Outcome or Evidence to Support Measure Focus**

**1c.1 Relationship to Outcomes** (*For non-outcome measures, briefly describe the relationship to desired outcome. For outcomes, describe why it is relevant to the target population*): Hospital acquired conditions (HACs) have been defined by the Centers for Medicare and Medicaid (CMS) under the proposed rules for 2008 and 2009 and are avoidable conditions in hospitalized patients. Our potentially avoidable complications (PACs) go beyond the CMS defined HACs and identify conditions related to the index condition, to comorbidities that got exacerbated, as well as those related to patient safety failures. While there is a general understanding of the nature of care failures during hospitalizations or post-discharge such as readmissions and emergency room visits, there has been no attempt to measure the magnitude or the type of potentially avoidable complications, and the cost reductions that would ensue if a payment model encouraged care to be optimized at benchmarks achieved in studies.

Well-managed patients with stroke should rarely incur a potentially avoidable complication such as an emergency room visit post-discharge, and readmissions related to stroke should occur only in the rarest of circumstances. The enclosed workbook entitled NQF\_Stroke\_PACs\_Risk\_Adjustment 2.16.10.xls lists the types of PACs, their frequency and costs as calculated in our national database, for both the inpatient stays and readmissions (see tabs CIP\_Index\_PAC\_Stays and CIP\_PAC\_Readmissions). The PAC Overview tab shows that 57.8% of all hospitalizations for stroke had a PAC, with 53% of index stays having a PAC during the initial hospitalization. Of these PACs, over 18.5% were incurred for direct complications of stroke, another 47% for acute exacerbation of a comorbidity, and another 34.4% due to patient safety failures such as sepsis and other widespread infections, complications of surgical procedures, phlebitis and deep vein thrombosis or CMS-defined hospital acquired conditions. The primary cause for readmissions and emergency room visits during the 30-day post-discharge period was due to a hypertensive encephalopathy, diabetic emergency with hypo- or hyperglycemia, pneumonia or lung complications, or patient safety failures such as skin or wound infections or sepsis. The ability to clearly identify the type and frequency of each PAC creates a

highly actionable measure for all providers that are managing or co-managing the patient, as well as for the health plan with whom the patient is a member.

**1c.2-3. Type of Evidence:** observational study, randomized controlled trial

**1c.4 Summary of Evidence** (*as described in the criteria; for outcomes, summarize any evidence that healthcare services/care processes influence the outcome*):

A study from the Boston Medical Center, Boston MA, demonstrated that although one in five hospitalizations are complicated by post-discharge adverse events, development of a strong discharge services program for patients admitted for medical conditions reduced hospital utilization within 30 days of discharge.

Patients who have had a stroke are at a high risk of stroke recurrence (rates of recurrence range from 4-14% annually). Stroke recurrence within the 30-day post-discharge period was related to hypertension, especially in those with a high diastolic pressure of >100 mmHg, diabetes with blood glucose > 140 mg/dl (Sacco et.al). Control of risk factors and stroke prevention therapy can reduce the likelihood of recurrence. Additionally, pharmacological management with antihypertensive drugs has been shown to reduce the incidence of all strokes in men by 34% and in women by 38%. However, data from NHANES-III suggest that roughly half of patients taking antihypertensive drugs achieve blood pressure levels at or below the treatment goal of 140/90 mm Hg. Using data from a population-base case control study, one report found that achieving control of blood pressure among pharmacologically treated hypertensive patients might prevent 57% of hemorrhagic and 27% of ischemic strokes.

A study published in 2006 (Stoeckle-Roberts et al) demonstrated that a collaborative and systematic approach led to significant quality improvements for 5 of the 16 measures for acute stroke care. While most of the quality measures used in that study were process measures such as smoking cessation, dysphagia screening, use of recombinant tissue plasminogen activator (rt-PA), they are the fore-runners that lead to PACs.

Umscheid et al used 2002 estimates of hospital-acquired infections (HAI) and determined the range of HAI risk reductions from US studies. They report that 18%-82% of blood-stream infections, 46%-55% of ventilator associated pneumonia, 17% - 69% of urinary tract infections and 26%-54% of surgical site infections are preventable. Healy et al analyzed complications in hospitalized surgical patients and reported that between 39% and 61% of major complications (wound infections, pneumonia, urinary tract infections, arrhythmias, respiratory failure, gastrointestinal complications, deep vein thrombosis) and about an equal percent of minor complications could have been avoided. The National Pressure Ulcer Advisory Panel (NPUAP) reported in 2001 that pressure ulcer prevention programs had reported 50% or greater reductions in facility-acquired pressure ulcers. Similarly, appropriate prophylaxis could reduce the risk of venous thromboembolism by 45% in acutely ill medical patients, and a recent study found a 50% reduction in thromboembolic events with extended pharmacologic prophylaxis. Adequate evidence-based treatment protocols in preventing contrast nephropathy and adequate drug dosing have demonstrated a risk reduction between 52% and 90% in the incidence of acute renal failure in patients in the intensive care unit. Additionally, use of electronic medical systems has demonstrated that in a sample hospital that used prompts for protocols for nursing care, infection rates dropped 88%, bedsores were reduced and compliance to guidelines for care of patients on ventilator increased by 77%.

**1c.5 Rating of strength/quality of evidence** (*also provide narrative description of the rating and by whom*):

Moderately High - based on studies cited

**1c.6 Method for rating evidence:** While most of the studies cited above are observational, one randomized controlled study did demonstrate that development of strong discharge services reduced readmissions and emergency room visits. Additionally, the patient management tool (PMT) used by the partnership between the Paul Coverdell National Acute Stroke Registry investigators and the American Stroke Association suggested that clinically and statistically significant improvements can be made in acute stroke care using a collaborative and systematic approach to QI that employs protocol utilization and ongoing data collection

and review as part of an organized PMT. The available evidence from well-designed, well-conducted studies suggests that care processes have a potential to influence outcomes and this conclusion is unlikely to be strongly affected by the results of future studies.

