Measure Submission and Evaluation Worksheet 5.0

This form contains the information submitted by measure developers/stewards, organized according to NQF's measure evaluation criteria and process. The evaluation criteria, evaluation guidance documents, and a blank online submission form are available on the [submitting standards web page](#).

NQF #: 1789	NQF Project: Readmissions Project
(for Endorsement Maintenance Review)	
Original Endorsement Date: Most Recent Endorsement Date:	
BRIEF MEASURE INFORMATION	
De.1 Measure Title: Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	
Co.1.1 Measure Steward: Centers for Medicare & Medicaid Services (CMS)	
De.2 Brief Description of Measure: This measure estimates the hospital-level, risk-standardized rate of unplanned, all-cause readmission after admission for any eligible condition within 30 days of hospital discharge (RSRR) for patients aged 18 and older. The measure reports a single summary RSRR, derived from the volume-weighted results of five different models, one for each of the following specialty cohorts (groups of discharge condition categories or procedure categories): surgery/gynecology, general medicine, cardiorespiratory, cardiovascular, and neurology, each of which will be described in greater detail below. The measure also indicates the hospital standardized risk ratios (SRR) for each of these five specialty cohorts. We developed the measure for patients 65 years and older using Medicare fee-for-service (FFS) claims and subsequently tested and specified the measure for patients aged 18 years and older using all-payer data. We used the California Patient Discharge Data (CPDD), a large database of patient hospital admissions, for our all-payer data.	
2a1.1 Numerator Statement: (Note: This outcome measure does not have a traditional numerator and denominator like a core process measure (e.g., percentage of adult patients with diabetes aged 18-75 years receiving one or more hemoglobin A1c tests per year); thus, we use this field to define the measure outcome.)	
The outcome for this measure is unplanned all-cause 30-day readmission. We defined a readmission as an inpatient admission to any acute care facility which occurs within 30 days of the discharge date of an eligible index admission. All readmissions are counted as outcomes except those that are considered planned.	
2a1.4 Denominator Statement: This claims-based measure can be used in either of two patient cohorts: (1) admissions to acute care facilities for patients aged 65 years or older or (2) admissions to acute care facilities for patients aged 18 years or older. We have tested the measure in both age groups.	
2a1.8 Denominator Exclusions: We exclude from the measure all admissions for which full data are not available or for which 30-day readmission by itself cannot reasonably be considered a signal of quality of care.	
Exclusions:	
1. Admissions for patients without 30 days of post-discharge data Rationale: This is necessary in order to identify the outcome (readmission) in the dataset.	
2. Admissions for patients lacking a complete enrollment history for the 12 months prior to admission Rationale: This is necessary to capture historical data for risk adjustment.	
3. Admissions for patients discharged against medical advice (AMA) Rationale: Hospital had limited opportunity to implement high quality care.	
4. Admissions for patients to a PPS-exempt cancer hospital Rationale: These hospitals care for a unique population of patients that is challenging to compare to other hospitals.	

NQF #1789 Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)

5. Admissions for patients with medical treatment of cancer (See Table 3 in Section 2a1.9)
 Rationale: These admissions have a very different mortality and readmission profile than the rest of the Medicare population, and outcomes for these admissions do not correlate well with outcomes for other admissions.
 (Patients with cancer who are admitted for other diagnoses or for surgical treatment of their cancer remain in the measure).

6. Admissions for primary psychiatric disease (see Table 4 in Section 2a1.9)
 Rationale: Patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals.

7. Admissions for "rehabilitation care; fitting of prostheses and adjustment devices"
 Rationale: These admissions are not for acute care or to acute care hospitals.

Additionally, in the all-payer testing, we excluded obstetric admissions because the measure was developed among patients aged 65 years or older (approximately 500,000).

1.1 Measure Type: Outcome
 2a1. 25-26 Data Source: Administrative claims
 2a1.33 Level of Analysis: Facility

1.2-1.4 Is this measure paired with another measure? No

De.3 If included in a composite, please identify the composite measure (title and NQF number if endorsed):
 N/A

STAFF NOTES (issues or questions regarding any criteria)

Comments on Conditions for Consideration:

Is the measure untested? Yes No If untested, explain how it meets criteria for consideration for time-limited endorsement:

1a. Specific national health goal/priority identified by DHHS or NPP addressed by the measure (check De.5):
 5. Similar/related endorsed or submitted measures (check 5.1):
 Other Criteria:

Staff Reviewer Name(s):

1. IMPACT, OPPORTUNITY, EVIDENCE - IMPORTANCE TO MEASURE AND REPORT

Importance to Measure and Report is a threshold criterion that must be met in order to recommend a measure for endorsement. All three subcriteria must be met to pass this criterion. See [guidance on evidence](#).
Measures must be judged to be important to measure and report in order to be evaluated against the remaining criteria.
[\(evaluation criteria\)](#)

1a. High Impact: H M L I
 (The measure directly addresses a specific national health goal/priority identified by DHHS or NPP, or some other high impact aspect of healthcare.)

De.4 Subject/Topic Areas (Check all the areas that apply): Cardiovascular, Cardiovascular : Acute Myocardial Infarction, Cardiovascular : Atrial Fibrillation, Cardiovascular : Congestive Heart Failure, Cardiovascular : Hyperlipidemia, Cardiovascular : Hypertension, Cardiovascular : Ischemic Heart Disease, Coronary Artery Disease, Cardiovascular : Percutaneous Coronary Intervention (PCI), Endocrine, Endocrine : Diabetes, GI, GI : Appendicitis, GI : Bleeding, GI : Cirrhosis, GI : Gall Bladder Disease, GI : Gastroenteritis, GI : Gastro-Esophageal Reflux Disease (GERD)/Peptic Ulcer, GI : Polyps, GU/GYN, GU/GYN : Gynecology, GU/GYN : Incontinence, GU/GYN : Male Genito-Urinary, HEENT, Infectious Diseases, Infectious Diseases : Hepatitis, Infectious Diseases : Respiratory, Infectious Diseases : Sexually Transmitted, Infectious Diseases : Tuberculosis, Musculoskeletal, Musculoskeletal : Arthritis-Osteo, Musculoskeletal : Arthritis-Rheumatoid, Musculoskeletal : Functional Status, Musculoskeletal : Hip/Pelvic Fracture, Musculoskeletal : Joint Surgery, Musculoskeletal : Low Back Pain, Musculoskeletal : Osteoporosis, Neurology,

Neurology : Dementia/Delirium, Neurology : Stroke/Transient Ischemic Attack (TIA), Pulmonary/Critical Care, Pulmonary/Critical Care : Asthma, Pulmonary/Critical Care : Chronic Obstructive Pulmonary Disease (COPD), Pulmonary/Critical Care : Critical Care, Pulmonary/Critical Care : Dyspnea, Pulmonary/Critical Care : Pneumonia, Pulmonary/Critical Care : Sleep/Sleep Apnea, Renal, Renal : Chronic Kidney Disease (CKD), Renal : End Stage Renal Disease (ESRD), Surgery, Surgery : Cardiac, Surgery : General Surgery, Surgery : Perioperative, Surgery : Thoracic, Surgery : Vascular
 De.5 Cross Cutting Areas (Check all the areas that apply): Care Coordination

1a.1 Demonstrated High Impact Aspect of Healthcare: Affects large numbers, A leading cause of morbidity/mortality, Frequently performed procedure, High resource use, Patient/societal consequences of poor quality, Severity of illness

1a.2 If "Other," please describe:

1a.3 Summary of Evidence of High Impact (Provide epidemiologic or resource use data):

During 2003 and 2004, almost one fifth of Medicare beneficiaries – over 2.3 million patients – were rehospitalized within 30 days of discharge from an acute care hospital [1]. Jencks et. al. estimated that readmissions within 30 days of discharge cost Medicare more than \$17 billion annually [1]. A 2006 Commonwealth Fund report further estimated that if national readmission rates were lowered to the levels achieved by the top performing regions, Medicare would save \$1.9 billion annually [2]. In a 2007 report to the Congress, the Medicare Payment Advisory Commission (MedPAC) estimated that in 2005, 17.6% of hospital patients were readmitted within 30 days of discharge and that 76% of these readmissions were potentially preventable; the average payment for a "potentially preventable" readmission was estimated at approximately \$7,200 [3].

1b. Opportunity for Improvement: H M L I

(There is a demonstrated performance gap - variability or overall less than optimal performance)

1b.1 Briefly explain the benefits (improvements in quality) envisioned by use of this measure:

The Hospital-wide All-Cause Unplanned Readmission Measure reports the hospital-level, risk-standardized rate of unplanned all-cause readmission within 30 days of hospital discharge. A hospital's readmission rate is related to complex and critical aspects of care such as communication between providers; prevention of, and response to, complications; patient safety; and coordinated transitions to the outpatient environment. These are of importance to patients, physicians, hospitals and policymakers. While disease-specific measures of readmission are helpful to identify deficiencies in care for specific groups of patients, they account for only a small minority of total readmissions [1]. By contrast, a hospital-wide, all-condition readmission measure could provide a broad sense of the quality of care at hospitals. In this way, the measure can promote hospital quality improvement and better inform consumers about care quality.

Studies have estimated the rate of preventable readmissions to be as low as 12% and as high as 76% [2,3]. Some readmissions are unavoidable and result from inevitable progression of disease or worsening of chronic conditions. However, readmissions may also result from poor quality of care or inadequate transitional care. Randomized controlled trials have shown that improvement in the following areas can directly reduce readmission rates: quality of care during the initial admission; improvement in communication with patients, their caregivers and their clinicians; patient education; pre-discharge assessment; and coordination of care after discharge. Evidence that hospitals have been able to reduce readmission rates through these quality-of-care initiatives illustrates the degree to which hospital practices can affect readmission rates. Successful randomized trials have reduced 30-day readmission rates by 20-40% [4-14].

Since 2008, 14 Medicare Quality Improvement Organizations have been funded to focus on care transitions, applying lessons learned from clinical trials. Several have been notably successful in reducing readmissions. The strongest evidence supporting the efficacy of improved discharge processes and enhanced care at transitions is a randomized controlled trial by Project RED (Re-Engineered Discharge), which demonstrated a 30% reduction in 30-day readmissions. In this intervention, a nurse was assigned to each patient as a discharge advocate, responsible for patient education, follow-up, medication reconciliation, and preparing

individualized discharge instructions sent to the patient's primary care provider. A follow-up phone call from a pharmacist within 4 days of discharge was also part of the intervention [4].

Given that studies have shown readmissions to be related to quality of care, and that interventions have been able to reduce 30-day readmission rates, it is reasonable to consider an all-condition readmission rate as a quality measure.

1b.2 Summary of Data Demonstrating Performance Gap (*Variation or overall less than optimal performance across providers*):

[**For Maintenance** – Descriptive statistics for performance results for this measure - distribution of scores for measured entities by quartile/decile, mean, median, SD, min, max, etc.]

In a 2007 report to the Congress, the Medicare Payment Advisory Commission (MedPAC) estimated that in 2005, 17.6% of hospital patients were readmitted within 30 days of discharge and that 76% of these readmissions were potentially preventable [1].

There was marked variation in 30-day risk-standardized readmission rates (RSRRs) across hospitals for acute myocardial infarction (AMI), heart failure, and pneumonia (2006-2008 data) [1,2]. The median 30-day risk-standardized readmission rate was 19.9% for AMI (range from 15.3% to 25.2%), 24.5% for heart failure (range from 17.0% to 33.2%), and 18.1% for pneumonia (range from 12.7% to 27.4%). There are also significant regional variations in hospital readmission rates: Hospital referral regions (HRRs) with low AMI readmission rates are found in the Northwest, comprising the bottom quintile with 16.7% to 19.3% readmission. Hospitals with the highest quintile are found predominately in the Northeast, with readmission rates between 25.2% and 29.0%. Similarly, heart failure readmission rates between 20.8% and 23.2%, making up the bottom quintile, are largely found in the Northwest. Hospitals in the top quintile populate the East with readmission rates between 20.3% and 22.1%. In all types of settings there are high and low performers [3].

Therefore, while readmission rates would never be expected to be zero, both a high baseline rate of readmission in the United States and the variation in readmission rates across institutions suggest that readmissions are related to quality of care.

The results for this measure using the 2007-2008 development sample reveal an overall raw readmission rate ranging from 0% to 36.6% with a median of 16.4%; and a RSRR ranging from 12.6% to 22.8% with a mean of 16.7%.

1b.3 Citations for Data on Performance Gap: [*For Maintenance* – Description of the data or sample for measure results reported in 1b.2 including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included]

1b.4 Summary of Data on Disparities by Population Group: [*For Maintenance* –Descriptive statistics for performance results for this measure by population group]

An analysis of 30-day readmission rates for AMI, congestive heart failure, and pneumonia using Medicare data determined odds ratios for black vs. white patients, at minority-serving vs. non-minority-serving hospitals. Black patients had higher readmission rates than white patients across the three conditions, and patients from minority-serving hospitals had higher readmission rates than non-minority-serving hospitals [1]. A comparison of black and white Medicare patient 30-day and 90-day rehospitalization rates at skilled nursing homes found disparities persisted after multivariable adjustments [2].

Analyses of RSRRs for AMI, heart failure, and pneumonia focused on proportion of African-American patients treated at hospitals found disparities across population groups. Hospitals treating a high proportion of African-American patients, particularly those hospitals where African-Americans constitute greater than 19% of admissions, have higher RSRRs for AMI, heart failure, and pneumonia among all patients. However, regardless of hospital proportion of African-American patients, RSRR distributions are wide and similar across hospitals [3].

1c. Evidence (Measure focus is a health outcome OR meets the criteria for quantity, quality, consistency of the body of evidence.)
Is the measure focus a health outcome? Yes No If not a health outcome, rate the body of evidence.

Quantity: H M L I Quality: H M L I Consistency: H M L I

Quantity	Quality	Consistency	Does the measure pass subcriterion1c?
M-H	M-H	M-H	Yes <input type="checkbox"/>
L	M-H	M	Yes <input type="checkbox"/> IF additional research unlikely to change conclusion that benefits to patients outweigh harms: otherwise No <input type="checkbox"/>
M-H	L	M-H	Yes <input type="checkbox"/> IF potential benefits to patients clearly outweigh potential harms: otherwise No <input type="checkbox"/>
L-M-H	L-M-H	L	No <input type="checkbox"/>
Health outcome – rationale supports relationship to at least one healthcare structure, process, intervention, or service			Does the measure pass subcriterion1c? Yes <input type="checkbox"/> IF rationale supports relationship

1c.1 Structure-Process-Outcome Relationship (Briefly state the measure focus, e.g., health outcome, intermediate clinical outcome, process, structure; then identify the appropriate links, e.g., structure-process-health outcome; process- health outcome; intermediate clinical outcome-health outcome):

This is an outcome measure.

1c.2-3 Type of Evidence (Check all that apply):

Other

N/A This is an outcome measure, not a process measure.

1c.4 Directness of Evidence to the Specified Measure (State the central topic, population, and outcomes addressed in the body of evidence and identify any differences from the measure focus and measure target population):

N/A This is an outcome measure, not a process measure.