**1c.7 Summary of Controversy/Contradictory Evidence:** None

<p><b>2a.1 Numerator Statement</b> (<i>Brief, text description of the numerator - what is being measured about the target population, e.g. target condition, event, or outcome</i>):  Outcome: Potentially avoidable complications (PACs) in patients hospitalized for stroke occurring during the index stay or in the 30-day post-discharge period.</p> <p><b>2a.2 Numerator Time Window</b> (<i>The time period in which cases are eligible for inclusion in the numerator</i>):  The time window starts with a hospitalization for stroke and continues for one month after discharge.</p> <p><b>2a.3 Numerator Details</b> (<i>All information required to collect/calculate the numerator, including all codes, logic, and definitions</i>):  Patients that had an index hospitalization for stroke, and were identified as having services for potentially avoidable complications (PACs) either during the index hospitalization or within one month after discharge from the index hospitalization.  The enclosed excel workbook entitled NQF_Stroke_all_codes_1.22.10 gives the detailed codes for PACs. Services for PACs are identified as follows:  a. In the EXPND Stroke TRGS tab, claims with ICD-9 diagnosis codes, ICD-9 procedure codes or CPT codes marked with an assignment PAC in column B.  b. In the medical tab, claims with ICD-9 diagnosis codes that map to one of the CCS diagnosis categories identified as a "1" in column E (labeled Stroke PAC)  c. In the proc tab, claims with either ICD-9 procedure codes or CPT codes that map to one of the CCS procedure categories identified as a "1" in column D (labeled Stroke PAC)  d. In the Pharm tab, pharmacy claims that map to a category identified as a PAC in the Stroke Action Descr column</p> <p>These claims are included as PACs only if the PAC is NOT present on admission AND the claims are considered as relevant to Stroke. Relevant claims are defined as claims that:  a. Have a "filter code" on the claim - see tab entitled "EXPND Stroke TRGS" - all codes with an assignment as typical or PAC in the enclosed worksheet are filter codes. One of these codes needs to be present on a claim to be included as relevant to the episode, AND  b. Do not have an exclusion code. Exclusion codes for numerator are defined in the same fashion as in the Denominator Exclusion section.</p> <p>For the CCS category mapping to ICD-9 diagnosis codes see tab named CCSDX (This gives the AHRQ Clinical Classification System to categorize ICD-9 diagnosis codes into AHRQ diagnosis categories)  For the CCS category mapping to ICD-9 procedure codes see tab named CCSPX (This gives the AHRQ Clinical Classification System to categorize ICD-9 procedure codes into AHRQ procedure categories)  For the CCS category mapping to CPT codes see tab named CCSCPT ((This gives the AHRQ Clinical Classification System to categorize CPT codes into the same AHRQ procedure categories as for ICD-9 codes)</p>	
<p><b>2a.4 Denominator Statement</b> (<i>Brief, text description of the denominator - target population being measured</i>):  Adult patients aged 18 - 65 years who had a relevant hospitalization for stroke (with no exclusions) and were followed for one-month after discharge.</p> <p><b>2a.5 Target population gender:</b> Female, Male</p>	<p>2a- specs C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/></p>

**2a.6 Target population age range:** 18 - 65 years

**2a.7 Denominator Time Window** (*The time period in which cases are eligible for inclusion in the denominator*):

The time window starts with a hospitalization for stroke and continues for one month after discharge.

**2a.8 Denominator Details** (*All information required to collect/calculate the denominator - the target population being measured - including all codes, logic, and definitions*):

Please refer to the enclosed excel workbook entitled NQF\_Stroke\_all\_codes\_1.22.10.

The target population should have the following criteria:

1. Have an index hospitalization with a trigger code as defined in the Stroke TRIGGERS tab
2. The patient should have continuous enrollment for the entire time window with no enrollment gaps with the entity providing the data (so we can ensure that the database has captured all the claims for the patient in the time window).
3. Do not have an exclusion code. Exclusion codes are defined in the same fashion as in the Denominator Exclusion section.

**2a.9 Denominator Exclusions** (*Brief text description of exclusions from the target population*):

Denominator exclusions include exclusions of either "patients" or "claims" based on the following criteria: (1) "Patients" excluded are those with that have any form of cancer, ESRD (end-stage renal disease), transplants such as lung or heart-lung transplant or complications related to transplants, intracranial trauma, pregnancy and delivery, HIV, or suicide. (2) "Claims" are excluded from the stroke measure if they are considered not relevant to stroke care or are for major surgical services that suggests that stroke may be a comorbidity or complication associated with the procedure e.g. CABG procedure. Patients where the index hospitalization claim is excluded are automatically excluded from both the numerator and the denominator.

**2a.10 Denominator Exclusion Details** (*All information required to collect exclusions to the denominator, including all codes, logic, and definitions*):

Denominator exclusions include exclusions of "patients" as well as "claims" not relevant to stroke care. Patients where the index hospitalization claim is excluded are automatically excluded from both the numerator and the denominator.

Please refer to the enclosed excel workbook entitled NQF\_Stroke\_all\_codes\_1.22.10.

1. "Patients" are excluded from the stroke measures if they meet one of the following criteria:

- a. If age is < 18 years or >= 65 years
- b. If gender is missing
- c. If they do not have continuous enrollment for the entire time window with no enrollment gaps with the entity providing the data (so we can ensure that the database has captured all the claims for the patient in the time window).
- d. During the index hospitalization, patients have an in-hospital death or leave against medical advice.
- e. The index hospital stay cost is an outlier (less than \$50 or greater than \$ 1 million).
- f. Patients that have claims with ICD-9 diagnosis codes marked with an assignment "Termination" in column B in the EXPND Stroke TRGS tab.
- g. Patients with claims with ICD-9 diagnosis codes that map to one of the CCS diagnosis categories identified as a "1" in column C labeled "Stroke Irrelevant cases (Terminate)" in the medical tab.
- h. The total episode cost with all medical and pharmacy claims included for the episode time window is an outlier (less that \$20 or greater than \$2 million).

2. "Claims" are excluded from the stroke measure if they meet one of the following criteria:

- a. In the medical tab, claims with ICD-9 diagnosis codes that map to one of the CCS diagnosis categories identified as a "1" in column D labeled "Stroke Irrelevant claims (exclude)"
- b. In the proc tab, claims with either ICD-9 procedure codes or CPT codes that map to one of the CCS procedure categories identified as a "1" in column C labeled "Stroke Irrelevant claims (Exclude)"
- c. In the Pharm tab, pharmacy claims that map to a category identified as a delete in the "Stroke Action Descr" column

For the CCS category mapping to ICD-9 diagnosis codes see tab named CCSDX (This gives the AHRQ Clinical Classification System to categorize ICD-9 diagnosis codes into AHRQ diagnosis categories)  
 For the CCS category mapping to ICD-9 procedure codes see tab named CCSPX (This gives the AHRQ Clinical Classification System to categorize ICD-9 procedure codes into AHRQ procedure categories)  
 For the CCS category mapping to CPT codes see tab named CCSCPT ((This gives the AHRQ Clinical Classification System to categorize CPT codes into the same AHRQ procedure categories as for ICD-9 codes)

**2a.11 Stratification Details/Variables** (*All information required to stratify the measure including the stratification variables, all codes, logic, and definitions*):

None

**2a.12-13 Risk Adjustment Type:** risk-adjustment devised specifically for this measure/condition

**2a.14 Risk Adjustment Methodology/Variables** (*List risk adjustment variables and describe conceptual models, statistical models, or other aspects of model or method*):

Conceptual Model

Variations in outcomes across populations may be due to patient-related factors or due to provider-controlled factors. When we adjust for patient-related factors, the remaining variance in PACs are due to factors that could be controlled by all providers that are managing or co-managing the patient, both during and after the hospitalization.

We have developed a "severity index" based on patient-related factors such as patient demographics and comorbidities. The severity-adjusted PAC counts give a fair comparison of PACs and PAC rates from population to population and helps providers determine the degree of PACs that are not related to patient-level factors but due to factors that they could control and thus result in fewer PACs being incurred by patients and paid for by payers.

Methodology Overview

A severity index is calculated for each patient based on the risk-adjustment model for professional and other services that determines the cost drivers for typical care for a given condition. Demographic variables, comorbid conditions, various types of services as well as different patient-level pharmacy indicators are fed into the model. Conditions and services that lead to higher costs and increased resource consumption are weighted more heavily in our model. For example, DME use is associated with a higher coefficient in the model. The model determines the patient-level factors that are drivers for increased financial risk. For each patient the "predicted" log coefficients from the severity adjustment model are summed to give the patient level severity index. Summing the patient level severity index helps derive the population level severity index. Adjusting the overall PAC rates by the severity-index for the population helps adjust for variations in outcomes related to severity.

The risk-adjustment variables that were included were patient demographic factors such as age and gender, medical comorbidities, procedures performed, as well as pharmacy variables.

Variable Descriptions:

AGE CONTINUOUS VARIABLE  
 GENDERFEMALE (MALE IS REFERENCE)

The risk adjustment variables and their prevalence in our population are listed in the enclosed workbook entitled NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10 - see tabs CIP\_RiskFactors. The output of the regression model are given in the same workbook in the tab CIP\_Prof\_Risk-Adj Model.

The details of the codes that map to the risk-adjustment variables are given in the excel workbook entitled NQF\_Stroke\_all\_codes\_1.22.10.xls

**2a.15-17 Detailed risk model available Web page URL or attachment:** Attachment NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10.xls

**2a.18-19 Type of Score:** rate/proportion

**2a.20 Interpretation of Score:** better quality = lower score

**2a.21 Calculation Algorithm** (*Describe the calculation of the measure as a flowchart or series of steps*): Using administrative claims database, patients with stroke are identified as those having a hospitalization for stroke based on the trigger codes on a stay claim with no trigger exclusion codes.

Patients are retained if they are 18 - 65 years of age, do not have a missing gender, have continuous enrollment for the entire episode time window, have no outlier episode costs, and do not have a termination code. The index hospitalization, as well as professional and other claims that are incurred for one month following discharge after a stroke related hospitalization are included as part of the episode, and are considered relevant to stroke care if they have one of the filter codes present on the claim (as defined by the expanded triggers).

Relevant claims are classified as PACs based on the numerator definitions listed above. Relevant claims that do not have a single PAC code are listed as typical claims. Patients that have even a single PAC claim are counted as part of the numerator and the proportion of total stroke patients that have PACs are calculated as the measure.

A flow chart demonstrating the series of steps and the counts of patients at each step is shown in tab 1 (Decision Tree) of the enclosed workbook called NQF\_Stroke\_PACs\_Risk\_Adjustment\_2.16.10.xls

**2a.22 Describe the method for discriminating performance** (*e.g., significance testing*):

Accountability for and measurement of PACs occurs at the practice, medical group, provider system or purchaser/payer level, not for an individual physician's performance. PAC rates are calculated as absolute not relative values. For example, a health plan would report that 60% of its plan members with stroke incurred PACs in the study time window. The objective of the measure is to encourage the unit being measured to progressively reduce that amount, not to discriminate performance between two units being measured. Comparisons of PAC rates across plans or provider systems is appropriate and these organizations should be encouraged to publicly report their PAC rates. There are several tools available for provider systems and health plans to impact PAC rates. These include care coordination across care settings, post-discharge planning and patient follow-up, active care management, sharing medical record data between care settings and providers, total quality

**2a.23 Sampling (Survey) Methodology** *If measure is based on a sample (or survey), provide instructions for obtaining the sample, conducting the survey and guidance on minimum sample size (response rate):*  
 Not Applicable

**2a.24 Data Source** (*Check the source(s) for which the measure is specified and tested*)

Electronic administrative data/claims, pharmacy data

**2a.25 Data source/data collection instrument** (*Identify the specific data source/data collection*)

*instrument, e.g. name of database, clinical registry, collection instrument, etc.):*  
 CIP Database: Commercially Insured Population Database.

A two-year national commercially insured population (CIP) claims database was used as our developmental database. The database had 4.7 million covered lives and \$95 billion in “allowed amounts” for claims costs. The database was an administrative claims database with medical as well as pharmacy claims. The methodology can be used on any claims database with at least two years of data and a minimum of 150 patients with the anchor condition or hospitalization. Having pharmacy data adds to the richness of the risk-adjustment models. A standardized SAS-based program has been developed that users could download from the website to calculate PAC rates using their own data. The methodology has been tested on databases of several health plans as well as on a few employer databases.

No data collection instrument was used.

**2a.26-28** Data source/data collection instrument reference web page URL or attachment:

**2a.29-31** Data dictionary/code table web page URL or attachment: [Attachment](#)

**2a.32-35** Level of Measurement/Analysis (*Check the level(s) for which the measure is specified and tested*)  
 Clinicians: Group, Population: states, Population: counties or cities, Health Plan, Population: national, Population: regional/network, Facility/Agency

**2a.36-37** Care Settings (*Check the setting(s) for which the measure is specified and tested*)  
 Other (specify) Across entire continuum

**2a.38-41** Clinical Services (*Healthcare services being measured, check all that apply*)  
 Other Across all providers

**TESTING/ANALYSIS**

**2b. Reliability testing**

**2b.1** Data/sample (*description of data/sample and size*): We have tested the reliability of the PAC calculations by running the same analysis on two other databases. One was a small database with 87,500 members with total claims volume being 2.3 million records, and another was that of a regional health plan with over 500,000 plan members.

**2b.2** Analytic Method (*type of reliability & rationale, method for testing*):  
 No formal reliability testing done.

**2b.3** Testing Results (*reliability statistics, assessment of adequacy in the context of norms for the test conducted*):  
 In the two databases, respectively, 61% and 62% of patients with Stroke incurred PACs. These results were very consistent with the analysis in our national database.

 C   
 P   
 M   
 N

**2c. Validity testing**

**2c.1** Data/sample (*description of data/sample and size*): Not Applicable

**2c.2** Analytic Method (*type of validity & rationale, method for testing*):  
 We have presented results of the PAC analysis to physicians in three different healthcare systems involved in this pilot site implementation as well as to medical directors from the employer coalition that provided the dataset to run the analyses. This face validity testing is important in that the implementation of the measures has significant financial implications for the users. This face validity testing was positive and the physicians to whom the analyses were shown concurred with the construction of the PACs and their definitions.

<p><b>2c.3 Testing Results</b> (<i>statistical results, assessment of adequacy in the context of norms for the test conducted</i>): Not Applicable</p>	
<p><b>2d. Exclusions Justified</b></p> <p><b>2d.1 Summary of Evidence supporting exclusion(s):</b> Descriptive Explanation: Exclusions of patients were for the following reasons. Some are for comparative purposes and some for medical reasons.</p> <p>Comparative Purposes: We excluded patients that did not have complete enrollment for the entire episode time window. This was done to ensure that the database had complete information on the patients to be able to create the entire episode. Including patients with only a partial episode window could distort the measure by artificially reducing the actual count of patients with PACs. Additionally, the data modeling used a 65 age cutoff for costs analysis and development of the risk-adjustment models, but the measure applies to all age groups.</p> <p>Medical Reasons: Patients were also excluded if they had any form of cancer, ESRD (end-stage renal disease), transplants such as lung or heart-lung transplant or complications related to transplants, intracranial trauma, pregnancy and delivery, HIV, or suicide. This was done to make sure that we are capturing PACs related to Stroke in a standard setting as opposed to PACs in an extreme immune-compromised or other setting.</p> <p>The purpose of the measure is to create actionable information for most providers and payers. As such, it's important to define PACs and account for them close to a routine setting.</p> <p>Similarly, patients who had an in-hospital death, left against medical advice, or had outlier costs were considered to be different from the general pool, and excluded from both the numerator and the denominator.</p> <p><b>2d.2 Citations for Evidence:</b> 1. NCOA exclusions: HEDIS documentation <a href="http://app04.ncqa.org/faq/FAQReportList.asp?Product=100">http://app04.ncqa.org/faq/FAQReportList.asp?Product=100</a>. Last accessed Jan 28, 2010.</p> <p><b>2d.3 Data/sample</b> (<i>description of data/sample and size</i>): No formal analysis performed</p> <p><b>2d.4 Analytic Method</b> (<i>type analysis &amp; rationale</i>): No formal analysis performed</p> <p><b>2d.5 Testing Results</b> (<i>e.g., frequency, variability, sensitivity analyses</i>): No formal analysis performed</p>	<p>2d C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/> NA <input type="checkbox"/></p>
<p><b>2e. Risk Adjustment for Outcomes/ Resource Use Measures</b></p> <p><b>2e.1 Data/sample</b> (<i>description of data/sample and size</i>): A two-year nation-wide commercially insured population database was used to develop the risk-adjustment models. The database had 4.7 million covered lives and \$95 billion in "allowed amounts" for claims costs. The database was an administrative claims database with medical as well as pharmacy claims.</p> <p><b>2e.2 Analytic Method</b> (<i>type of risk adjustment, analysis, &amp; rationale</i>): Statistical Analysis Methods</p> <p>The statistical analysis methods used to create the regression model for typical care for professional (inpatient and outpatient), pharmacy and other claims are described below. We have automated our process to allow different users to use our SAS programs in their own datasets with ease. The following is an algorithm that usually results in a predictive model containing significant positive predictors and</p>	<p>2e C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/> NA <input type="checkbox"/></p>