1c.5 Quantity of Studies in the Body of Evidence (Total number of studies, not articles): N/A This is an outcome measure, not a process measure.

1c.6 Quality of Body of Evidence (Summarize the certainty or confidence in the estimates of benefits and harms to patients across studies in the body of evidence resulting from study factors. Please address: a) study design/flaws; b) directness/indirectness of the evidence to this measure (e.g., interventions, comparisons, outcomes assessed, population included in the evidence); and c) imprecision/wide confidence intervals due to few patients or events): N/A This is an outcome measure, not a process measure.

1c.7 Consistency of Results across Studies (Summarize the consistency of the magnitude and direction of the effect): N/A This is an outcome measure, not a process measure.

1c.8 Net Benefit (Provide estimates of effect for benefit/outcome; identify harms addressed and estimates of effect; and net benefit - benefit over harms):

N/A This is an outcome measure, not a process measure.

1c.9 Grading of Strength/Quality of the Body of Evidence. Has the body of evidence been graded? No

1c.10 If body of evidence graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias: N/A This is an outcome measure, not a process measure.

1c.11 System Used for Grading the Body of Evidence: Other

1c.12 If other, identify and describe the grading scale with definitions: N/A This is an outcome measure, not a process measure.

1c.13 Grade Assigned to the Body of Evidence: N/A This is an outcome measure, not a process measure.

1c.14 Summary of Controversy/Contradictory Evidence: N/A This is an outcome measure, not a process measure.

1c.15 Citations for Evidence other than Guidelines(Guidelines addressed below):

N/A This is an outcome measure, not a process measure.

1c.16 Quote verbatim, the specific guideline recommendation (Including guideline # and/or page #):

N/A This is an outcome measure, not a process measure.

1c.17 Clinical Practice Guideline Citation: N/A This is an outcome measure, not a process measure.

1c.18 National Guideline Clearinghouse or other URL: N/A This is an outcome measure, not a process measure.

1c.19 Grading of Strength of Guideline Recommendation. Has the recommendation been graded? No

1c.20 If guideline recommendation graded, identify the entity that graded the evidence including balance of representation and any disclosures regarding bias:

1c.21 System Used for Grading the Strength of Guideline Recommendation: [Other](#)

1c.22 If other, identify and describe the grading scale with definitions: [N/A This is an outcome measure, not a process measure.](#)

1c.23 Grade Assigned to the Recommendation:

1c.24 Rationale for Using this Guideline Over Others: [N/A This is an outcome measure, not a process measure.](#)

Based on the NQF descriptions for rating the evidence, what was the developer's assessment of the quantity, quality, and consistency of the body of evidence?

1c.25 Quantity: [High](#) 1c.26 Quality: [High](#) 1c.27 Consistency: [High](#)

Was the threshold criterion, *Importance to Measure and Report*, met?
(1a & 1b must be rated moderate or high and 1c yes) Yes No

Provide rationale based on specific subcriteria:

For a new measure if the Committee votes NO, then STOP.

For a measure undergoing endorsement maintenance, if the Committee votes NO because of 1b. (no opportunity for improvement), it may be considered for continued endorsement and all criteria need to be evaluated.

2. RELIABILITY & VALIDITY - SCIENTIFIC ACCEPTABILITY OF MEASURE PROPERTIES

Extent to which the measure, as specified, produces consistent (reliable) and credible (valid) results about the quality of care when implemented. ([evaluation criteria](#))

Measure testing must demonstrate adequate reliability and validity in order to be recommended for endorsement. Testing may be conducted for data elements and/or the computed measure score. Testing information and results should be entered in the appropriate field. Supplemental materials may be referenced or attached in item 2.1. See [guidance on measure testing](#).

S.1 **Measure Web Page** (*In the future, NQF will require measure stewards to provide a URL link to a web page where current detailed specifications can be obtained*). Do you have a web page where current detailed specifications for this measure can be obtained? [No](#)

S.2 If yes, provide web page URL:

2a. RELIABILITY. Precise Specifications and Reliability Testing: H M L I

2a1. Precise Measure Specifications. (*The measure specifications precise and unambiguous.*)

2a1.1 **Numerator Statement** (*Brief, narrative description of the measure focus or what is being measured about the target population, e.g., cases from the target population with the target process, condition, event, or outcome*):

([Note: This outcome measure does not have a traditional numerator and denominator like a core process measure \(e.g., percentage of adult patients with diabetes aged 18-75 years receiving one or more hemoglobin A1c tests per year\); thus, we use this field to define the measure outcome.](#))

[The outcome for this measure is unplanned all-cause 30-day readmission. We defined a readmission as an inpatient admission to any acute care facility which occurs within 30 days of the discharge date of an eligible index admission. All readmissions are counted as outcomes except those that are considered planned.](#)

2a1.2 **Numerator Time Window** (*The time period in which the target process, condition, event, or outcome is eligible for inclusion*):
[The time window for readmission is within 30 days from the date of discharge of the index admission.](#)

2a1.3 **Numerator Details** (*All information required to identify and calculate the cases from the target population with the target*

process, condition, event, or outcome such as definitions, codes with descriptors, and/or specific data collection items/responses:
 The outcome for this measure is unplanned all-cause readmission within 30 days of discharge date of an eligible index admission. Because planned readmissions are not a signal of quality of care, the measure does not count planned readmissions in the outcome. The measure uses an algorithm to identify “planned readmissions” in claims data that will not count as readmissions in the measure. The algorithm is based on two main principles:

- 1- “Planned” readmissions are those in which one of a pre-specified list of procedures took place (which will be described in detail below), or those for maintenance chemotherapy, organ transplant, or rehabilitation.
- 2- Admissions for acute illness or for complications of care are not “planned.” Even a typically planned procedure performed during an admission for an acute illness would not likely have been planned. We can identify readmissions as acute or non-acute by considering the principal discharge condition.

The algorithm developed to identify planned readmissions uses procedure codes and discharge diagnosis categories for each readmission. The HWR measure defines planned readmissions as any readmission that was either:

A non-acute readmission in which one of 35 typically planned procedures occurs;

or

A readmission for maintenance chemotherapy, organ transplant, or rehabilitation

All other readmissions are considered unplanned and are counted as readmissions in the measure. The following examples illustrate this approach:

Example 1:

A readmission with a discharge condition category of biliary tract disease that included a cholecystectomy would be considered planned.

A readmission with a discharge condition category of septicemia that included a cholecystectomy would be considered unplanned.

A readmission with a discharge condition category of “complications of surgical procedures or medical care” would be considered unplanned.

List of planned procedures (Table 1)

Planned procedures are identified using AHRQ Clinical Classification System (CCS) procedure category list (Table 1).

Readmissions in which any of these procedures are performed are considered planned if the discharge condition category is not acute or a complication of care (i.e., not listed in Table 2).

Table 1: Procedure categories considered planned

AHRQ Procedure CCS//Description//Readmissions with no excluding diagnosis (“planned” readmissions): Number, Percent of total planned readmissions in the 2008 Medicare Provider Analysis and Review (MedPAR) dataset used for measure development

45//Percutaneous transluminal coronary angioplasty (PTCA)	//12,038, 13.83%
//Rehabilitation (Condition CCS 254)	//9,973, 11.46%
84//Cholecystectomy and common duct exploration	//7,191, 8.26%
157//Amputation of lower extremity	//6,649, 7.64%
44//Coronary artery bypass graft (CABG)	//6,290, 7.23%
78//Colorectal resection	//4,719, 5.42%
51//Endarterectomy; vessel of head and neck	//4,558, 5.24%
113//Transurethral resection of prostate (TURP)	//3,752, 4.31%
99//Other OR gastrointestinal therapeutic procedures	//3,475, 3.99%

NQF #1789 Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)

48//Insertion; revision; replacement; removal of cardiac pacemaker or cardioverter/defibrillator//2,541, 2.92%
 //Maintenance chemotherapy (condition CCS 45)//2,312, 2.66%
 211//Therapeutic radiology for cancer treatment//2,183, 2.51%
 3//Laminectomy; excision intervertebral disc//2,065, 2.37%
 43//Heart valve procedures//2,061, 2.37%
 152//Arthroplasty knee//1,989, 2.28%
 158//Spinal fusion//1,963, 2.25%
 55//Peripheral vascular bypass//1,902, 2.18%
 52//Aortic resection; replacement or anastomosis//1,529, 1.76%
 36//Lobectomy or pneumonectomy//1,492, 1.71%
 153//Hip replacement; total and partial//1,333, 1.53%
 60//Embolectomy and endarterectomy of lower limbs//1,263, 1.45%
 85//Inguinal and femoral hernia repair//981, 1.13%
 104//Nephrectomy; partial or complete//921, 1.06%

List of discharge condition categories that are acute or complications of care (Table 2)

Admissions in which a planned procedure was performed are only considered "planned" if the patient was not admitted for an acute illness or complication of care. Table 2 contains the list of 27 discharge condition categories considered either acute or complications of care.

Table 2: Discharge condition categories considered acute or complications of care

AHRQ CCS//Description //Number of 30-day readmissions with this condition and one of the planned procedures in the 2008 MedPAR dataset used for measure development.

237//Complication of device; implant or graft//11,689
 106//Cardiac dysrhythmias//10,267
 //Fracture (CC 207, 225, 226, 227, 229, 230, 231, 232)//6,307
 100//Acute myocardial infarction//5,643
 238//Complications of surgical procedures or medical care//5,438
 108//Congestive heart failure; nonhypertensive//5,119

 112//Transient cerebral ischemia//88
 //All condition categories//64,181

2a1.4 Denominator Statement (*Brief, narrative description of the target population being measured*):

This claims-based measure can be used in either of two patient cohorts: (1) admissions to acute care facilities for patients aged 65 years or older or (2) admissions to acute care facilities for patients aged 18 years or older. We have tested the measure in both age groups.

2a1.5 Target Population Category (*Check all the populations for which the measure is specified and tested if any*): **Adult/Elderly Care**

2a1.6 Denominator Time Window (*The time period in which cases are eligible for inclusion*):
 One year.

2a1.7 Denominator Details (*All information required to identify and calculate the target population/denominator such as definitions, codes with descriptors, and/or specific data collection items/responses*):

The ICD-9 diagnosis and procedure codes of the index admission are aggregated into clinically coherent groups of conditions/procedures (condition categories or procedure categories) by using the Agency for Healthcare Research and Quality (AHRQ) Clinical Classifications System (CCS).

Next, these discharge condition/procedure categories are organized into five mutually exclusive specialty cohorts defined by care team: surgery/gynecology, cardiorespiratory, cardiovascular neurology, and medicine.

Rationale: Conditions typically cared for by the same team of clinicians are expected to experience similar added (or reduced) levels of readmission risk.

The surgery/gynecology cohort includes admissions likely cared for by surgical or gynecological teams. These admissions are identified using AHRQ procedure categories.

The cardiorespiratory cohort includes several condition categories with very high readmission rates such as pneumonia, chronic obstructive pulmonary disease, and heart failure. These admissions are combined into a single cohort because they are often clinically indistinguishable and patients are often simultaneously treated for several of these diagnoses.

The cardiovascular cohort includes condition categories such as acute myocardial infarction that in large hospitals might be cared for by a separate cardiac or cardiovascular team.

The neurology cohort includes neurologic condition categories such as stroke that in large hospitals might be cared for by a separate neurology team.

The medicine cohort includes all non-surgical patients who were not assigned to any of the other cohorts.

See attachments (Technical Report, Section 2.4.5, Table 8, and All-Payer memo, Tables 2-6).

In order to define the eligible admissions, we first aggregated the ICD-9 codes of the index admission into clinically coherent conditions by using the Agency for Healthcare Research and Quality's Clinical Classifications Software (CCS). There are a total of 285 mutually exclusive AHRQ condition categories, most of which are single, homogenous diseases such as pneumonia or acute myocardial infarction. Some are aggregates of conditions, such as "other bacterial infections." Mental health and substance abuse categories are included. In addition, AHRQ provides 231 mutually exclusive procedure categories to group procedures a patient might have had during hospitalization.

Admissions are eligible for inclusion in the measure if:

a. Patient is aged 18 years or older

Rationale: Pediatric patients have substantially different illnesses, comorbidities and outcomes compared to an adult population.

b. Patient is alive upon discharge

Rationale: Patients who die during the initial hospitalization cannot be readmitted.

c. Patient is not transferred to another acute care hospital upon discharge

Rationale: In an episode of care in which patient is transferred among hospitals, responsibility for the readmission is assigned to the final discharging hospital. Therefore these intermediate admissions within a single episode of care are not eligible for inclusion.

Note that a readmission within 30 days will also be eligible as an index admission, if it meets all other eligibility criteria. This allows our measure to capture repeated readmissions for the same patient, whether at the same hospital or another.

2a1.8 Denominator Exclusions (*Brief narrative description of exclusions from the target population*):

We exclude from the measure all admissions for which full data are not available or for which 30-day readmission by itself cannot reasonably be considered a signal of quality of care.

Exclusions:

1. Admissions for patients without 30 days of post-discharge data

Rationale: This is necessary in order to identify the outcome (readmission) in the dataset.

2. Admissions for patients lacking a complete enrollment history for the 12 months prior to admission

Rationale: This is necessary to capture historical data for risk adjustment.

3. Admissions for patients discharged against medical advice (AMA)

Rationale: Hospital had limited opportunity to implement high quality care.

4. Admissions for patients to a PPS-exempt cancer hospital

Rationale: These hospitals care for a unique population of patients that is challenging to compare to other hospitals.

5. Admissions for patients with medical treatment of cancer (See Table 3 in Section 2a1.9)

Rationale: These admissions have a very different mortality and readmission profile than the rest of the Medicare population, and outcomes for these admissions do not correlate well with outcomes for other admissions.

(Patients with cancer who are admitted for other diagnoses or for surgical treatment of their cancer remain in the measure).

6. Admissions for primary psychiatric disease (see Table 4 in Section 2a1.9)

Rationale: Patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals.

7. Admissions for "rehabilitation care; fitting of prostheses and adjustment devices"

Rationale: These admissions are not for acute care or to acute care hospitals.

Additionally, in the all-payer testing, we excluded obstetric admissions because the measure was developed among patients aged

65 years or older (approximately 500,000).