satisfying ordinary least-square (OLS) assumptions. Some correlation between model variables or heteroscedasticity (non-constant prediction error) may still exist and can be addressed after this automated step is performed. The methodology assumes that data checks have been performed. All analyses are performed on the full dataset, after any possible trimming or data exclusions.

0. Transformation of dependent variable and Trimming: The assumptions used in OLS regression state that the model residuals (difference between actual and predicted values) must be Normal in distribution with constant variance. Cost data is usually skewed, and the model residuals usually violate this assumption. Taking the natural log of cost often solves this dilemma. It will be assumed that most of the time, this will be the case, hence the natural log of the "allowed amount" for the total episode costs [LN(ALLOW)] is the dependent variable. Even with the log transformation, unusually high or low costs can cause the model to predict poorly, so it is common practice to "trim" the data by removing a small percentage of very high and low costs. We therefore, remove patients with episode costs below the 1st percentile and above the 99th percentile.

1. Univariate screening: To determine which variables should be candidates for model development, all variables are first screened for univariate significance. The only continuous variable is AGE. A plot of AGE vs LN(ALLOW) is first examined to assess whether the relationship is linear or quadratic. If the relationship appears linear, a simple regression model is run, predicting LN(ALLOW) from AGE, and if the P-value from the regression is 0.25 or less, AGE is forced into the model. If the relationship appears to be quadratic, AGE and age-squared (AGESQ) are used to model LN(ALLOW) and if the P-values from the regression are 0.25 or less, AGE and/or AGESQ are forced into the model. To screen dichotomous variables, univariate t-tests are performed. Any variable occurring in less than 1% of the patients, more than 90% of patients, or having a p-value greater than 0.25 are eliminated.

2. Gender Variables: If age and/or age squared pass univariate screening, all age variables are forced into the model, and gender is entered into the model. If it has a p-value of .25 or less it stays.

3. Risk Factor Variables: The model resulting from the above steps is frozen, and all risk factor (name starting with "RF") variables are entered into the model using stepwise selection with SLE (significance level for model entry) = .25 and SLS (significance level for staying in model) = .25.

4. Medical Comorbidity Variables: The model resulting from the above steps is frozen, and all medical comorbidities ("M") variables are entered into the model using stepwise selection with SLE=.25 and SLS=.25.

5. Procedure Variables: The model resulting from the above steps is frozen, and all procedure ("P") variables are entered into the model using stepwise selection with SLE=.25 and SLS=.25.

6. Pharmacy Variables: The model resulting from the above steps is frozen, and all pharmacy ("PH") variables are entered into the model using stepwise selection with SLE=.25 and SLS=.25. Note- this variable group may contain any drug class, such as gastrointestinal ("GI"), oncological ("ON"), interferons ("IN"), anticonvulsants ("AC") or other types of medications. This variable group will still be referred to as "PH" variables in this document.

7. Model Cleanup: It is desirable to have model variables that are not highly correlated with each other. The Variance Inflation Factor (VIF) is used to detect correlation among model variables. The resulting model is first screened for variables having high VIF. Variables having  $VIF > 3.0$  are dropped as follows: Starting with the last variable group entered, the "PH" variables, the variable with the largest VIF over 3.0 is dropped and the model recalibrated. This continues until there are no more "PH" variables having  $VIF > 3.0$ . The same process is repeated for "P" variables, then the "M" variables, and finally for the "RF" variables. Age variables are exempt from this screening process. The resulting model should have no more  $VIF > 3.0$  occurrences for the "PH", "P", "M" or the "RF" variables. If any remaining model variables (excluding Age variables) have p-values  $> .05$  they are dropped and the model is rerun. Any variables remaining in the model with negative coefficients (except for age and gender variables, which are allowed to have negative coefficients) are dropped from the model and the model is recalibrated using the remaining coefficients. This model should have only positive coefficients (except possibly for age and gender variables), all VIF should be  $\leq 3.0$  (except possibly for age variables) and all p-values should be  $\leq .05$  or less (except possibly for age variables).

8. Initial Model: The model resulting from steps 1-8 above is considered the initial model. After review of bootstrap validation and bootstrap process validation, which are covered in steps 10 and 11, some variables may be added or dropped, and this will result in the final model.

9. Residual Analysis: A histogram is plotted of the model residuals with a standard Normal curve superimposed to assess the Normality assumption. A plot of residuals by the dependent variable is plotted to assess other problems with residuals such as heteroscedasticity. If ordinary least-squares assumptions

<p>appear to be violated, the above process may be repeated, making adjustments to the data to see if a better-fitting model will result.</p> <p>10. Bootstrap Validation: The above model is run using stepwise selection with SLE=.05 and SLS=.05 on 200 bootstrap samples, and a record is kept of how many times each variable is selected in the 200 model runs. A bootstrap sample is created by sampling with replacement from the full dataset until a sample of the same size as the full dataset is drawn. Any variables that were forced into the model above are also forced in the 200 bootstrap models. Any variable that enters into less than 160 bootstrap models (80% of the models) is dropped.</p> <p>11. Final Model: After any modifications to the initial model resulting from steps 10 and 11, the resulting model is considered the final model and is recalibrated on the full dataset.</p> <p>12. Developing the Severity-adjusted ECR typical costs: For each patient, a severity index is developed using the information on their claims data, and weighting them using the coefficients from the final predictive model generated above.</p> <p><b>2e.3 Testing Results (risk model performance metrics):</b>          The predictive capability of the model based on the adjusted R-square was 0.541. An analysis of residuals is performed as part of the model development process, and the model is retained only if the plot of residuals does not demonstrate heteroscedasticity. The Bootstrap validation helps in variable selection and variables are retained only if they enter into the model 80% of the time in the 200 bootstrap models.</p> <p><b>2e.4 If outcome or resource use measure is not risk adjusted, provide rationale:</b> Not Applicable</p>	
<p><b>2f. Identification of Meaningful Differences in Performance</b></p> <p><b>2f.1 Data/sample from Testing or Current Use (description of data/sample and size):</b> We have tested the PAC rates of hospitalized stroke patients in two other databases. One was a small database with 87,500 members with total claims volume being 2.3 million records, and another was that of a regional health plan with over 500,000 plan members.</p> <p><b>2f.2 Methods to identify statistically significant and practically/meaningfully differences in performance (type of analysis &amp; rationale):</b>          Accountability for and measurement of PACs occurs at the practice, medical group, provider system or purchaser/payer level, not for individual physician performance. PAC rates are calculated as absolutes not relative values. For example, a health plan would report that 60% of its plan members with a hospitalization for stroke incurred PACs in the study time period. The objective of the measure is to encourage the unit being measured to progressively reduce that amount, not to discriminate performance between two units of measure. However, it is appropriate to compare PAC rates between measured entities. If a health system has a 65% PAC rate for stroke while another has a 40% PAC rate, then one could reasonably assume that the patients getting care at the latter will likely incur fewer PACs than the former.</p> <p><b>2f.3 Provide Measure Scores from Testing or Current Use (description of scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance):</b>          Not Applicable</p>	<p>2f          C <input type="checkbox"/>          P <input type="checkbox"/>          M <input type="checkbox"/>          N <input type="checkbox"/></p>
<p><b>2g. Comparability of Multiple Data Sources/Methods</b></p> <p><b>2g.1 Data/sample (description of data/sample and size):</b> None</p> <p><b>2g.2 Analytic Method (type of analysis &amp; rationale):</b>          Not Applicable</p> <p><b>2g.3 Testing Results (e.g., correlation statistics, comparison of rankings):</b>          Not Applicable</p>	<p>2g          C <input type="checkbox"/>          P <input type="checkbox"/>          M <input type="checkbox"/>          N <input type="checkbox"/>          NA <input type="checkbox"/></p>
<p><b>2h. Disparities in Care</b></p>	<p>2h</p>

<p><b>2h.1</b> If measure is stratified, provide stratified results (<i>scores by stratified categories/cohorts</i>): <b>Not Applicable</b></p> <p><b>2h.2</b> If disparities have been reported/identified, but measure is not specified to detect disparities, provide follow-up plans: <b>Not Applicable</b></p>	<p>C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/> NA <input type="checkbox"/></p>
<p><b>TAP/Workgroup:</b> What are the strengths and weaknesses in relation to the sub-criteria for <i>Scientific Acceptability of Measure Properties</i>?</p>	<p>2</p>
<p><b>Steering Committee:</b> Overall, to what extent was the criterion, <i>Scientific Acceptability of Measure Properties</i>, met? <b>Rationale:</b></p>	<p>2 C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/></p>
<p><b>3. USABILITY</b></p>	
<p>Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (<a href="#">evaluation criteria</a>)</p>	<p><a href="#">Eval</a> <a href="#">Ratin</a> <a href="#">g</a></p>
<p><b>3a. Meaningful, Understandable, and Useful Information</b></p>	
<p><b>3a.1 Current Use:</b> in use</p> <p><b>3a.2 Use in a public reporting initiative (disclosure of performance results to the public at large) (If used in a public reporting initiative, provide name of initiative(s), locations, Web page URL(s). <u>If not publicly reported</u>, state the plans to achieve public reporting within 3 years):</b> PAC rates can and should be reportable publicly at the levels specified in other sections of this application, i.e. medical group, health system or health plan.</p> <p><b>3a.3 If used in other programs/initiatives (If used in quality improvement or other programs/initiatives, name of initiative(s), locations, Web page URL(s). <u>If not used for QI</u>, state the plans to achieve use for QI within 3 years):</b> Prometheus Payment Pilots: <a href="http://www.prometheuspayers.org/pilot/sites.htm">http://www.prometheuspayers.org/pilot/sites.htm</a></p> <p><b>Testing of Interpretability</b> (<i>Testing that demonstrates the results are understood by the potential users for public reporting and quality improvement</i>)</p> <p><b>3a.4 Data/sample (description of data/sample and size):</b> We have used a national database that includes over 4.5 million members and 450 million claims. 3,961 patients with stroke were included in the analysis and 58% incurred one or more PACs. A geographical variation analysis demonstrated that across the 50 states in the country, the percent of patients having at least one potentially avoidable complication in Stroke patients varied from 38% in Louisiana to 71% in Delaware.</p> <p><b>3a.5 Methods (e.g., focus group, survey, QI project):</b> We have presented results of the PAC analysis to physicians in three different healthcare systems involved in the pilot site implementation as well as to medical directors from the employer coalition that provided the dataset to run the analyses to test and validate the interpretability of the results.</p> <p><b>3a.6 Results (qualitative and/or quantitative results and conclusions):</b> The results of the PAC analyses were presented to medical directors of the plans providing the claims datasets as well as a number of physicians from pilot sites and other interested parties. These groups (which include physicians associated with the Partners Health System, the Johns Hopkins System, and the Geisinger System) have affirmed the ability to understand the definitions and results of the measure. Reviewers have concurred with the validity of the measure and the interpretability of its results. They have found the information useful to start conducting root cause analysis of the PACs as a pre-requisite to quality improvement initiatives.</p>	

<p>3b/3c. Relation to other NQF-endorsed measures</p> <p>3b.1 NQF # and Title of similar or related measures:  <a href="#">CMS-HACs (Hospital Acquired Conditions)</a></p>	
<p><b>(for NQF staff use)</b> Notes on similar/related <a href="#">endorsed</a> or submitted measures:</p>	
<p>3b. Harmonization</p> <p>If this measure is related to measure(s) already <a href="#">endorsed by NQF</a> (e.g., same topic, but different target population/setting/data source <u>or</u> different topic but same target population):</p> <p>3b.2 Are the measure specifications harmonized? If not, why?</p> <p>CMS defined hospital acquired conditions (HACs) are a subset of our PACs. We have painstakingly matched the definitions to provide as much consistency as possible. In addition, many of our risk factor and PAC groupings work out of the AHRQ CCS (Clinical Classification System). This helps leverage a reputed methodology that already exists in the public domain.</p>	<p>3b</p> <p>C <input type="checkbox"/></p> <p>P <input type="checkbox"/></p> <p>M <input type="checkbox"/></p> <p>N <input type="checkbox"/></p> <p>NA <input type="checkbox"/></p>
<p>3c. Distinctive or Additive Value</p> <p>3c.1 Describe the distinctive, improved, or additive value this measure provides to existing NQF-endorsed measures:</p> <p>To-date there are no comprehensive measures that capture the effects of care failures on patients. Potentially Avoidable Complications encompass the majority of those effects. For example, they include potentially avoidable hospitalizations as well as visits to the emergency department and other events that occur when patients do not receive the level of services recommended by expert opinion, guidelines, or safe practices.</p> <p>Reducing PACs has the potential to significantly improve the overall level of quality, and creating a single measure of accountability for physicians and hospitals tied to gaps in quality, and a measure of accountability for health plans to improve the ways in which they engage patients in more optimal care management and coordination, is likely to yield much improved outcomes for patients.</p> <p>5.1 <b>Competing Measures</b> If this measure is similar to measure(s) already endorsed by NQF (i.e., on the same topic and the same target population), describe why it is a more valid or efficient way to measure quality:</p> <p>Not Applicable</p>	<p>3c</p> <p>C <input type="checkbox"/></p> <p>P <input type="checkbox"/></p> <p>M <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p>TAP/Workgroup: What are the strengths and weaknesses in relation to the sub-criteria for <i>Usability</i>?</p>	<p>3</p>
<p>Steering Committee: Overall, to what extent was the criterion, <i>Usability</i>, met?</p> <p>Rationale:</p>	<p>3</p> <p>C <input type="checkbox"/></p> <p>P <input type="checkbox"/></p> <p>M <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p><b>4. FEASIBILITY</b></p>	
<p>Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. (<a href="#">evaluation criteria</a>)</p>	<p><a href="#">Eval</a> <a href="#">Ratin</a> <a href="#">g</a></p>
<p>4a. Data Generated as a Byproduct of Care Processes</p> <p>4a.1-2 How are the data elements that are needed to compute measure scores generated?  <a href="#">coding/abstraction performed by someone other than person obtaining original information,</a></p>	<p>4a</p> <p>C <input type="checkbox"/></p> <p>P <input type="checkbox"/></p> <p>M <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>
<p>4b. Electronic Sources</p> <p>4b.1 Are all the data elements available electronically? (<i>elements that are needed to compute measure scores are in defined, computer-readable fields, e.g., electronic health record, electronic claims</i>)</p> <p>Yes</p>	<p>4b</p> <p>C <input type="checkbox"/></p> <p>P <input type="checkbox"/></p> <p>M <input type="checkbox"/></p> <p>N <input type="checkbox"/></p>