2a1.9 Denominator Exclusion Details (All information required to identify and calculate exclusions from the denominator such as definitions, codes with descriptors, and/or specific data collection items/responses):

When the measure is applied to Medicare FFS patients, denominator exclusions are identified based on variables contained in the Standard Analytic File (SAF) or Enrollment Database (EDB). When the measure is applied to all patients aged 18 years or older, denominator exclusions are identified based on the most appropriate data source (e.g. for California, we used the California Patient Discharge Data). For Medicare FFS patients:

1. Lack of enrollment in Medicare FFS for 30 days post-discharge is identified by patient enrollment status in Part A FFS claims using CMS' EDB; the enrollment indicators must be appropriately marked for the month(s) which falls within 30 days of hospital discharge date.
2. Lack of continuous enrollment in Medicare FFS for 12 months prior to index hospital stay is determined by patient enrollment status in Part A FFS using CMS' EDB; the enrollment indicators must be appropriately marked for each of the 12 months prior to the index hospital stay
3. Discharges AMA are identified using the discharge disposition indicator within the SAF.
4. PPS-exempt cancer hospitals are identified by their Medicare provider ID.
5. Table 3 indicates all cancer discharge condition categories excluded from the measure.
6. Table 4 indicates all psychiatric discharge condition categories excluded from the measure.
7. Admissions for "rehabilitation care; fitting of prostheses and adjustment devices" are identified by principal diagnosis codes (ICD-9 codes) included in CCS 254

In addition, in-hospital deaths are identified using the discharge disposition vital status indicator in the SAF and transfers to other acute care facilities are identified in the claims when a patient is discharged from an acute care hospital and admitted to another acute care hospital on the same day or next day. Obstetric admissions were identified for exclusion from the all-payer population with the AHRQ CCS diagnosis codes 176-196.

2a1.10 Stratification Details/Variables (All information required to stratify the measure results including the stratification variables, codes with descriptors, definitions, and/or specific data collection items/responses):

This measure is not stratified.

2a1.11 Risk Adjustment Type (Select type. Provide specifications for risk stratification in 2a1.10 and for statistical model in 2a1.13): **Statistical risk model** 2a1.12 If "Other," please describe:

2a1.13 Statistical Risk Model and Variables (Name the statistical method - e.g., logistic regression and list all the risk factor variables. Note - risk model development should be addressed in 2b4.):

Hierarchical logistic regression models are used to model the log-odds of readmission within 30 days of discharge, as a function of patient-level demographic and clinical characteristics and a random hospital-level intercept. This model specification accounts for within-hospital correlation of the observed outcomes and models the assumption that underlying differences in quality among the health care facilities being evaluated lead to systematic differences in outcomes.

In brief, the approach simultaneously models two levels (patient and hospital) to account for the variance in patient outcomes within and between hospitals [1]. At the patient level, each model adjusts the log-odds of readmission within 30-days of discharge for age and selected clinical covariates. The second level models the hospital-specific intercepts as following a normal distribution. The hospital intercept represents the underlying hospital specific risk of readmission, after accounting for patient risk. If there were no differences among hospitals, then after adjusting for patient risk, the hospital intercepts should be identical across all hospitals.

We use a fixed, common set of variables in all our models for simplicity and ease of data collection and analysis. However, we estimate a hierarchical logistic regression model for each specialty cohort separately, and the coefficients associated with each variable may vary across specialty cohorts. To group ICD-9-CM codes into comorbid risk variables, we use CMS Condition

Category (CMS-CCs) groups, the grouper used in previous CMS risk-standardized outcomes measures [2]. See Table 5 for the final list of comorbid risk variables. The models also include a condition-specific indicator for all condition categories with sufficient volume (defined as those with more than 1,000 admissions nationally each year for Medicare FFS data) as well as a single indicator for conditions with insufficient volume in each model.

2a1.17-18. Type of Score: *Other* A standardized risk ratio (SRR) for each hospital and each cohort is estimated using a separate hierarchical logistic regression model for that cohort. The five SRRs, weighted by volume, are then combined into a single score which is the risk-standardized hospital-wide readmission ratio. To improve interpretation, this ratio is then multiplied by the overall national raw readmission rate for all index admissions in all cohorts to produce the risk-standardized hospital-wide readmission rate (RSSR).

2a1.19 Interpretation of Score (*Classifies interpretation of score according to whether better quality is associated with a higher score, a lower score, a score falling within a defined interval, or a passing score*): [Better quality = Lower score](#)

2a1.20 Calculation Algorithm/Measure Logic(*Describe the calculation of the measure score as an ordered sequence of steps including identifying the target population; exclusions; cases meeting the target process, condition, event, or outcome; aggregating data; risk adjustment; etc.*):

Models for each specialty cohort are specified and estimated, using a separate hierarchical logistic regression model for that cohort. Each model is then used to calculate a standardized risk ratio (SRR) for each hospital which contributes index admissions to that model. These SRRs, weighted by volume, are then pooled for each hospital to create a composite hospital-wide SRR.

For each specialty cohort within a hospital, the numerator of the SRR ("predicted") is the number of readmissions for patients within the specialty cohort within 30 days predicted on the basis of the hospital's performance with its observed case mix, and the denominator ("expected") is the number of readmissions expected for patients within the specialty cohort on the basis of the nation's performance with that hospital's case mix. This approach is analogous to a ratio of "observed" to "expected" used in other types of statistical analyses. It conceptually allows for a comparison of a particular hospital's performance given its case-mix to an average hospital's performance with the same case-mix. Thus, an SRR less than 1 indicates lower-than-expected readmission or better quality and an SRR greater than 1 indicates higher-than-expected readmission or worse quality.

These SRRs are then pooled for each hospital to create a composite hospital-wide SRR. This pooled SRR is the geometric mean of the specialty cohort SRRs, weighted by the number of admissions in the specialty cohort, and the pooled SRR is then multiplied by the overall crude readmission rate to produce the risk standardized readmission rate (RSRR) for reporting. Please see attachment (Technical Report, Section 2.6) for more details on the calculation algorithm.

2a1.24 Sampling (Survey) Methodology. If measure is based on a sample (or survey), provide instructions for obtaining the sample, conducting the survey and guidance on minimum sample size (response rate):

[N/A –This measure is not based on a sample or survey.](#)

2a1.25 Data Source (*Check all the sources for which the measure is specified and tested*). If other, please describe:

[Administrative claims](#)

2a1.26 Data Source/Data Collection Instrument (*Identify the specific data source/data collection instrument, e.g. name of database, clinical registry, collection instrument, etc.*): [Administrative Claims](#)

[The following data sources were used to develop the measure in the aged 65 and over Medicare FFS population:](#)

Index admissions were identified in the Medicare Part A inpatient claims data (2008) from the Medicare Provider Analysis and Review (MedPAR) file. Comorbid conditions for risk adjustment were identified via Medicare Part A inpatient claims in the 12 months prior to and including the index hospital stay.

Readmissions were identified via Part A inpatient data. Enrollment status was obtained from the Medicare enrollment database which contains beneficiary demographic and benefit/coverage information.

(Note: The measure was developed using AHRQ condition and procedure CCS groupings based on ICD-9 codes. AHRQ condition CCS groupings with ICD-10 codes are attached under 2a1.27. Data Source or Collection Instrument Reference. AHRQ procedure CCS and CMS-CC groupings with ICD-10 codes will be appended to application when available.)

The measure was subsequently applied to 2005-2007 California Patient Discharge Data (CPDD), a large, linked all-payer database of patient hospital admissions. Records in this database are linked by a unique patient identification number, allowing us to determine patient history from previous hospitalizations as well as risk of readmission within 30 days. In 2006, these data include approximately 3 million adult discharges from more than 450 non-Federal acute care hospitals.

For purposes of analysis, we divided CPDD data into three cohorts based on age and insurance: Medicare FFS patients aged 65 years or older, all other patients aged 65 years or older, and all patients aged over 65 years. The Medicare FFS 65 years or older cohort is equivalent to our original dataset, which includes only Medicare FFS patients aged 65 years or older. We compared:

1. Unadjusted readmission rates for the five specialty cohorts in the CPDD to national Medicare FFS data
2. The frequencies of risk variables in patients aged over 65 years, aged 65 years or older with FFS Medicare, and aged 65 years or older without FFS Medicare in the CPDD to national Medicare FFS data
3. The distribution of discharge condition categories in patients aged over 65 years, aged 65 years or older with FFS Medicare, and aged 65 years or older without FFS Medicare in the CPDD to one another
4. The performance of models using CPDD data to the performance of models using national FFS Medicare data

The performance of models using CPDD data to the performance of models in which 31 interactions of age =65 * each comorbid risk variable were added to each specialty cohort model. This analysis allowed us to determine whether comorbid risk variables behave differently in younger versus older patients.

2a2. Reliability Testing. (Reliability testing was conducted with appropriate method, scope, and adequate demonstration of reliability.)

2a2.1 Data/Sample (Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

We used Medicare Part A inpatient claims data from calendar years 2007, 2008, and 2009 to test model reliability. Pooled data from 2007 and 2008 were randomly split into two datasets: the first was used as the development sample while the second was used for reliability testing. Another dataset corresponding to the full-year 2009 was used to assess stability over time.

2007-2008 split-year dataset (used for reliability testing):

Medicine model: 3,082,357 hospital stays at 4,946 hospitals
 Surgery/gynecology model: 2,208,482 hospital stays at 4,353 hospitals
 Cardiorespiratory model: 1,396,855 hospital stays at 4,806 hospitals
 Cardiovascular model: 861,925 hospital stays at 4,703 hospitals
 Neurology model: 461,262 hospital stays at 4,686 hospitals

2009 full-year dataset (used for assessing stability over time):

Medicine model: 3,032,518 hospital stays at 4,908 hospitals
 Surgery/gynecology model: 2,109,292 hospital stays at 4,232 hospitals
 Cardiorespiratory model: 1,331,539 hospital stays at 4,718 hospitals
 Cardiovascular model: 809,520 hospital stays at 4,641 hospitals
 Neurology model: 452,743 hospital stays at 4,609 hospitals

2a2.2 Analytic Method (*Describe method of reliability testing & rationale*):

Data element reliability

In constructing the measure, we aimed to utilize only those data elements from the claims that have both face validity and reliability. We avoid the use of fields that are thought to be coded inconsistently across hospitals or providers. Specifically, we use fields that are consequential for payment and which are audited. We identify such variables through empiric analyses and our understanding of CMS auditing and billing policies and seek to avoid variables which do not meet this standard. For example, "discharge disposition" is a variable in Medicare claims data that is not thought to be a reliable variable for identifying a transfer between two acute care facilities. Thus, we derive a variable using admission and discharge dates as a surrogate for "discharge disposition" to identify hospital stays involving transfers. This allows us to identify these stays using variables in the claims data which have greater reliability than the "discharge disposition" variable.

In addition, CMS has in place several hospital auditing programs used to assess overall claims code accuracy, to ensure appropriate billing, and for overpayment recoupment. CMS routinely conducts data analysis to identify potential problem areas and detect fraud, and audits important data fields used in our measures, including diagnosis and procedure codes and other elements that are consequential to payment.

Finally, we assess the reliability of the data elements by comparing risk factor frequencies and odds ratios in two data sets constructed from Medicare FFS data.

Measure result reliability

The reliability of a measurement is the degree to which repeated measurements of the same entity agree with each other. For measures of hospital performance, the measured entity is naturally the hospital, and reliability is the extent to which repeated measurements of the same hospital give similar results. In line with this thinking, our approach to assessing reliability is to consider the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance. That is, we take a "test-retest" approach in which hospital performance is measured once using a random subset of patients, then measured again using a second random subset exclusive of the first, and the agreement of the two resulting performance measures compared across hospitals [1].

For test-retest reliability of the measure in Medicare FFS patients aged 65 and older, we combined index admissions from successive measurement periods into one dataset, randomly sampled half of patients within each hospital, calculated the measure for each hospital, and repeated the calculation using the second half. Thus, each hospital is measured twice, but each measurement is made using an entirely distinct set of patients. To the extent that the calculated measures of these two subsets agree, we have evidence that the measure is assessing an attribute of the hospital, not of the patients. As a metric of agreement we calculated the intra-class correlation coefficient [2] and assessed the values according to conventional standards [3]. Specifically, we used a combined 2007-2008 data sample, randomly split it into two approximately equal subsets of patients (equivalent of one year of volume for each split sample), and calculated the RSRR for each hospital for each sample. The agreement of the two RSRRs was quantified using the intra-class correlation as defined by ICC (2,1) by Shrout and Fleiss (1979) [2].

Using two independent samples provides an honest estimate of the measure's reliability, compared with using two random but potentially overlapping samples which would exaggerate the agreement. We elected to use a full year's data in each sample

(randomly split from a combined two-year dataset) given that we recommend reporting the measure for a one-year period.

2a2.3 Testing Results (*Reliability statistics, assessment of adequacy in the context of norms for the test conducted*):

Data element reliability

No notable differences were observed in risk variable frequency or odds ratios (ORs) across the Medicare FFS datasets. See attachment (Technical Report, Section 3.2, Tables 14-18)

Measure result reliability

The agreement between the two independent assessments of each hospital in Medicare FFS data was 0.881, which according to the conventional interpretation is "almost perfect" [1].

2b. VALIDITY. Validity, Testing, including all Threats to Validity: H M L I

2b1.1 Describe how the measure specifications (*measure focus, target population, and exclusions*) **are consistent with the evidence cited in support of the measure focus** (*criterion 1c*) **and identify any differences from the evidence:**

N/A This is an outcome measure.

2b2. Validity Testing. (*Validity testing was conducted with appropriate method, scope, and adequate demonstration of validity.*)

2b2.1 Data/Sample (*Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)

The HCAHPS survey is the first national, standardized, publicly reported survey of patients' perspectives of hospital care.

Developed by AHRQ and CMS, it was endorsed by NQF in 2005. The HCAHPS survey is administered to a random sample of adult patients (18 years and older) across medical and surgical conditions between 48 hours and six weeks after discharge; the survey is not restricted to Medicare beneficiaries. The response rate of the survey is not ideal (average of 34%), but studies have shown that this does not affect the validity of survey results and the correlation to readmission rates [1-2].

Thomson Reuters Top 100 Hospitals

Thomson Reuters annually names 100 Top Hospitals based on facility-wide performance among short-term, acute-care, nonfederal US hospitals. Hospitals do not apply and winners do not pay to market this honor. Critical access hospitals are excluded. Data sources include the MedPAR dataset, the Medicare Cost Report, HCAPS survey data, core measures from CMS Hospital Compare dataset, the American Medical Association, and the American Osteopathic Association (AOA). The top performers are selected based on a set of measures including:

- Risk-adjusted mortality index
- Risk-adjusted complications index
- Risk-adjusted patient safety index
- Core measures score
- 30-day mortality rate
- 30-day risk-adjusted readmission rate
- Severity-adjusted average length of stay
- Case mix- and wage-adjusted inpatient expense per adjusted discharge
- Profitability (operating profit margin)
- HCAHPS score (patient rating of overall hospital performance)

Thomson Reuters also incorporates the direction of performance change over time.

The Joint Commission's Top Performers on Key Quality Measures program

In September 2011, The Joint Commission released the Top Performers on Key Quality Measures program, which recognizes accredited hospitals and critical access hospitals have consistently superior performance (>95%) on clinical process measures for

heart attack, heart failure, pneumonia, surgical care and children's asthma. In 2011, 405 hospitals were recognized, which represent the top 14 percent of Joint Commission accredited hospitals reporting data.

2b2.2 Analytic Method (*Describe method of validity testing and rationale; if face validity, describe systematic assessment*): Measure validity is demonstrated through prior validity testing done on our other claims-based measures and through use of established measure development guidelines.