<p><b>4b.2</b> If not, specify the near-term path to achieve electronic capture by most providers.</p>	
<p><b>4c. Exclusions</b></p> <p><b>4c.1</b> Do the specified exclusions require additional data sources beyond what is required for the numerator and denominator specifications? No</p> <p><b>4c.2</b> If yes, provide justification.</p>	<p>4c C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/> NA <input type="checkbox"/></p>
<p><b>4d. Susceptibility to Inaccuracies, Errors, or Unintended Consequences</b></p> <p><b>4d.1</b> Identify susceptibility to inaccuracies, errors, or unintended consequences of the measure and describe how these potential problems could be audited. If audited, provide results. The PAC analysis is as good as the coding in the claims databases. If the secondary diagnosis codes are not identified completely, or if the pharmacy data is missing, the risk adjustment model suffers. The PACs may also get underreported if there is incomplete coding.</p>	<p>4d C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/></p>
<p><b>4e. Data Collection Strategy/Implementation</b></p> <p><b>4e.1</b> Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data/missing data, timing/frequency of data collection, patient confidentiality, time/cost of data collection, other feasibility/ implementation issues: The results of field testing the measures by running the analysis through several different claims datasets has highlighted the importance of having a well organized claims set prior to running the measures. For example, we have learned that failure to have diagnosis codes on procedural claims can lead to significant underreporting of PACs. We have therefore clarified the data requirements necessary for appropriate calculation of the measures. When claims datasets are organized in the way we specify in the measure analysis, and contain the coding information required, the analysis of the measure and its results are highly reliable.</p> <p><b>4e.2</b> Costs to implement the measure (<i>costs of data collection, fees associated with proprietary measures</i>): The PAC measure is calculated using claims data and requires a minimal amount of analysis from the user. The only incremental cost associated to the calculation of the measure would be to ensure that all the needed data elements have been captured in the claims dataset.</p> <p><b>4e.3</b> Evidence for costs: Not Applicable</p> <p><b>4e.4</b> Business case documentation: Not Applicable</p>	<p>4e C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/></p>
<p><b>TAP/Workgroup:</b> What are the strengths and weaknesses in relation to the sub-criteria for <i>Feasibility</i>?</p>	<p>4</p>
<p><b>Steering Committee:</b> Overall, to what extent was the criterion, <i>Feasibility</i>, met? Rationale:</p>	<p>4 C <input type="checkbox"/> P <input type="checkbox"/> M <input type="checkbox"/> N <input type="checkbox"/></p>
<b>RECOMMENDATION</b>	
<p><b>(for NQF staff use)</b> Check if measure is untested and only eligible for time-limited endorsement.</p>	<p>Time-limited <input type="checkbox"/></p>
<p><b>Steering Committee:</b> Do you recommend for endorsement? Comments:</p>	<p>Y <input type="checkbox"/> N <input type="checkbox"/></p>

## ADDITIONAL INFORMATION

**Workgroup/Expert Panel involved in measure development****Ad.1 Provide a list of sponsoring organizations and workgroup/panel members' names and organizations. Describe the members' role in measure development.**

In 2006 the Prometheus Payment Design Team convened a series of meetings with physicians that had been organized in Clinical Working Groups. These Groups focused on Cancer, Cardiac, Chronic, Orthopedic and Preventive care. The results of this work were summarized in a Commonwealth Fund report published in June 2007 and served as an input to the initial modeling work performed in 2007 and early 2008. The Stroke measure was derived from this framework.

The entire history of the development of the Prometheus Payment model-defined Potentially Avoidable Complications along with the relevant references is enclosed under section Ad.3.

**AHRQ: 2010 CCS CLASSIFICATION SYSTEM FOR ICD-9 PROCEDURE CODES**

NOTE: NEW CODES ARE INTRODUCED IN OCTOBER AND OLD CODES ARE PHASED OUT IN SEPTEMBER.

ICD-9-CM CODE	CCS CATEGORY	CCS CATEGORY DESCRIPTION	ICD-9-CM CODE DESCRIPTION
'	'0'	'No PROC'	INVALID CODES IN USER DATA
'0101'	'1'	'Inc/exc CNS'	CISTERNAL PUNCTURE
'0109'	'1'	'Inc/exc CNS'	CRANIAL PUNCTURE NEC
'0121'	'1'	'Inc/exc CNS'	CRANIAL SINUS I & D
'0122'	'1'	'Inc/exc CNS'	REMOV INTRACRAN STIMULAT
'0123'	'1'	'Inc/exc CNS'	REOPEN CRANIOTOMY SITE
'0124'	'1'	'Inc/exc CNS'	OTHER CRANIOTOMY
'0125'	'1'	'Inc/exc CNS'	OTHER CRANIECTOMY
'0126'	'1'	'Incision and'	INS CATH-CRANIAL CAVITY (Begin 2005)
'0127'	'1'	'Incision and'	REM CATH-CRANIAL CAVITY (Begin 2005)
'0128'	'1'	'Inc/exc CNS'	INTRACEREB CTH-BURR HOLE (Begin 2006)
'0131'	'1'	'Inc/exc CNS'	INCISE CEREBRAL MENINGES
'0132'	'1'	'Inc/exc CNS'	LOBOTOMY & TRACTOTOMY
'0139'	'1'	'Inc/exc CNS'	OTHER BRAIN INCISION
'0141'	'1'	'Inc/exc CNS'	THALAMUS OPERATIONS
'0142'	'1'	'Inc/exc CNS'	GLOBUS PALLIDUS OPS
'0151'	'1'	'Inc/exc CNS'	EX CEREB MENINGEAL LES
'0152'	'1'	'Inc/exc CNS'	HEMISPHERECTOMY
'0153'	'1'	'Inc/exc CNS'	BRAIN LOBECTOMY
'0159'	'1'	'Inc/exc CNS'	OTHER BRAIN EXCISION
'0231'	'2'	'Extrcn shunt'	VENTRICLE SHUNT-HEAD/NECK
'0232'	'2'	'Extrcn shunt'	VENTRI SHUNT-CIRCULA SYS
'0233'	'2'	'Extrcn shunt'	VENTRICLE SHUNT-THORAX
'0234'	'2'	'Extrcn shunt'	VENTRICLE SHUNT-ABDOMEN
'0235'	'2'	'Extrcn shunt'	VENTRI SHUNT-UNINARY SYS
'0239'	'2'	'Extrcn shunt'	OTHER VENTRICULAR SHUNT
'0242'	'2'	'Extrcn shunt'	REPLACE VENTRICLE SHUNT
'0243'	'2'	'Extrcn shunt'	REMOVE VENTRICLE SHUNT
'0302'	'3'	'Laminectomy'	REOPEN LAMINECTOMY SITE
'0309'	'3'	'Laminectomy'	SPINAL CANAL EXPLOR NEC
'805'	'3'	'Laminectomy'	EXCIS DEST VERTEB DISC (Begin 1980, End 1986)
'8050'	'3'	'Laminectomy'	EXC/DEST INTVRT DISC NOS (Begin 1986)
'8051'	'3'	'Laminectomy'	EXCISION INTERVERT DISC (Begin 1986)
'8059'	'3'	'Laminectomy'	OTH EXC/DEST INTVRT DISC (Begin 1986)
'8459'	'3'	'Laminectomy'	INSERT OTHR SPIN DEVICE (Begin 2004)
'8460'	'3'	'Laminectomy'	INSERT DISC PROS NOS (Begin 2004)
'8461'	'3'	'Laminectomy'	INS PART DISC PROS CERV (Begin 2004)

'8462'	'3'	'Laminectomy'	INS TOT DISC PROST CERV (Begin 2004)
'8463'	'3'	'Laminectomy'	INS SPIN DISC PROS THOR (Begin 2004)

## The History of the development of the Prometheus Payment model-defined Potentially Avoidable Complications.

In 2006 the Prometheus Payment Design Team convened a series of meetings with practicing physicians who had been organized in Clinical Working Groups focused on Cancer, Cardiac, Chronic, Orthopedic and Preventive care. Their task was to select a starter set of clinical conditions around which episodes rates (Evidence-informed Case Rates or ECRs) could be constructed. Each condition would be fully defined by the each group, whose tasks included:

- selecting clinical practice guidelines for those conditions;
- analyzing the guidelines to determine the natural boundaries of the ECR (trigger and end);
- providing a rigorous estimate of the scope of services of the ECR, including the total units of service and the types of providers responsible for delivering those services as outlined in the guidelines;
- establishing a reasonable set of performance measures that should be used to evaluate the clinical performance of providers delivering the services included in the ECR;
- identifying routine complications that are prevalent for patients that don't receive optimal care;
- participating in and supervising the data modeling of the ECR to determine the extent to which the results were valid; and
- creating estimates for the warranted variation of services that should be added to the base.

The results of this work were summarized in a Commonwealth Fund report published in June 2007<sup>1</sup>, and served as an input to the initial modeling work performed in 2007 and early 2008. Starting with AMI, Hip replacement, Knee replacement, and Diabetes, the objective was to analyze a large claims database in order to determine the amount of unexplainable variation in total costs of care that could be reasonably attributed to complications under the control of providers.

The Clinical Working Groups had acknowledged that there are increases in severity of patients over time that are not caused by provider action or omission, but rather by a natural deterioration of the organs. As Patrick O'Connor from HealthPartners put it: "Every patient with diabetes eventually dies".

In its work on determining a framework for efficiency, the National Quality Forum<sup>2</sup> also concluded that there are metabolic pathways for certain patients that will simply lead to increased severity of the condition caused by the progression of the disease while others will be stabilized. All these frameworks essentially acknowledge the same construct – there are typical sets of services that one expects to observe in the care of a patient at any given time, and these services will vary over time as the patient's condition changes; however there are also non-typical services that occur as a result of quality "defects". We initially termed the first type of variation warranted and the second unwarranted. Subsequently, and in deference to the model developed by Geisinger, we switched the terminology to typical services and services associated with potentially avoidable complications (PACs).

As the data modeling started to yield outputs, it became clear that the current coding practices in hospitals and physician offices allowed us to identify claims and events within a claim that were associated to PACs.

Our starting definition of a PAC was guided by the product of the Clinical Working Groups, and we subsequently used a rather large circle of collaborating organizations throughout the country with whom we interfaced continuously during the development of the methodology (see Appendix A).

At its core, the definition of a PAC is any event that negatively impacts the patient and is potentially controllable by all the physicians and hospitals that manage and co-manage the patient. In its seminal report, To Err is Human, the Institute of Medicine highlighted a significant number of these negative events, including a host of hospital-acquired conditions that have since become defined by the CMS<sup>3</sup>. In addition, the AHRQ has used

<sup>3</sup> See [http://www.cms.hhs.gov/HospitalAcqCond/06\\_Hospital-Acquired\\_Conditions.asp#TopOfPage](http://www.cms.hhs.gov/HospitalAcqCond/06_Hospital-Acquired_Conditions.asp#TopOfPage)

the same research to base its Patient Safety Indicators<sup>4</sup> – any hit in the numerator of those measures is a negative event impacting a patient.

To Err is Human also pointed out that the lack of care coordination for patients with chronic conditions led to a significant number of unnecessary hospitalizations. Work by Wagner and colleagues showed how extensively these hospitalizations could be reduced when care for these patients was optimized. More recently, Jencks<sup>5</sup> and colleagues highlighted the significant number of readmissions that occur post discharge that could be reduced with better transitions in the care of patients.

All these negative events are included in our definitions of Potentially Avoidable Complications. In fact, we have used the specific AHRQ and CMS definitions. Readmissions are easy to account for in an episode when the window of that episode is appropriately set, and we count readmissions as PACs. We summarized our initial modeling work in a Commonwealth Fund report published in June 2008<sup>6</sup>. Subsequently, under a Robert Wood Johnson Foundation grant, we continued to model an increasing number of ECRs through 2008 and 2009, stabilizing the rules and models. At each step we used the circle of clinical advisers to inform the models and validate the findings. Further, our field work in four pilot sites provided us an opportunity to work directly with physicians and hospitals to get input in and feedback on our definitions of PACs.

There are essentially two important concepts associated with PACs that providers have wrestled with initially. The first is the tendency for providers to think in absolutes and reject the very notion of personal failure. In other words, clinicians fear that the model expects no complications to occur. However, the IOM report cited above taught all of us that to err is indeed human, and that even great people surrounded by great systems will occasionally fail. As such, the purpose of measuring PACs and holding providers accountable for reducing them is not an exercise in reaching zero defects, rather the goal is to significantly reduce them. The chart below illustrates the extent of the variation that exists in PAC rates across the country (the blue bars represent typical costs and the red

bars PAC costs), but it also illustrates that some are doing a far better job at managing PACs than others.

And our analysis also suggests that the majority of the variation in total costs can be explained by the variation in PACs. The balance is explainable by the difference in the relative severity of the patients. These two findings are highly consistent with the NQF Framework on Efficiency aforementioned, but also with the findings in the IOM’s follow-up report, Crossing The Quality Chasm – defects occur often and they are caused by gaps in the system of care as well as gaps in provider competence.