Validity of Claims Data:

Our team has demonstrated for a number of prior measures the validity of claims-based measures for profiling hospitals by comparing either the measure results or individual data elements against the corresponding results and elements from medical records. CMS validated the six NQF-endorsed measures currently in public reporting (AMI, heart failure, and pneumonia mortality and readmission) with models that used chart-abstracted data for risk-adjustment. Specifically, claims model validation was conducted by building comparable models using abstracted medical chart data for risk adjustment for AMI patients (Cooperative Cardiovascular Project data) [1], heart failure patients (National Heart Failure data) [2,3], and pneumonia patients (National Pneumonia Project dataset) [4]. When both models were applied to the same patient population, the hospital risk-standardized rates estimated using the claims-based risk adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting.

We have also completed two national, multi-site validation efforts for two procedure-based complications measures (for primary elective hip/knee arthroplasty and implantable cardioverter defibrillator [ICD]). Both projects demonstrated strong agreement between complications coded in claims and abstracted medical chart data. These validation efforts suggest that such claims data variables are valid across a variety of conditions.

Validity Indicated by Established Measure Development Guidelines:

We developed this measure in consultation with national guidelines for publicly reported outcomes measures, with outside experts, and with the public. The measure is consistent with the technical approach to outcomes measurement set forth in National Quality Forum (NQF) guidance for outcomes measures [5], CMS Measure Management System guidance, and the guidance articulated in the American Heart Association scientific statement, "Standards for Statistical Models Used for Public Reporting of Health Outcomes" [6].

Validation Against Other Outcomes Measures:

In order to test the construct validity of the HWR measure, we examined whether hospitals considered "top performers" according to other measures and ranking systems had lower hospital-wide risk-standardized readmission rates than remaining hospitals when applying our measure to the Medicare FFS population. This type of validity testing tests the assumption that hospitals considered top performers have developed an organizational culture of excellence that will manifest itself in better outcomes including lower hospital-wide readmission rates. However, there are multiple challenges associated with this approach:

1. There are many measures and ranking systems available, using a variety of criteria in order to define and select top performers, including: adherence to core processes of care, complications and safety indexes, resource utilization, outcomes, patient satisfaction, and even reputation. "Top performers" on one measure are not the same as "top performers" on another. Moreover, most of these measures are not themselves validated.
2. In many cases, the methodology for identifying "top performers" is proprietary and not transparent.
3. The starting set of hospitals from which different ranking systems select the top performers usually includes only a subset of all acute care hospitals included in the HWR measure; in most cases it is not possible to replicate this starting set exactly.
4. We have not found a ranking system which specifically measures factors most relevant to readmission risk, such as medication reconciliation, patient education, post-discharge follow up, or communication with outpatient clinicians.

After reviewing ranking systems, we selected the following three to use for construct validity testing, because they are widely used and their methodology is available to the public:

1. HCAHPS survey score

<http://www.hcahponline.org/home.aspx>

2. Thomson Reuters 100 top hospitals

<http://www.100tophospitals.com/top-national-hospitals/>

3. Joint Commission list of Top Performers on Key Quality Measures

http://www.jointcommission.org/assets/1/18/Top_Performers_2010_list_9_13_11.pdf

1. Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)

From the 27 questions in the HCAHPS survey, we selected seven that we felt were most likely to be correlated with readmission rates, based on clinical judgment and on previously reported results by others [7, 8]. Based on previous results we expected to see that patient satisfaction is significantly correlated with hospital readmission rates. For this analysis, we compared 2009 HCAHPS results to 2009 Medicare FFS RSRRs. See results in Table 6 in Section 2b2.3.

2. Thomson Reuters Top 100 Hospitals

Given that this measure includes several elements theoretically related to readmission risk, including complications, patient safety, readmissions, and HCAHPS, we felt this measure was a reasonable candidate for construct validity testing. However, since the measure also contains other components such as core measures, expenses and profitability, that would not be expected to correlate with readmission, we expected the analysis to show at best small improvements in readmission performance among top performers. See results in Table 7 in Section 2b2.3.

3. The Joint Commission's Top Performers on Key Quality Measures program

Of the Joint Commission's list of 405 top performers, we selected only those 158 hospitals with superior performance in all four adult measure sets (HWR is for patients 18 years and older), on the assumption that these hospitals demonstrated hospital-wide performance excellence. We calculated their hospital-wide readmission rates and compared them to those of other hospitals. However, since numerous studies have shown that there is little relationship between performance on core process measures and outcomes including mortality and readmission rates [9-15], we expected the Joint Commission's top performers to have similar risk-standardized readmission rates as other hospitals. See results in Table 8 in Section 2b2.3.

2b2.3 Testing Results (*Statistical results, assessment of adequacy in the context of norms for the test conducted; if face validity, describe results of systematic assessment*):

1. Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)

Table 6 shows the correlation (Pearson correlation coefficient) between RSRR and the proportion of patients who responded in that given manner to the question. The analysis includes the 3,723 hospitals that publicly report HCAHPS results.

Table 6: Correlation between RSRR (2009 Medicare FFS data) and HCAHPS response (N=3,723 hospitals)

HCAHPS Question//Correlation

Pain was 'sometimes' or 'never' well controlled//0.34

Patients 'sometimes' or 'never' received help as soon as they wanted//0.34

Nurses 'sometimes' or 'never' communicated well//0.33

'NO' patients would not recommend the hospital//0.32

Patients were 'sometimes' or 'never' given information about what to do during their recovery at home//0.32

Patients who gave a rating of '6' or lower//0.31

Doctors 'sometimes' or 'never' communicated well//0.23

p value for all correlations <0.001

The results show that all the negative answers were significantly correlated with readmission rates - that is, that lower patient satisfaction level is associated with higher RSRR, as expected.

2. Thomson Reuters Top 100 Hospitals

Table 7 shows the RSRRs distribution for the top performers in comparison to the rest of hospitals.

Table 7: Distribution of RSRRs (2009 Medicare FFS data) for the Thomson Reuters Top 100 Hospitals vs. others

Top 100 list//N Obs//Mean//SD//Minimum//Lower quartile//Median//Upper quartile//Maximum

No//3017//16.65//1.28//12.51//15.79//16.51//17.35//22.69

Yes//100//16.19//1.39//13.77//15.05//16.06//16.99//19.81

The mean RSRR for the top performers is lower than the mean RSRR for hospitals not on the list (16.19 versus 16.65). The magnitude of difference is approximately 0.5%, as we had expected, and in the right direction.

3. The Joint Commission's Top Performers on Key Quality Measures program

Table 8 shows the distribution of risk-standardized readmission rates of the 158 top performers compared to other hospitals.

Table 8: Distribution of RSRR (2009 Medicare FFS data) for The Joint Commission's Top Performers vs. Others

Top Performers List//N Obs//Variable//Mean//SD//Minimum//Lower quartile//Median//Upper quartile //Maximum

Not in List//4630//RSRR//16.61//1.16//12.51//15.87//16.49//17.21//22.69

In List//158//RSRR//16.66//0.99//14.18//16.01//16.64//17.17//19.91

The mean RSRR for Joint Commission top performing hospitals was 16.66 versus 16.61 for the remaining hospitals in our measure cohort. The absence of difference was consistent with our a priori expectation based on published studies.

In summary, these three construct validity analyses demonstrated results consistent with our expectations. There is a significant correlation between patient satisfaction and RSRR as measured by HWR measure. "Top performers" as defined by Thomson Reuters have lower RSRRs as measured by HWR measure. On the other hand, hospitals identified by The Joint Commission as having superior performance on all four categories of clinical process measures have identical performance as those with lower performance, consistent with published studies.

POTENTIAL THREATS TO VALIDITY. (*All potential threats to validity were appropriately tested with adequate results.*)

2b3. Measure Exclusions. (*Exclusions were supported by the clinical evidence in 1c or appropriately tested with results demonstrating the need to specify them.*)

2b3.1 Data/Sample for analysis of exclusions (*Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

In measure development we used Medicare claims for calendar year 2008 to identify eligible admissions for inclusion in the measure. The total number of hospitalizations for patients 65 and older was 9,111,515, of which 8,546,784 involved patients who survived to discharge and were discharged to an acute care setting. An additional 588,883 admissions were excluded for the following reasons:

- 1- We excluded 26,374 hospitalizations without at least 30-day post-discharge enrollment in Medicare FFS. The 30-day follow-up after discharge is necessary to identify the outcome (readmission) in the dataset.
- 2- We excluded 311,076 hospitalizations with incomplete administrative data in 12 months prior to or during the index hospitalization. Complete data is required for adequate risk-adjustment.
- 3- We excluded 29,421 hospitalizations discharged against medical advice.
- 4- We excluded 19,832 hospitalizations occurring in a PPS-Exempt cancer hospital.
- 5- We excluded 195,446 hospitalizations corresponding to patients undergoing medical cancer treatment. See rationale for excluding these patients in the next paragraph under 2b3.2.
- 6- We excluded an additional 23,018 hospitalizations with primary psychiatric diagnoses (CCS 650, 651, 652, 654, 655, 656, 657, 658, 659, 662, and 670). Patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals.
- 7- We excluded 9,274 hospitalizations for rehabilitation care (CCS 254) (since they were not for acute care or to acute care hospitals).

For our all-payer testing, we used the California Patient Discharge Data (CPDD), a large database of patient hospital admissions, for our all-payer data. In 2006, these data include approximately 3 million adult discharges from more than 450 non-Federal acute care hospitals.

NQF #1789 Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)

We applied the same inclusion and exclusion criteria that we applied to national Medicare data with the following minor modifications:

- We changed the minimum eligible age from 65 to 18
- We removed the requirement to be enrolled in Medicare FFS
- Because the HWR measure was specified without obstetric admissions, we excluded obstetric admissions (approximately 500,000).

The resulting 2006 CPDD all-payer testing dataset included 1,969,861 eligible admissions.

2b3.2 Analytic Method (Describe type of analysis and rationale for examining exclusions, including exclusion related to patient preference):

In this paragraph we summarize the rationale and results of analyses performed that led us to exclude hospitalizations of patients admitted for the medical treatment of their cancers. We initially developed a separate specialty cohort for patients admitted with a principal diagnosis condition of cancer who did not undergo a major surgical procedure using Medicare FFS data. These are patients undergoing medical treatment of their cancer. We found that this cohort had more than twice the post-discharge mortality of any other cohort, indicating substantial competing risk of mortality in the post-discharge period. Such competing mortality risk raises concern that readmission by itself is not an ideal quality indicator for this population. Furthermore this cohort had a planned readmission rate six times that of any other cohort – 41% of readmissions in this cohort were considered planned – raising concern that readmission in this population is a different phenomenon than for other cohorts. Most importantly, this cohort's standardized readmission ratio (SRR) was poorly correlated with the composite hospital-wide SRR, especially compared to other cohorts (Table 9). As a consequence, the internal consistency of the measure (Cronbach's alpha) improved substantially when the cancer treatment cohort was removed (Table 9). Therefore, we elected to exclude this subset of cancer patients from the measure altogether. It is important to note that patients with secondary diagnoses of cancer admitted for other reasons are still included in this measure based on discharge diagnosis condition or procedure (i.e. a patient with a secondary diagnosis of lung cancer who was admitted with pneumonia would be in the cardiorespiratory cohort; a patient admitted for partial colectomy to treat colon cancer would be in the surgical cohort).

Table 9– Correlation of condition SRRs with composite SRRs (Medicare FFS data)
Model //Correlation with overall composite score

Medicine//0.732
Surgery/gynecology//0.652
Cardiorespiratory//0.663
Cardiovascular//0.541
Neurology//0.553
Cancer treatment//0.228

2b3.3 Results (Provide statistical results for analysis of exclusions, e.g., frequency, variability, sensitivity analyses):

Table 10 shows the total number of hospitalizations, unplanned and planned readmissions after all inclusion and exclusion criteria were applied to the aged 65 and over Medicare FFS population. Psychiatric and medical treatment cancer hospitalizations excluded represented only 1.3% of all hospitalizations and 1.8% of all unplanned readmissions captured by the measure.

Table 10 – Admissions, readmissions and mortality for the five cohorts (2008 Medicare FFS data)

2b4. Risk Adjustment Strategy. *(For outcome measures, adjustment for differences in case mix (severity) across measured entities was appropriately tested with adequate results.)*

2b4.1 Data/Sample *(Description of the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):*

We used Medicare claims for calendar year 2008, with 12 months history data (i.e., 2007), to select risk variables. See Denominator details Section (2a1.7.). Comorbidities were assessed using data from the index admission and any admission in past year. Risk adjustment was assessed using pooled data from 2007 and 2008 randomly split into two samples, and full year 2009 dataset.

For all-payer testing, we used the 2006 CPDD all-payer dataset of 1,969,861 eligible admissions.

2b4.2 Analytic Method *(Describe methods and rationale for development and testing of risk model or risk stratification including selection of factors/variables):*

Because the risk of readmission varies with patient factors, including age and comorbidities, hospital comparisons using readmission rates need to account for differences in these factors. Because the service mix of hospitals also varies widely, the measure also adjusted for the AHRQ condition category of the patient's primary discharge diagnoses (discharge condition category), except for rare condition categories.

1. The HWR risk-adjustment models use only inpatient claims data (history and current) in order to make it feasible to implement with Medicare data, and to make it applicable to all-payer data, which are typically restricted to inpatient claims. The impact of not including outpatient data (Part B) on model performance has been studied for 6 publicly reported outcome measures (AMI, HF, and pneumonia 30-day risk-standardized mortality and readmission rates) and the results reported in a separate memo to CMS [1].

The results showed that in absence of part B data, the prevalence of most risk factors was lower, while the magnitude of effect for most risk factors was similar. A reclassification analysis comparing a model with full data to a model with only admission claims data demonstrated good patient-level risk prediction: for all six measures, over 95% of patients were in a similar risk category regardless of risk-adjustment dataset, and the integrated discrimination improvement (IDI) values were relatively low. The models' c-statistics were also similar between the two approaches (0.713 vs. 0.725 for AMI mortality; 0.681 vs. 0.684 for HF mortality; 0.713 vs. 0.719 for pneumonia mortality; 0.619 vs. 0.614 for AMI readmission; 0.610 vs. 0.611 for HF readmission; and 0.632 vs. 0.628 for pneumonia readmission). Finally when comparing the model with full data and with only admission claims data, hospital-level risk-standardized rates were highly correlated (ICC=0.984 for AMI mortality; ICC=0.993 for HF mortality; ICC=0.989 for pneumonia mortality; ICC=0.950 for AMI readmission; ICC=0.978 for HF readmission; and ICC=0.985 for pneumonia readmission).

Consequently we expect that using only inpatient data in this measure has had minimal impact on model performance and predictive ability.

2-The HWR measure uses CMS-CCs [2], the grouper used in previous CMS risk-standardized outcomes measures, to group ICD-9-CM codes into comorbid risk adjustment variables, since four CMS condition-specific claims-based readmission models that use this grouper to define variables for risk adjustment have been validated against models that use chart-abstracted data for risk adjustment [3-5].

3-In order to select the comorbid risk variables, we developed a "starter" set of 30 variables drawn from previous readmission measures (AMI, heart failure, pneumonia, hip and knee arthroplasty, and stroke). Next we reviewed all the remaining CMS-CCs and determined on a clinical basis whether they were likely to be relevant to an all-condition measure. We selected 11 additional risk variables to consider.

Using data from the index admission and any admission in the prior 12 months, we ran a standard logistic regression model for every discharge condition category with the full set of candidate risk adjustment variables. We compared odds ratios for different variables across different condition categories (excluding condition categories with fewer than 700 readmissions due to the number of events per variable constraints). We selected the final set of comorbid risk variables based on the following principles:

- i. We excluded risk variables that were statistically significant for very few condition categories, given that they would not contribute much to the overall models.
- ii. We excluded risk variables that behaved in clinically incoherent ways. For example, we dropped risk variables that

sometimes increased risk and sometimes decreased risk, when we could not identify a clinical rationale for the differences.

iii. We excluded risk variables that were predominantly protective when we felt this protective effect was not clinically reasonable but more likely reflected coding factors. For example, drug/alcohol abuse without dependence (CC 53) and delirium and encephalopathy (CC 48) were both protective for readmission risk although clinically they should increase patients' severity of illness. It is possible these variables appeared falsely protective because they were coded more often in healthier patients who had few other comorbidities than in sicker patients who had more competing comorbidities to include in the billing form.

iv. Where possible, we grouped together risk variables that were clinically coherent and carried similar risks across condition categories. For example, we combined coronary artery disease (CCs 83-84) with cerebrovascular disease (CCs 98, 99, and 103).

v. We examined risk variables that had been combined in previous CMS publicly reported measures, and in one instance separated them: for cancers, the previous measures generally pool 5 categories of cancers (CCs 8 to 12), together. In our analysis, lung cancer (CC 8) and other severe cancers (CC 9) carried higher risks, so we separated them into a distinct risk variable and grouped other major cancers (CC 10), benign cancers (CC 11), and cancers of the urinary and GI tracts (CC 12) together. Consistent with other publicly reported measures, we also left metastatic cancer/leukemia (CC 7) as a separate risk variable.

See Table 5 in Section 2a1.13 for the final list of risk variables.

4- Complications occurring during hospitalization are not comorbid illnesses, may reflect hospital quality of care, and therefore should not be used for risk adjustment. Hence, conditions that may represent adverse outcomes due to care received during the index hospital stay are not included in the risk-adjusted model; see Table 5 in Section 2a1.13. CCs on this list were not counted as a risk variable in our analyses if they appeared only on the index admission.

5- Service mix adjustment: The measure includes many different discharge condition categories that differ in their baseline readmission risks. In addition, hospitals differ in their relative distribution of these condition categories (service mix). To adjust for service mix, the measure uses an indicator variable for the discharge condition category in addition to risk variables for comorbid conditions. The models also include a condition-specific indicator for all condition categories with sufficient volume (defined as those with more than 1,000 admissions nationally each year for Medicare FFS data) as well as a single indicator for conditions with insufficient volume in each model.

6- Multiple models vs. a single model: Risk adjustment for this measure is complicated by the fact that it includes many different discharge condition categories. Rather than assume that the effect of risk variables would be homogeneous across all discharge condition categories, we assessed the performance of a single model versus multiple models of groups of condition categories. Our analyses showed consistently that a single model was slightly inferior to multiple models for specialty cohorts in terms of discrimination and predictive ability for readmission risk (Table 11). The IDI (Integrated Discrimination Improvement) score for the multiple model regression analysis was 0.001, $P < 0.001$ [6].

Table 11: C statistics for single model and multiple models (Medicare FFS data)

Modeling approach//C statistic//95% confidence interval

Single overall model//0.656//0.655-0.656

Five models combined//0.658//0.657-0.658

Another consideration in grouping discharge condition categories into models for specialty cohorts rather than into a single model was that the readmission risk varies according to discharge condition as well as according to age and comorbidities. Hospitals vary in their mix of conditions and procedures ("service mix"). By modeling readmission separately for different groups of conditions or procedures, we can better account for differences in service mix across hospitals. In addition, the multiple model approach, which combines individual measures from each model into a single measure, may increase the practical utility of the measure by providing condition or service line readmission information to hospitals.

Our analyses found that even within the same discharge condition, patient risk was strongly affected by whether a surgical procedure was performed during hospitalization. Patients undergoing surgical procedures typically had better outcomes than patients who did not undergo a procedure but were admitted with the same discharge condition. Examples are shown in Table 12.

Table 12: Example readmission rates for admissions with and without surgical procedures (Medicare FFS data)

CCS//Description//Without surgical procedure: total admits, total readmits, readmit rate//With surgical procedure: total admits, total readmits, readmit rate

100//Acute myocardial infarction//116,810, 25,035, 21.40%//80,208, 13,197, 16.50%

149//Biliary tract disease//33,718, 5,443, 16.10%//66,034, 7,444, 11.30%

205//Spondylosis; intervertebral disc disorders; other back problems//46,916, 7,395, 15.80%//103,542, 7,693, 7.40%

237//Complication of device; implant or graft//81,549, 18,771, 23.00%//108,171, 17,096, 15.80%

Therefore, we determined that a single model with adjustment for diagnosis condition would not perform as well as an approach that separated admissions with surgical procedures from admissions without surgical procedures.

In theory, estimating a single model for each of the 285 condition categories would provide the best discrimination of readmission risk at the patient level. However, if we did so, many hospitals would not be included in most such models; for all but the most common discharge condition categories, many hospitals would not have an index admission in that category during a given year. In addition, most other hospitals would have only very small numbers of index admissions in each discharge condition category, meaning that the model would contribute very little to their overall measurement.

7-Models were defined based on service line (care team): we organized hospitalizations into 5 mutually exclusive cohorts: general medicine, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology. We built a separate model for each one of the condition cohorts. We decided to use a common set of variables in all our models for simplicity and ease of data collection and analysis.

8- Standardized risk ratio for each specialty cohort and hospital-wide RSRR: Using hierarchical logistic regression model, a standardized risk ratio (SRR) was calculated in each hospital for each cohort of condition as the ratio of predicted (P) over expected (E) readmission events. Each hospital's SRRs were then combined into a single score, weighted by number of admissions. See attachment (Technical Report, Section 2.6) for a detailed description of the algorithm for calculating P, E, SRR, and the pooled ratio. To improve interpretation, this ratio was then multiplied by the overall unadjusted national readmission rate for all index admissions in all cohorts to produce the risk-standardized hospital-wide readmission rate (RSRR).

 Assessment of risk adjustment

For all three Medicare FFS datasets, we computed five summary statistics for assessing model performance [7]:

(1) over-fitting indices (over-fitting refers to the phenomenon in which a model describes the relationship between predictive variables and outcome well in the development dataset, but fails to provide valid predictions in new patients)

(2) predictive ability (measures the ability to distinguish high-risk subjects from low-risk subjects)

(3) area under the receiver operating characteristic (ROC) curve (a measure of how accurately a statistical model is able to distinguish between patient with and without an outcome)

(4) distribution of residuals

(5) model chi-square: a test of statistical significance usually employed for categorical data to determine whether there is a good fit between the observed data and expected values; i.e., whether the differences between observed and expected values are attributable to true differences in characteristics or instead the result of chance variation. The formula for computing the chi-square is as follows:

$$\text{SUM } [(O-E)^2/E]$$

where O = observed value, E = expected value, and degrees of freedom (df) = (rows-1)(columns-1)

Assessment of risk adjustment in the 18 or older population

For this analysis, we divided CPDD data into three cohorts based on age and insurance: Medicare FFS patients aged 65 years or older, all other patients aged 65 years or older, and all patients aged over 65 years. The Medicare FFS ≥65 cohort is equivalent to our original dataset, which includes only Medicare FFS patients aged 65 years or older.

We compared:

- 1) Unadjusted readmission rates for the five specialty cohorts in the CPDD to national Medicare FFS data
- 2) The frequencies of risk variables in patients aged 65 years or older, aged 65 years or older with FFS Medicare, and aged 65 years or older without FFS Medicare in the CPDD to national Medicare FFS data
- 3) The distribution of discharge condition categories in patients aged 65 years or older, aged 65 years or older with FFS Medicare, and aged 65 years or older without FFS Medicare in the CPDD to one another
- 4) The performance of models using CPDD data to the performance of models using national FFS Medicare data
- 5) The performance of models using CPDD data to the performance of models in which 31 interactions of age =65 * each comorbid risk variable were added to each specialty cohort model. This analysis allowed us to determine whether comorbid risk variables behave differently in younger versus older patients.

Results of these five analyses are summarized below and provided in detail in the attached report.

2b4.3 Testing Results (*Statistical risk model*): Provide quantitative assessment of relative contribution of model risk factors; risk model performance metrics including cross-validation discrimination and calibration statistics, calibration curve and risk decile plot, and assessment of adequacy in the context of norms for risk models. (*Risk stratification*): Provide quantitative assessment of relationship of risk factors to the outcome and differences in outcomes among the strata):

Summary of Medicare FFS aged 65 and over results:

Results were calculated using standard logistic regression models. Frequency of risk variables and the odds ratios with 95% confidence intervals for readmission risks are shown in the attached Technical Report (Tables 9-13, Section 3.1). Each table shows results for a single model and each table contains results from two datasets (pooled data from 2007 and 2008 randomly split into two parts). Results of risk adjustment assessment are shown in Tables 14 through 18 in the attached Technical Report (Section 3.2). Each table contains data from three Medicare FFS datasets. As described above, over-fitting refers to the phenomenon in which a model describes the relationship between predictive variables and outcome well in the development dataset, but fails to provide valid predictions in new patients. Since the gamma0 in the validation sample is close to zero and the gamma1 is close to one in each of the models, there is little evidence of over-fitting. Discrimination in predictive ability measures the ability to distinguish high-risk subjects from low-risk subjects. Therefore, we would hope to see a wide range between the lowest decile and highest decile, which these models show. The ROC is a measure of how accurately a statistical model is able to distinguish between patients with and without the outcome (readmission). The range of ROC results is 0.613 to 0.675 which is in line with results we have seen for other 30-day readmission measures.

Summary of all-payer testing results:

Analysis #1: Unadjusted readmission rates (See attached All-Payer Memo, Tables 1-6)

- In all five specialty cohorts, unadjusted readmission rates for Medicare FFS patients aged 65 years or older in the CPDD from 2006 were very similar to unadjusted readmission rates for Medicare FFS patients aged 65 years or older admitted to California hospitals in CMS national data from 2007, indicating that the CPDD data appropriately captured Medicare patients.
- In all five specialty cohorts, unadjusted readmission rates were highest in Medicare FFS patients aged 65 years or older, and lowest in patients aged under 65 years, as expected.

Analysis #2: Frequencies of comorbid risk variables (See attached All-Payer Memo, Tables 7-11):

- In all five specialty cohorts, the frequencies of risk variables in California Medicare FFS patients aged 65 years or older were very similar to those in national Medicare FFS patients, even though the CPDD includes many more comorbidity codes.
- In all five specialty cohorts, comorbid risk variable frequency in California Medicare FFS patients aged 65 years or older was similar to comorbid risk variable frequency in all other California patients aged 65 years or older.
- Younger CPDD patients had different rates of comorbid illness than older CPDD patients in all five specialty cohorts. Younger patients, for example, had much higher rates of alcohol and substance abuse and lower rates of cardiovascular disease.

Analysis #3: Frequencies of discharge condition categories (See attached All-Payer Memo, Tables 12-16):

- In all five specialty cohorts, the distribution of discharge conditions within specialty cohorts was similar for California Medicare FFS patients aged 65 years or older and all other CPDD patients aged 65 years or older.
- Younger CPDD patients had substantially different distributions of disease than older CPDD patients in all five specialty cohorts. For example, in the cardiovascular cohort, half the younger patients had a diagnosis of chest pain, compared to only one quarter of older patients.

Analysis #4: Performance of the Models. (See attached All-Payer Memo, Table 17)

Table 17 in the attached All-Payer Memo contains model performance results for the all-payer data. Model performance for younger patients was significantly better than for patients aged 65 years or older in every specialty cohort. As shown in Table 13 below, every specialty cohort model performed better in all-payer data than in our original derivation set using national Medicare data:

Table 13. ROC comparison across samples

Specialty cohort	2007-2008 Medicare FFS Development Sample	2007-2008 Medicare FFS Validation Sample	CPDD Sample
Cardiovascular model	0.657	0.656	0.715
Cardiorespiratory model	0.63	0.631	0.674
Neurology model	0.614	0.613	0.661
Medicine model	0.64	0.641	0.702
Surgical model	0.675	0.675	0.725

Analysis #5: Improvement using interaction terms.

Adding an interaction term of age =65 * each comorbid risk variable for every comorbid risk variable (N=31) did not appreciably improve the performance of any specialty cohort model, indicating that comorbid risk variables do not behave substantively differently for younger versus older patients

Summary of all-payer testing results

Despite substantial differences in both comorbid risk variable frequencies and disease distribution between younger and older patients, we observed little difference in risk variable performance between younger and older patients. Models performed better in younger than in older patients. Overall, model performance was better in these all-payer data than in Medicare FFS >65 data. Based on these analyses, we conclude that the HWR measure can be applied to an adult all-payer population.

2b4.4 If outcome or resource use measure is not risk adjusted, provide rationale and analyses to justify lack of adjustment: N/A

2b5. Identification of Meaningful Differences in Performance. (The performance measure scores were appropriately analyzed and discriminated meaningful differences in quality.)

2b5.1 Data/Sample (Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included):

NQF #1789 Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)

To examine differences in performance, we used the Medicare FFS 2007-2008 development dataset. The final results (unadjusted and risk-standardized hospital-level 30 day readmission rates) were calculated across 4,742 hospitals. We excluded hospitals with fewer than 25 cases total across the five condition cohorts since estimates for hospitals with fewer cases are less reliable, and CMS' past approach to public reporting has been not to report these results.

2b5.2 Analytic Method (*Describe methods and rationale to identify statistically significant and practically/meaningfully differences in performance*):

The method for discriminating hospital performance has not been determined. For six publicly reported readmission measures of hospital outcomes developed with similar methodology, CMS currently estimates an interval estimate for each risk-standardized rate to characterize the amount of uncertainty associated with the rate compares the interval estimate to the national crude rate for the outcome, and categorizes hospitals as "better than," "worse than," or "no different than" the US national rate. However, the decision to publicly report this measure and the approach to discriminating performance has not been determined.

See attachment (Technical Report, Section 2.6) for a description of the analytic method.

2b5.3 Results (*Provide measure performance results/scores, e.g., distribution by quartile, mean, median, SD, etc.; identification of statistically significant and meaningfully differences in performance*):

Table 14 shows the distribution of standardized risk ratios for each one of the five models (for each specialty cohort).