The second point that individual physicians or hospitals bristle at is the notion that they might be held accountable for failures by providers other than themselves, and yet, fixing that issue was the central theme of Crossing The Quality Chasm; and the purpose of our measurement of PACs that affect the patient across the care continuum is simply an expression of that report's recommendations on payment policies which stipulated:

*Aligning payment policies with quality improvement.* Although payment is not the only factor that influences provider and patient behavior, it is an important one. The committee calls for all purchasers, both public and private, to carefully reexamine their payment policies to remove barriers that impede quality improvement and build in stronger incentives for quality enhancement. Clinicians should be adequately compensated for taking good care of all types of patients, neither gaining nor losing financially for caring for sicker patients or those with more complicated conditions. Payment methods also should provide an opportunity for providers to share in the benefits of quality improvement, provide an opportunity for consumers and purchasers to recognize quality differences in health care and direct their decisions accordingly, align financial incentives with the implementation of care processes based on best practices and the achievement of better patient outcomes, and enable providers to coordinate care for patients across settings and over time.<sup>7</sup>

In and of themselves, PACs don't accomplish all the goals in the policy stated above, however, the Prometheus Payment model does by creating an allowance for PACs and adding it to a severity-adjusted typical budget for a patient's clinical episode of care. In June 2009<sup>8</sup> we published a paper that showed how severity-adjusting ECRs and adding a PAC allowance (which is also severity-adjusted) creates an incentive to care for sicker patients and enables clinicians who reduce PACs (improve quality) to financially benefit from that improvement.

As we continued to review the outputs from modeling ECRs, and refining the models themselves, we created a categorization of PACs by type of ECR. Importantly, the core

concept of measuring PACs is to have a patient-centric measurement, not a provider-specific measurement. As such, and for example, we measure potentially avoidable complications for a patient who has an MI (or a joint replacement, or some other procedure), not for physicians and hospitals that treat MIs. The difference is that the patient who is admitted for an acute MI likely has one or more chronic illness, and might have other diseases or conditions. The patient's expectation is that the health care delivery "system" will take care of all needs, not just the MI. For that is what a patient-centric health care system should do, and if we want to encourage patient-centricity, we need to move from provider-centric measures to patient-centric ones.

We have therefore defined three categories of PACs:

- Related to the index condition or stay – for example, an ED visit for keto-acidosis by a diabetic patient, or a repeat MI within 30 days of discharge for a patient hospitalized with an AMI.
- Related to the patient's co-morbidities – for example, an ED visit for pneumonia in a diabetic patient, or diabetic coma of a patient hospitalized for a joint replacement.
- Related to patient safety failures – for example, an adverse drug event for a patient with COPD, or a post-operative wound infection.

This segmentation is core to understanding both the intent and function of PACs. In our view (and that of the IOM's and many health care services researchers), a patient with diabetes who is admitted to the hospital for an AMI, stroke or pneumonia should get treatment and follow-up care not simply for the reason they were admitted, but for anything else that ails them. Today's health care non-system is simply not accountable for defects that go slightly beyond the scope of the specific and narrowly-defined intervention. There is no financial downside for the providers when the defects occur, and there are to-date no quality measures that create accountability. Therefore, if a patient with diabetes who had an AMI is readmitted within 30 days for hypo or hyper-glycemia, we consider that a potentially avoidable complication. While the hospital and cardiologists might disagree, any actual system of care—whether virtually or organizationally integrated--would have to agree since an "accountable care organizations" (ACOs) is expected to be accountable not just for what they do in a tight scope, but also regarding what happens to the patient overall. Our definitions of PACs create the right level of accountability for organizations that would purport to be ACOs.

These categories of PACs are found in the different types of ECRs, with a further delineation based on the primary site of the PACs:

- Acute Medical Events –
  - inpatient-based PACs (which include HACs and PSIs), and
  - readmissions within 30 days of discharge for the same and related reasons as the initial admission.
  
- Inpatient and Outpatient Procedures – similar to acute medical events, procedures can lead to two types of potentially avoidable complications; in August 2009 we published a paper that summarizes the definitions of PACs for hip and knee replacements<sup>9</sup>.
  - those that occur during the procedure (or during the stay for inpatient procedures) and
  - those that occur post-discharge.
  
- Chronic Conditions – generally, any hospitalization related to the patient’s core chronic condition or any co-morbidity is considered a potentially avoidable complication, unless that hospitalization is considered to be a typical service for a patient with that condition.

To-date, we have used our ECR analytics in over a dozen different databases of national and regional health plans and employers. We have discovered a great consistency in the nature, frequency and costs associated with PACs. More importantly, we have found that when physicians and hospitals understand that (a) the goal is not zero defects but an improvement from current performance levels, and (b) the payment model will reward reduction in PACs, the objections to the definitions of PACs disappear.

We make no excuses for having a broad view of accountability around events that harm patients. Quite the contrary. It is only by looking at system failures and care defects from the patient’s eyes that we can create a patient-centered health care system; and counting PACs will help us understand the magnitude of the problems that the Institute of Medicine highlighted a decade ago, and that still plague the health care system today.

## **Appendix A – Collaboration in ECR Development:**

Code sets and boundaries for ECRs were created with the help of several groups:

- Chronic Medical ECRs:
  - AHRQ (Dr. Steve Bandean) – provided definitions for triggers & complications: DM, COPD, Asthma, CAD, HTN
- GI related ECRs:
  - GERD, Colonoscopy, and Cholecystectomy: Drs. Joel Brill, John Allen & Mary Igo from Minnesota Gastroenterology from Twin Cities & AGA
- Hip / Knee ECRs:
  - Dr. Bob Haralson with the American Academy of Orthopedic Surgeons (AAOS)
  - Premier Trigger Definitions
  - CMS: Definitions of HACs / Federal Register discussion
- Bariatric Surgery:
  - Dr. Jonathan Weiner from the Johns Hopkins University with the Patterns of Obesity Care Research team sent trigger codes, complications, results of their analysis, papers
  - Health Partners sent Bariatric Surgery Clinical Guidelines
- Pregnancy & Delivery:
  - Dr. Elliott Main & Dr. Debra Bingham from the California Maternal Quality Care Collaborative (CMQCC) at Stanford helped define the entire ECR

## Reliability of Prometheus PAC (Potentially Avoidable Complications) Measures

Potentially avoidable complications (PACs) for patients with one or more chronic illness include events such as emergency department visits and hospitalizations. For patients hospitalized with an acute medical illness such as AMI, pneumonia or stroke, these events may occur during the index stay or during the 30-day post-discharge period. PACs include measures that have already been tested and are widely used such as ambulatory-care sensitive admissions, hospital-acquired conditions and inpatient-based patient safety failures.

The development, modeling and testing of the PAC measures in several commercial claims databases have resulted in the publication of several papers in peer-reviewed journals<sup>1-4</sup>, including a current paper published in August 2010 in Health Services Research which analyzes the regional variability of PAC rates.

To test the PAC measures and definitions as part of a broader effort to implement the Prometheus Payment model, we developed an analytical software application built on SAS, which includes all the definitions and codes to calculate PACs that occur in a study population, create the severity-adjustments, and determine PAC rates amongst other analyses. Prior to releasing this application, we thoroughly tested and validated its results to determine the reliability with which it could produce a consistent result. Each run returned the same PAC rate for any given ECR in our developmental database.

To date, this analytical package has been used on over 20 claims database, including the Blue Cross and Blue Shield Association's master database called Blue Health Intelligence, which contains close to 30 million members. The analytical package has been used, tested and validated by several organizations including RAND, Partners HealthCare, HealthPartners, Horizon Blue Cross Blue Shield, WellPoint and Aetna (Table 1). The charts below illustrates the bands of observed PAC rates across the different databases analyzed for chronic conditions

\*CIP: Commercially Insured Population – this was our national developmental database with 4.7 million covered lives and \$95 billion in claim costs that formed the basis of ECR construction as well as the regional analysis. MassPRO was our data partner where the SAS programs were developed, tested and validated.