Table 14: Distribution of standardized risk ratios: Hierarchical logistic regression model results for the Medicare FFS 2007-2008 development sample

SRR//Mean//SD//Minimum//10th percentile//Lower quartile//Median//Upper quartile//90th Percentile//Maximum

SRR Combined//1.00//0.07//0.75//0.92//0.96//0.99//1.04//1.09//1.36
 SRR Medicine//1.00//0.09//0.75//0.90//0.94//0.99//1.05//1.12//1.51
 SRR Surgery/Gynecology//1.00//0.08//0.73//0.91//0.96//1.00//1.04//1.10//1.52
 SRR Cardiorespiratory//1.00//0.08//0.75//0.90//0.95//1.00//1.05//1.11//1.44
 SRR Cardiovascular//1.00//0.05//0.78//0.94//0.97//1.00//1.03//1.06//1.32
 SRR Neurology//1.00//0.06//0.76//0.94//0.97//1.00//1.03//1.07//1.34

Combined score derived from the results of the five models: The unadjusted readmission rates ranged from 0% to 36.56%, with a median of 16.26% and an interquartile range of 14.01-18.64. The mean \pm standard deviation (SD) hospital unadjusted readmission rate was 16.35% \pm 4.20. The risk-standardized rates (RSRRs) had a much narrower range, from 12.58% to 22.76%, with a median of 16.58% and an interquartile range of 15.96-17.30. The mean \pm SD hospital RSRR was 16.69% \pm 1.15%.

2b6. Comparability of Multiple Data Sources/Methods. (*If specified for more than one data source, the various approaches result in comparable scores.*)

2b6.1 Data/Sample (*Describe the data or sample including number of measured entities; number of patients; dates of data; if a sample, characteristics of the entities included*):

N/A

2b6.2 Analytic Method (*Describe methods and rationale for testing comparability of scores produced by the different data sources specified in the measure*):

N/A

2b6.3 Testing Results (*Provide statistical results, e.g., correlation statistics, comparison of rankings; assessment of adequacy in the context of norms for the test conducted*):

N/A

2c. Disparities in Care: H M L I NA (*If applicable, the measure specifications allow identification of disparities.*)

2c.1 If measure is stratified for disparities, provide stratified results (*Scores by stratified categories/cohorts*): N/A

2c.2 If disparities have been reported/identified (e.g., in 1b), but measure is not specified to detect disparities, please

explain:

To identify potential disparities related to race, we examined among all hospitals included in the HWR measure, the relationship between risk standardized readmission rates (RSRRs) and hospital proportion of African American patients. We classified hospitals into =2%, >2% to =10%, >10% to =30% and greater than 30% groups based on clinical judgment, in order to ensure adequate focus on the hospitals at greatest risk for disparities. Table 15 illustrates the mean and range of RSRRs according to the proportion of African American patients at the hospital. Median RSRR rises with increasing proportion of African American patients.

Table 15. Mean and range of RSRRs according to hospital proportion of African American patients (Medicare FFS data)

AA%//N Obs//Mean//SD//Minimum//Lower quartile//Median//Upper quartile//Maximum

- A: [0 - 2%]//2324//16.41//0.98//12.74//15.83//16.38//16.95//21.55
- B: [2 - 10%]//1315//16.74//1.14//12.58//16.01//16.64//17.37//20.97
- C: [10 - 30%]//790//17.02//1.22//13.95//16.17//16.89//17.74//21.73
- D: [30 - %]//358//17.63//1.36//14.85//16.63//17.4//18.4//22.76

Given that there is no clinical rationale for an African American patient to have different readmission risk than a white patient based on race alone, we elected not to stratify the measure by race. Hospitals should not be held to a different standard based on race.

To identify potential disparities related to socioeconomic status, we examined among all hospitals included in the HWR measure, the relationship between readmission rates (RSRRs) and hospital proportion of Medicaid discharges as defined by American Hospital Association (AHA) data. We classified hospitals into <=10%, 10 to <=20%, 20% to <=30%, and greater than 30% groups based on clinical judgment. Table 16 illustrates the mean and range of RSRRs according to the proportion of Medicaid patients at the hospital. Median RSRR rises modestly with increasing proportion of Medicaid patients. The few hospitals with more than 30% Medicaid patients have the highest median RSRR, 0.40 percentage points greater than the hospitals with fewer than 10% Medicaid patients. However, even in the group of hospitals with more than 30% Medicaid patients, more than a quarter of the group performs better than the median hospital with less than 10% Medicaid patients. Thus, there is substantial overlap, and performance is not determined by SES status.

Table 16. Mean and range of RSRRs according to hospital proportion of Medicaid patients (Medicare FFS data)

Rate Group//N Obs//Mean//SD//Minimum//Lower quartile//Median//Upper quartile//Maximum

- A: [0 - 10%]//1216//16.53//0.97//12.58//15.96//16.5//17.08//19.84
- B: (10 - 20%]//2158//16.65//1.16//12.79//15.9//16.52//17.27//21.73
- C: (20 - 30%]//897//16.84//1.24//13.7//16.01//16.74//17.56//21.35
- D: (30% -]//334//17.17//1.4//13.84//16.25//16.9//17.9//22.76

Given the modest relationship found, the substantial overlap in performance, and the fact that we cannot distinguish whether the increase in RSRR relates to unmeasured readmission risk or to true differences in quality provided by hospitals, we decided not to stratify the HWR measure based on socio-economic status.

2.1-2.3 Supplemental Testing Methodology Information:

Attachment

HWR_Technical Rpt_10.28.11_FINAL for NQF_compliant-634554121923682465.pdf

Steering Committee: Overall, was the criterion, *Scientific Acceptability of Measure Properties*, met?

(Reliability and Validity must be rated moderate or high) Yes No

Provide rationale based on specific subcriteria:

If the Committee votes No, STOP

3. USABILITY

Extent to which intended audiences (e.g., consumers, purchasers, providers, policy makers) can understand the results of the measure and are likely to find them useful for decision making. (evaluation criteria)

C.1 Intended Purpose/ Use (Check all the purposes and/or uses for which the measure is intended): [Public Reporting, Quality Improvement with Benchmarking \(external benchmarking to multiple organizations\)](#)

3.1 Current Use (Check all that apply; for any that are checked, provide the specific program information in the following questions): [Not in use](#)

3a. Usefulness for Public Reporting: H M L I
(The measure is meaningful, understandable and useful for public reporting.)

3a.1. Use in Public Reporting - disclosure of performance results to the public at large (If used in a public reporting program, provide name of program(s), locations, Web page URL(s)). If not publicly reported in a national or community program, state the reason AND plans to achieve public reporting, potential reporting programs or commitments, and timeline, e.g., within 3 years of endorsement: [**For Maintenance** – If not publicly reported, describe progress made toward achieving disclosure of performance results to the public at large and expected date for public reporting; provide rationale why continued endorsement should be considered.]

[This measure is designed for use in public reporting but is not currently in use.](#)

3a.2. Provide a rationale for why the measure performance results are meaningful, understandable, and useful for public reporting. If usefulness was demonstrated (e.g., focus group, cognitive testing), describe the data, method, and results: [Readmission following hospitalization is a costly and often preventable event. Currently, the Centers for Medicare & Medicaid Services \(CMS\) publicly reports risk-standardized readmission rates for specific conditions including heart failure, pneumonia and acute myocardial infarction. These measures underwent consumer testing prior to being publicly reported and were found to be useful for public reporting outcomes. While it is helpful to assess readmission rates for specific groups of patients, these conditions account for only a small minority of total readmissions. The hospital-wide readmission measure captures 93.1% of eligible Medicare admissions and 92.1% of readmissions following those admissions. The measure results show that 83% of hospitals have admissions in every cohort, and that c statistics for performance of each model are consistent with those of models for other publicly reported measures. In addition, comments received during the public comment period for this measure showed strong support for the organization of the measure into multiple specialty cohorts based on care team, providing actionable information for hospitals.](#)

[Since its development, the measure has been tested and specified for an adult all-payer population, further increasing the applicability of the measure in public reporting.](#)

3.2 Use for other Accountability Functions (payment, certification, accreditation). If used in a public accountability program, provide name of program(s), locations, Web page URL(s): [This measure is not currently used in a public accountability program.](#)

3b. Usefulness for Quality Improvement: H M L I
(The measure is meaningful, understandable and useful for quality improvement.)

3b.1. Use in QI. If used in quality improvement program, provide name of program(s), locations, Web page URL(s): [**For Maintenance** – If not used for QI, indicate the reasons and describe progress toward using performance results for improvement].

[This measure is currently not used in a QI program. A primary goal of the measure is to provide hospitals with information necessary to implement focused quality improvement programs.](#)

3b.2. Provide rationale for why the measure performance results are meaningful, understandable, and useful for quality improvement. If usefulness was demonstrated (e.g., QI initiative), describe the data, method and results: [By providing crucial information on hospitals' readmission rates, this measure is an essential tool to establish national benchmarks for performance, identify high- and low-performing hospitals, assess the value of multi-condition readmission reduction programs, and track trends over time. In addition, this measure provides hospitals with standardized risk ratio for five different cohorts of conditions based on service line. Organizing results by care team or service line will allow hospitals to identify areas of strength and weakness and therefore focus quality improvement initiatives on higher-risk conditions/services.](#)

Overall, to what extent was the criterion, *Usability*, met? H M L I

Provide rationale based on specific subcriteria:

4. FEASIBILITY

Extent to which the required data are readily available, retrievable without undue burden, and can be implemented for performance measurement. (evaluation criteria)

4a. Data Generated as a Byproduct of Care Processes: H M L I

4a.1-2 How are the data elements needed to compute measure scores generated? (Check all that apply).

Data used in the measure are:

Coded by someone other than person obtaining original information (e.g., DRG, ICD-9 codes on claims)

4b. Electronic Sources: H M L I

4b.1 Are the data elements needed for the measure as specified available electronically (Elements that are needed to compute measure scores are in defined, computer-readable fields): ALL data elements in electronic claims

4b.2 If ALL data elements are not from electronic sources, specify a credible, near-term path to electronic capture, OR provide a rationale for using other than electronic sources:

4c. Susceptibility to Inaccuracies, Errors, or Unintended Consequences: H M L I

4c.1 Identify susceptibility to inaccuracies, errors, or unintended consequences of the measurement identified during testing and/or operational use and strategies to prevent, minimize, or detect. If audited, provide results:

Use of claims data for risk adjustment:

Variables for risk adjustment are identified in claims data that are submitted by hospitals to payers, such as CMS, and/or states, for payment. Prior research has demonstrated that administrative claims data can be used to develop risk-adjusted outcomes measures for readmission following admission for acute myocardial infarction and heart failure and that the models produce estimates of RSRRs that are very similar to rates estimated by models based on medical record data [1,2]. This high level of agreement supports the use of the claims-based risk-adjusted models for public reporting. The models have also demonstrated consistent performance across years of claims data. The approach to gathering risk factors for patients also mitigates the potential limitations of claims data. Because not every diagnosis is coded at every visit, we identify comorbid conditions for risk adjustment in inpatient data coded in the year prior to the hospital stay, as well as those coded in the secondary diagnosis fields during the index hospital stay. This strategy allows for comprehensive identification of comorbid conditions. If a diagnosis appeared only once, in some visits and not others, it is included, minimizing the effect of incomplete coding [1].

The measure does not adjust for conditions that may represent complications of the care received during the index hospital stay. Although some codes, by definition, represent conditions that are present before the hospital stay (e.g. cancer), other codes and conditions cannot be distinguished from complications that may have occurred during the index hospital stay (e.g., infection or shock). These conditions are not included in the risk-adjusted model because that could attenuate the measure's ability to characterize the quality of care delivered by hospitals. However, if that condition is coded in the index admission and the patient has a history of that condition, it is included in the risk-adjusted model. Potential complications of care are not adjusted for if documented only during the index admission.

The measure is also aligned with the American Heart Association and the American College of Cardiology's published standards for statistical models used for calculation and public reporting of health outcome measures [3]. The National Quality Forum (NQF) endorsed the heart failure readmission measure in 2008, and the AMI and pneumonia measures in 2009 following a rigorous review process involving clinicians, providers, consumers, purchasers, and researchers. Details and technical information on the development of the 30-day readmission model are provided at QualityNet.org.

4d. Data Collection Strategy/Implementation: H M L I

A.2 Please check if either of the following apply (*regarding proprietary measures*):

4d.1 Describe what you have learned/modified as a result of testing and/or operational use of the measure regarding data collection, availability of data, missing data, timing and frequency of data collection, sampling, patient confidentiality, time and cost of data collection, other feasibility/implementation issues (*e.g., fees for use of proprietary measures*):

The measure is not in operational use.

Overall, to what extent was the criterion, *Feasibility*, met? H M L I

Provide rationale based on specific subcriteria:

OVERALL SUITABILITY FOR ENDORSEMENT

Does the measure meet all the NQF criteria for endorsement? Yes No

Rationale:

If the Committee votes No, STOP.

If the Committee votes Yes, the final recommendation is contingent on comparison to related and competing measures.

5. COMPARISON TO RELATED AND COMPETING MEASURES

If a measure meets the above criteria and there are endorsed or new related measures (either the same measure focus or the same target population) or competing measures (both the same measure focus and the same target population), the measures are compared to address harmonization and/or selection of the best measure before a final recommendation is made.

5.1 If there are related measures (*either same measure focus or target population*) or competing measures (*both the same measure focus and same target population*), list the NQF # and title of all related and/or competing measures:

0329 : Risk-Adjusted 30-Day All-Cause Readmission Rate

0330 : Hospital 30-day, all-cause, risk-standardized readmission rate following heart failure hospitalization for patients 18 and older

0505 : Hospital 30-day all-cause risk-standardized readmission rate (RSRR) following acute myocardial infarction (AMI) hospitalization.

0506 : Thirty-day all-cause risk standardized readmission rate following pneumonia hospitalization.

0695 : Hospital 30-Day Risk-Standardized Readmission Rates following Percutaneous Coronary Intervention (PCI)

5a. Harmonization

5a.1 If this measure has EITHER the same measure focus OR the same target population as NQF-endorsed measure(s):

Are the measure specifications completely harmonized? No

5a.2 If the measure specifications are not completely harmonized, identify the differences, rationale, and impact on interpretability and data collection burden:

The Hospital-Wide All-Cause Unplanned Readmission Measure differs from the other hospital-wide measure previously endorsed by NQF in the types of admissions eligible for inclusion, the types of readmission counted as outcomes, and the risk-adjustment strategies. Therefore, it is very likely that the range of outlier hospitals identified by these measures will vary significantly. Measure Cohort Inclusions: PacifiCare: Patients 18 years and older for both Commercial and Medicare populations. HWR: Patients 65 years and older for FFS Medicare population (until pending tests in all-payer data are completed). Measure Cohort Exclusions: PacifiCare: maternity discharges; patients discharged deceased; patients without a valid identifier, discharge date or DRG weight. PacifiCare requires a minimum of 50 cases per hospital. HWR: patients discharged deceased; transferred; not continuously enrolled in FFS Medicare for the 12 months prior to the index admission; discharged AMA; admissions for "rehabilitation care, fitting of prostheses and adjustment devices" (CCS 254); admissions to PPS-exempt cancer hospitals and admissions for medical active cancer treatment and psychiatric disease. See attachment (Technical Report, Section 2.3.2, Table 3 and 4) for a list of cancer and

NQF #1789 Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)

psychiatric discharge condition categories excluded. Our guiding principle for defining the eligible population was that the measure should capture as many unplanned readmissions as possible across a maximum number of acute care hospitals, while including only admissions for which readmission can be considered a signal of quality of care. Our analysis of patients undergoing cancer treatment found that this cohort had substantial competing risk of mortality in the post-discharge period, undermining the value of readmission as a quality indicator. Furthermore, this cohort's standardized readmission ratio (SRR) was very poorly correlated with the composite hospital-wide SRR, especially compared to other cohorts. The internal consistency of the measure improved substantially when the cancer treatment cohort was removed. It is important to note that patients with secondary diagnoses of cancer admitted for other reasons are still included in this measure based on discharge diagnosis condition or procedure. Patients admitted for treatment of psychiatric disease are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals. After all these exclusions, HWR measure still captures 92.1% of readmissions and 93.1% of admissions. Outcome Definition: PacifiCare: Readmission for any diagnosis within 30 days of discharge except readmissions to another acute care facility within a day of discharge and readmissions related to delivery of a newborn. HWR: Unplanned all-cause 30-day readmission after an admission for any eligible condition. Because planned readmissions are not a signal of quality of care, they are excluded from the outcome. Because of absence of a specific flag on administrative claims, an algorithm was developed for identifying "planned readmissions" in claims data (see Section 2a1.3 for the details of the algorithm). In 2008, there were 127,785 planned readmissions in the starting final cohort, accounting for 9% of all readmissions. Risk-adjustment strategy: Our most important difference with the competing measure is in the risk-adjustment methodology. PacifiCare: The only covariate or risk variable in their model is the Diagnosis Related Group (DRG) weight and they use only information from the index admission. DRG's are affected by complications of care; therefore, the measure adjusts away increased readmission risk associated with care complications. HWR: This measure uses a fixed, common set of 31 comorbid risk adjustment variables based on data from the index admission and any comorbidity occurring in the 365 days prior to the index discharge date, obtained from inpatient claims. We do not adjust for comorbidities occurring during the index admission that can be complications of care during hospitalization. See Section 2a1.13 for risk variable selection process and list of 31 risk variables. Finally, for all condition categories with sufficient volume (defined as those with more than 1,000 admissions nationally each year), we included a condition-specific risk variable in the model. In addition to adjusting for comorbidity and for discharge condition, this measure includes five distinct risk-adjustment models. Rather than assume that effect of risk factors would be homogeneous across all discharge condition categories, we constructed five separate models for groups of clinically-similar admissions. The multiple models approach showed better discrimination and predictive ability for readmission risk. In addition, dividing the measure into several models based on service line/clinical conditions better captures variation across hospitals in the mix of conditions and procedures, and provides actionable information to hospitals.

5b. Competing Measure(s)

5b.1 If this measure has both the same measure focus and the same target population as NQF-endorsed measure(s): Describe why this measure is superior to competing measures (e.g., a more valid or efficient way to measure quality); OR provide a rationale for the additive value of endorsing an additional measure. (Provide analyses when possible):

As noted in 5.1, there is one NQF-endorsed competing measure for all-condition readmission, the PacifiCare measure by United Health Company. The HWR measure differs in several key respects from PacifiCare, as described in 5a.2. These differences improve the validity of the HWR measure relative to PacifiCare in the following ways:

- 1) HWR does not count planned readmissions, which are not a quality signal, in the outcome; PacifiCare does
- 2) HWR accounts for the clustering of patients within hospitals, making the risk-standardized rate statistically more robust; PacifiCare does not
- 3) HWR includes a full year of risk-adjustment data to improve capture of comorbidities; PacifiCare includes data only from the index admission
- 4) PacifiCare uses DRGs for risk adjustment, which adjusts away potential complications of care that occur during the hospitalization rather than holding hospitals accountable for those complications.

'Q93 '	'217'	Other congenital anomalies	Monosomies and deletions from the autosomes, not elsewhere classified
'Q93.0 '	'217'	Other congenital anomalies	Whole chromosome monosomy, nonmosaicism (meiotic nondisjunction)
'Q93.1 '	'217'	Other congenital anomalies	Whole chromosome monosomy, mosaicism (mitotic nondisjunction)
'Q93.2 '	'217'	Other congenital anomalies	Chromosome replaced with ring, dicentric or isochromosome
'Q93.3 '	'217'	Other congenital anomalies	Deletion of short arm of chromosome 4
'Q93.4 '	'217'	Other congenital anomalies	Deletion of short arm of chromosome 5

'Q93.5 '	'217'	Other congenital anomalies	Other deletions of part of a chromosome
'Q93.6 '	'217'	Other congenital anomalies	Deletions seen only at prometaphase
'Q93.7 '	'217'	Other congenital anomalies	Deletions with other complex rearrangements
'Q93.8 '	'217'	Other congenital anomalies	Other deletions from the autosomes
'Q93.9 '	'217'	Other congenital anomalies	Deletion from autosomes, unspecified
'Q95 '	'217'	Other congenital anomalies	Balanced rearrangements and structural markers, not elsewhere classified
'Q95.0 '	'217'	Other congenital anomalies	Balanced translocation and insertion in normal individual
'Q95.1 '	'217'	Other congenital anomalies	Chromosome inversion in normal individual
'Q95.2 '	'217'	Other congenital anomalies	Balanced autosomal rearrangement in abnormal individual
'Q95.3 '	'217'	Other congenital anomalies	Balanced sex/autosomal rearrangement in abnormal individual
'Q95.4 '	'217'	Other congenital anomalies	Individuals with marker heterochromatin
'Q95.5 '	'217'	Other congenital anomalies	Individual with autosomal fragile site
'Q95.8 '	'217'	Other congenital anomalies	Other balanced rearrangements and structural markers
'Q95.9 '	'217'	Other congenital anomalies	Balanced rearrangement and structural marker, unspecified
'Q96 '	'217'	Other congenital anomalies	'Turner's syndrome '
'Q96.0 '	'217'	Other congenital anomalies	Karyotype 45, X
'Q96.1 '	'217'	Other congenital anomalies	Karyotype 46, X iso (Xq)
'Q96.2 '	'217'	Other congenital anomalies	Karyotype 46, X with abnormal sex chromosome, except iso (Xq)
'Q96.3 '	'217'	Other congenital anomalies	Mosaicism, 45, X/46, XX or XY
'Q96.4 '	'217'	Other congenital anomalies	Mosaicism, 45, X/other cell line(s) with abnormal sex chromosome
'Q96.8 '	'217'	Other congenital anomalies	Other variants of Turner's syndrome
'Q96.9 '	'217'	Other congenital anomalies	Turner's syndrome, unspecified
'Q97 '	'217'	Other congenital anomalies	Other sex chromosome abnormalities, female phenotype, not elsewhere
'Q97.0 '	'217'	Other congenital anomalies	Karyotype 47, XXX
'Q97.1 '	'217'	Other congenital anomalies	Female with more than three X chromosomes
'Q97.2 '	'217'	Other congenital anomalies	Mosaicism, lines with various numbers of X chromosomes
'Q97.3 '	'217'	Other congenital anomalies	Female with 46, XY karyotype
'Q97.8 '	'217'	Other congenital anomalies	Other specified sex chromosome abnormalities, female phenotype
'Q97.9 '	'217'	Other congenital anomalies	Sex chromosome abnormality, female phenotype, unspecified
'Q98 '	'217'	Other congenital anomalies	Other sex chromosome abnormalities, male phenotype, not elsewhere
'Q98.0 '	'217'	Other congenital anomalies	Klinefelter syndrome karyotype 47, XXY
'Q98.1 '	'217'	Other congenital anomalies	Klinefelter syndrome, male with more than two X chromosomes
'Q98.2 '	'217'	Other congenital anomalies	Klinefelter's syndrome, male with 46,XX karyotype
'Q98.3 '	'217'	Other congenital anomalies	Other male with 46, XX karyotype

'Q98.4 '	'217'	Other congenital anomalies	Klinefelter syndrome, unspecified
'Q98.5 '	'217'	Other congenital anomalies	Karyotype 47, XYY
'Q98.6 '	'217'	Other congenital anomalies	Male with structurally abnormal sex chromosome
'Q98.7 '	'217'	Other congenital anomalies	Male with sex chromosome mosaicism
'Q98.8 '	'217'	Other congenital anomalies	Other specified sex chromosome abnormalities, male phenotype
'Q98.9 '	'217'	Other congenital anomalies	Sex chromosome abnormality, male phenotype, unspecified
'Q99 '	'217'	Other congenital anomalies	Other chromosome abnormalities, not elsewhere classified
'Q99.0 '	'217'	Other congenital anomalies	Chimera 46, XX/46, XY
'Q99.1 '	'217'	Other congenital anomalies	46, XX true hermaphrodite
'Q99.2 '	'217'	Other congenital anomalies	Fragile X chromosome
'Q99.8 '	'217'	Other congenital anomalies	Other specified chromosome abnormalities
'Q99.9 '	'217'	Other congenital anomalies	Chromosomal abnormality, unspecified
'R29.4 '	'217'	Other congenital anomalies	Clicking hip
'P05 '	'219'	Short gestation; low birth weight; and fetal	Slow fetal growth and fetal malnutrition
'P05.0 '	'219'	Short gestation; low birth weight; and fetal	Light for gestational age
'P05.1 '	'219'	Short gestation; low birth weight; and fetal	Small for gestational age
'P05.2 '	'219'	Short gestation; low birth weight; and fetal	Newborn affected by fetal (intrauterine) malnutrition not light or small for
'P05.9 '	'219'	Short gestation; low birth weight; and fetal	Newborn affected by slow intrauterine growth, unspecified
'P07 '	'219'	Short gestation; low birth weight; and fetal	Disorders related to short gestation and low birth weight, not elsewhere
'P07.0 '	'219'	Short gestation; low birth weight; and fetal	Extremely low birth weight
'P07.1 '	'219'	Short gestation; low birth weight; and fetal	Other low birth weight
'P07.2 '	'219'	Short gestation; low birth weight; and fetal	Extreme immaturity
'P07.3 '	'219'	Short gestation; low birth weight; and fetal	Other preterm infants
'P20.0 '	'220'	Intrauterine hypoxia and birth asphyxia	Intrauterine hypoxia first noted before onset of labour
'P20.1 '	'220'	Intrauterine hypoxia and birth asphyxia	Intrauterine hypoxia first noted during labour and delivery
'P20.9 '	'220'	Intrauterine hypoxia and birth asphyxia	Intrauterine hypoxia, unspecified
'P21 '	'220'	Intrauterine hypoxia and birth asphyxia	Birth asphyxia
'P21.0 '	'220'	Intrauterine hypoxia and birth asphyxia	Severe birth asphyxia
'P21.1 '	'220'	Intrauterine hypoxia and birth asphyxia	Mild and moderate birth asphyxia
'P21.9 '	'220'	Intrauterine hypoxia and birth asphyxia	Birth asphyxia, unspecified

'T38.9 '	'242'	Poisoning by other medications and drugs	Other and unspecified hormone antagonists
'T39 '	'242'	Poisoning by other medications and drugs	Poisoning by nonopioid analgesics, antipyretics and antirheumatics
'T39.0 '	'242'	Poisoning by other medications and drugs	Salicylates
'T39.1 '	'242'	Poisoning by other medications and drugs	4-Aminophenol derivatives
'T39.2 '	'242'	Poisoning by other medications and drugs	Pyrazolone derivatives
'T39.3 '	'242'	Poisoning by other medications and drugs	Other nonsteroidal anti-inflammatory drugs [NSAID]
'T39.4 '	'242'	Poisoning by other medications and drugs	Antirheumatics, not elsewhere classified
'T39.8 '	'242'	Poisoning by other medications and drugs	Other nonopioid analgesics and antipyretics, not elsewhere classified
'T39.9 '	'242'	Poisoning by other medications and drugs	Nonopioid analgesic, antipyretic and antirheumatic, unspecified
'T41 '	'242'	Poisoning by other medications and drugs	Poisoning by anaesthetics and therapeutic gases
'T41.0 '	'242'	Poisoning by other medications and drugs	Inhaled anaesthetics

'T41.1 '	'242'	Poisoning by other medications and drugs	Intravenous anaesthetics
'T41.2 '	'242'	Poisoning by other medications and drugs	Other and unspecified general anaesthetics
'T41.3 '	'242'	Poisoning by other medications and drugs	Local anaesthetics
'T41.4 '	'242'	Poisoning by other medications and drugs	Anaesthetic, unspecified
'T41.5 '	'242'	Poisoning by other medications and drugs	Therapeutic gases
'T42.8 '	'242'	Poisoning by other medications and drugs	Antiparkinsonism drugs and other central muscle-tone depressants
'T44 '	'242'	Poisoning by other medications and drugs	Poisoning by drugs primarily affecting the autonomic nervous system
'T44.0 '	'242'	Poisoning by other medications and drugs	Anticholinesterase agents
'T44.1 '	'242'	Poisoning by other medications and drugs	Other parasympathomimetics [cholinergics]
'T44.2 '	'242'	Poisoning by other medications and drugs	Ganglionic blocking drugs, not elsewhere classified
'T44.3 '	'242'	Poisoning by other medications and drugs	Other parasympatholytics [anticholinergics and antimuscarinics] and spasmolytics, not elsewhere clas
'T44.4 '	'242'	Poisoning by other medications and drugs	Predominantly alpha-adrenoreceptor agonists, not elsewhere classified
'T44.5 '	'242'	Poisoning by other medications and drugs	Predominantly beta-adrenoreceptor agonists, not elsewhere classified
'T44.6 '	'242'	Poisoning by other medications and drugs	Alpha-Adrenoreceptor antagonists, not elsewhere classified
'T44.7 '	'242'	Poisoning by other medications and drugs	Beta-Adrenoreceptor antagonists, not elsewhere classified
'T44.8 '	'242'	Poisoning by other medications and drugs	Centrally acting and adrenergic-neuron-blocking agents, not elsewhere
'T44.9 '	'242'	Poisoning by other medications and drugs	Other and unspecified drugs primarily affecting the autonomic nervous system
'T45 '	'242'	Poisoning by other medications and drugs	Poisoning by primarily systemic and haematological agents, not elsewhere
'T45.0 '	'242'	Poisoning by other medications and drugs	Antiallergic and antiemetic drugs
'T45.1 '	'242'	Poisoning by other medications and drugs	Antineoplastic and immunosuppressive drugs
'T45.2 '	'242'	Poisoning by other medications and drugs	Vitamins, not elsewhere classified
'T45.3 '	'242'	Poisoning by other medications and drugs	Enzymes, not elsewhere classified
'T45.4 '	'242'	Poisoning by other medications and drugs	Iron and its compounds
'T45.5 '	'242'	Poisoning by other medications and drugs	Anticoagulants
'T45.6 '	'242'	Poisoning by other medications and drugs	Fibrinolysis-affecting drugs
'T45.7 '	'242'	Poisoning by other medications and drugs	Anticoagulant antagonists, vitamin K and other coagulants
'T45.8 '	'242'	Poisoning by other medications and drugs	Other primarily systemic and haematological agents
'T45.9 '	'242'	Poisoning by other medications and drugs	Primarily systemic and haematological agent, unspecified
'T46 '	'242'	Poisoning by other medications and drugs	Poisoning by agents primarily affecting the cardiovascular system
'T46.0 '	'242'	Poisoning by other medications and drugs	Cardiac-stimulant glycosides and drugs of similar action
'T46.1 '	'242'	Poisoning by other medications and drugs	Calcium-channel blockers
'T46.2 '	'242'	Poisoning by other medications and drugs	Other antidysrhythmic drugs, not elsewhere classified
'T46.3 '	'242'	Poisoning by other medications and drugs	Coronary vasodilators, not elsewhere classified

'T46.4 '	'242'	Poisoning by other medications and drugs	Angiotensin-converting-enzyme inhibitors
'T46.5 '	'242'	Poisoning by other medications and drugs	Other antihypertensive drugs, not elsewhere classified
'T46.6 '	'242'	Poisoning by other medications and drugs	Antihyperlipidaemic and antiarteriosclerotic drugs
'T46.7 '	'242'	Poisoning by other medications and drugs	Peripheral vasodilators
'T46.8 '	'242'	Poisoning by other medications and drugs	Antivaricose drugs, including sclerosing agents
'T46.9 '	'242'	Poisoning by other medications and drugs	Other and unspecified agents primarily affecting the cardiovascular system
'T47 '	'242'	Poisoning by other medications and drugs	Poisoning by agents primarily affecting the gastrointestinal system
'T47.0 '	'242'	Poisoning by other medications and drugs	Histamine H2-receptor antagonists
'T47.1 '	'242'	Poisoning by other medications and drugs	Other antacids and anti-gastric-secretion drugs
'T47.2 '	'242'	Poisoning by other medications and drugs	Stimulant laxatives
'T47.3 '	'242'	Poisoning by other medications and drugs	Saline and osmotic laxatives
'T47.4 '	'242'	Poisoning by other medications and drugs	Other laxatives
'T47.5 '	'242'	Poisoning by other medications and drugs	Digestants
'T47.6 '	'242'	Poisoning by other medications and drugs	Antidiarrhoeal drugs
'T47.7 '	'242'	Poisoning by other medications and drugs	Emetics
'T47.8 '	'242'	Poisoning by other medications and drugs	Other agents primarily affecting the gastrointestinal system
'T47.9 '	'242'	Poisoning by other medications and drugs	Agent primarily affecting the gastrointestinal system, unspecified
'T48 '	'242'	Poisoning by other medications and drugs	Poisoning by agents primarily acting on smooth and skeletal muscles and the
'T48.0 '	'242'	Poisoning by other medications and drugs	Oxytocic drugs
'T48.1 '	'242'	Poisoning by other medications and drugs	Skeletal muscle relaxants [neuromuscular blocking agents]
'T48.2 '	'242'	Poisoning by other medications and drugs	Other and unspecified agents primarily acting on muscles
'T48.3 '	'242'	Poisoning by other medications and drugs	Antitussives
'T48.4 '	'242'	Poisoning by other medications and drugs	Expectorants
'T48.5 '	'242'	Poisoning by other medications and drugs	Anti-common-cold drugs
'T48.6 '	'242'	Poisoning by other medications and drugs	Antiasthmatics, not elsewhere classified
'T48.7 '	'242'	Poisoning by other medications and drugs	Other and unspecified agents primarily acting on the respiratory system
'T49 '	'242'	Poisoning by other medications and drugs	Poisoning by topical agents primarily affecting skin and mucous membrane and by ophthalmological, ot
'T49.0 '	'242'	Poisoning by other medications and drugs	Local antifungal, anti-infective and anti-inflammatory drugs, not elsewhere
'T49.1 '	'242'	Poisoning by other medications and drugs	Antipruritics
'T49.2 '	'242'	Poisoning by other medications and drugs	Local astringents and local detergents
'T49.3 '	'242'	Poisoning by other medications and drugs	Emollients, demulcents and protectants
'T49.4 '	'242'	Poisoning by other medications and drugs	Keratolytics, keratoplastics and other hair treatment drugs and preparations
'T49.5 '	'242'	Poisoning by other medications and drugs	Ophthalmological drugs and preparations

'T49.6 '	'242'	Poisoning by other medications and drugs	Otorhinolaryngological drugs and preparations
'T49.7 '	'242'	Poisoning by other medications and drugs	Dental drugs, topically applied
'T49.8 '	'242'	Poisoning by other medications and drugs	Other topical agents
'T49.9 '	'242'	Poisoning by other medications and drugs	Topical agent, unspecified
'T50 '	'242'	Poisoning by other medications and drugs	Poisoning by diuretics and other and unspecified drugs, medicaments and
'T50.0 '	'242'	Poisoning by other medications and drugs	Mineralocorticoids and their antagonists
'T50.1 '	'242'	Poisoning by other medications and drugs	Loop [high-ceiling] diuretics
'T50.2 '	'242'	Poisoning by other medications and drugs	Carbonic-anhydrase inhibitors, benzothiadiazides and other diuretics
'T50.3 '	'242'	Poisoning by other medications and drugs	Electrolytic, caloric and water-balance agents
'T50.4 '	'242'	Poisoning by other medications and drugs	Drugs affecting uric acid metabolism
'T50.5 '	'242'	Poisoning by other medications and drugs	Appetite depressants
'T50.6 '	'242'	Poisoning by other medications and drugs	Antidotes and chelating agents, not elsewhere classified
'T50.7 '	'242'	Poisoning by other medications and drugs	Analeptics and opioid receptor antagonists
'T50.8 '	'242'	Poisoning by other medications and drugs	Diagnostic agents
'T50.9 '	'242'	Poisoning by other medications and drugs	Other and unspecified drugs, medicaments and biological substances
'T96 '	'242'	Poisoning by other medications and drugs	Sequelae of poisoning by drugs, medicaments and biological substances
'T51 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of alcohol
'T51.0 '	'243'	Poisoning by nonmedicinal substances	Ethanol
'T51.1 '	'243'	Poisoning by nonmedicinal substances	Methanol
'T51.2 '	'243'	Poisoning by nonmedicinal substances	2-Propanol
'T51.3 '	'243'	Poisoning by nonmedicinal substances	Fusel oil
'T51.8 '	'243'	Poisoning by nonmedicinal substances	Other alcohols
'T51.9 '	'243'	Poisoning by nonmedicinal substances	Alcohol, unspecified
'T52 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of organic solvents
'T52.0 '	'243'	Poisoning by nonmedicinal substances	Petroleum products
'T52.1 '	'243'	Poisoning by nonmedicinal substances	Benzene
'T52.2 '	'243'	Poisoning by nonmedicinal substances	Homologues of benzene
'T52.3 '	'243'	Poisoning by nonmedicinal substances	Glycols
'T52.4 '	'243'	Poisoning by nonmedicinal substances	Ketones
'T52.8 '	'243'	Poisoning by nonmedicinal substances	Other organic solvents
'T52.9 '	'243'	Poisoning by nonmedicinal substances	Organic solvent, unspecified
'T53 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of halogen derivatives of aliphatic and aromatic hydrocarbons
'T53.0 '	'243'	Poisoning by nonmedicinal substances	Carbon tetrachloride
'T53.1 '	'243'	Poisoning by nonmedicinal substances	Chloroform

'T53.2 '	'243'	Poisoning by nonmedicinal substances	Trichloroethylene
'T53.3 '	'243'	Poisoning by nonmedicinal substances	Tetrachloroethylene
'T53.4 '	'243'	Poisoning by nonmedicinal substances	Dichloromethane
'T53.5 '	'243'	Poisoning by nonmedicinal substances	Chlorofluorocarbons
'T53.6 '	'243'	Poisoning by nonmedicinal substances	Other halogen derivatives of aliphatic hydrocarbons
'T53.7 '	'243'	Poisoning by nonmedicinal substances	Other halogen derivatives of aromatic hydrocarbons
'T53.9 '	'243'	Poisoning by nonmedicinal substances	Halogen derivative of aliphatic and aromatic hydrocarbons, unspecified
'T54 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of corrosive substances
'T54.0 '	'243'	Poisoning by nonmedicinal substances	Phenol and phenol homologues
'T54.1 '	'243'	Poisoning by nonmedicinal substances	Other corrosive organic compounds
'T54.2 '	'243'	Poisoning by nonmedicinal substances	Corrosive acids and acid-like substances
'T54.3 '	'243'	Poisoning by nonmedicinal substances	Corrosive alkalis and alkali-like substances
'T54.9 '	'243'	Poisoning by nonmedicinal substances	Corrosive substance, unspecified
'T55 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of soaps and detergents
'T56 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of metals
'T56.0 '	'243'	Poisoning by nonmedicinal substances	Lead and its compounds
'T56.1 '	'243'	Poisoning by nonmedicinal substances	Mercury and its compounds
'T56.2 '	'243'	Poisoning by nonmedicinal substances	Chromium and its compounds
'T56.3 '	'243'	Poisoning by nonmedicinal substances	Cadmium and its compounds
'T56.4 '	'243'	Poisoning by nonmedicinal substances	Copper and its compounds
'T56.5 '	'243'	Poisoning by nonmedicinal substances	Zinc and its compounds
'T56.6 '	'243'	Poisoning by nonmedicinal substances	Tin and its compounds
'T56.7 '	'243'	Poisoning by nonmedicinal substances	Beryllium and its compounds
'T56.8 '	'243'	Poisoning by nonmedicinal substances	Other metals
'T56.9 '	'243'	Poisoning by nonmedicinal substances	Metal, unspecified
'T57 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other inorganic substances
'T57.0 '	'243'	Poisoning by nonmedicinal substances	Arsenic and its compounds
'T57.1 '	'243'	Poisoning by nonmedicinal substances	Phosphorus and its compounds
'T57.2 '	'243'	Poisoning by nonmedicinal substances	Manganese and its compounds
'T57.3 '	'243'	Poisoning by nonmedicinal substances	Hydrogen cyanide
'T57.8 '	'243'	Poisoning by nonmedicinal substances	Other specified inorganic substances
'T57.9 '	'243'	Poisoning by nonmedicinal substances	Inorganic substance, unspecified
'T58 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of carbon monoxide
'T59 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other gases, fumes and vapours

'T59.0 '	'243'	Poisoning by nonmedicinal substances	Nitrogen oxides
'T59.1 '	'243'	Poisoning by nonmedicinal substances	Sulfur dioxide
'T59.2 '	'243'	Poisoning by nonmedicinal substances	Formaldehyde
'T59.3 '	'243'	Poisoning by nonmedicinal substances	Lacrimogenic gas
'T59.4 '	'243'	Poisoning by nonmedicinal substances	Chlorine gas
'T59.5 '	'243'	Poisoning by nonmedicinal substances	Fluorine gas and hydrogen fluoride
'T59.6 '	'243'	Poisoning by nonmedicinal substances	Hydrogen sulfide
'T59.7 '	'243'	Poisoning by nonmedicinal substances	Carbon dioxide
'T59.8 '	'243'	Poisoning by nonmedicinal substances	Other specified gases, fumes and vapours
'T59.9 '	'243'	Poisoning by nonmedicinal substances	Gases, fumes and vapours, unspecified
'T60 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of pesticides
'T60.0 '	'243'	Poisoning by nonmedicinal substances	Organophosphate and carbamate insecticides
'T60.1 '	'243'	Poisoning by nonmedicinal substances	Halogenated insecticides
'T60.2 '	'243'	Poisoning by nonmedicinal substances	Other insecticides
'T60.3 '	'243'	Poisoning by nonmedicinal substances	Herbicides and fungicides
'T60.4 '	'243'	Poisoning by nonmedicinal substances	Rodenticides
'T60.8 '	'243'	Poisoning by nonmedicinal substances	Other pesticides
'T60.9 '	'243'	Poisoning by nonmedicinal substances	Pesticide, unspecified
'T61 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of noxious substances eaten as seafood
'T61.0 '	'243'	Poisoning by nonmedicinal substances	Ciguatera fish poisoning
'T61.1 '	'243'	Poisoning by nonmedicinal substances	Scombroid fish poisoning
'T61.2 '	'243'	Poisoning by nonmedicinal substances	Other fish and shellfish poisoning
'T61.8 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other seafoods
'T61.9 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of unspecified seafood
'T62 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other noxious substances eaten as food
'T62.0 '	'243'	Poisoning by nonmedicinal substances	Ingested mushrooms
'T62.1 '	'243'	Poisoning by nonmedicinal substances	Ingested berries
'T62.2 '	'243'	Poisoning by nonmedicinal substances	Other ingested (parts of) plant(s)
'T62.8 '	'243'	Poisoning by nonmedicinal substances	Other specified noxious substances eaten as food
'T62.9 '	'243'	Poisoning by nonmedicinal substances	Noxious substance eaten as food, unspecified
'T63 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of contact with venomous animals
'T63.0 '	'243'	Poisoning by nonmedicinal substances	Snake venom
'T63.1 '	'243'	Poisoning by nonmedicinal substances	Venom of other reptiles
'T63.2 '	'243'	Poisoning by nonmedicinal substances	Venom of scorpion

'T63.3 '	'243'	Poisoning by nonmedicinal substances	Venom of spider
'T63.4 '	'243'	Poisoning by nonmedicinal substances	Venom of other arthropods
'T63.5 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of contact with fish
'T63.6 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of contact with other marine animals
'T63.8 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of contact with other venomous animals
'T63.9 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of contact with unspecified venomous animal
'T64 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of aflatoxin and other mycotoxin food contaminants
'T65 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other and unspecified substances
'T65.0 '	'243'	Poisoning by nonmedicinal substances	Cyanides
'T65.1 '	'243'	Poisoning by nonmedicinal substances	Strychnine and its salts
'T65.2 '	'243'	Poisoning by nonmedicinal substances	Tobacco and nicotine
'T65.3 '	'243'	Poisoning by nonmedicinal substances	Nitroderivatives and aminoderivatives of benzene and its homologues
'T65.4 '	'243'	Poisoning by nonmedicinal substances	Carbon disulfide
'T65.5 '	'243'	Poisoning by nonmedicinal substances	Nitroglycerin and other nitric acids and esters
'T65.6 '	'243'	Poisoning by nonmedicinal substances	Paints and dyes, not elsewhere classified
'T65.8 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of other specified substances
'T65.9 '	'243'	Poisoning by nonmedicinal substances	Toxic effect of unspecified substance

'Z43.4 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to other artificial openings of digestive tract
'Z43.5 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to cystostomy
'Z43.6 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to other artificial openings of urinary tract
'Z43.7 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to artificial vagina
'Z43.8 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to other artificial openings
'Z43.9 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for attention to unspecified artificial opening
'Z44 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of external prosthetic device
'Z44.0 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of artificial arm (complete)(partial)
'Z44.1 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of artificial leg (complete)(partial)
'Z44.2 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of artificial eye
'Z44.3 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of external breast prosthesis
'Z44.8 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of other external prosthetic devices
'Z44.9 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of unspecified external prosthetic device
'Z45 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Adjustment and management of implanted device
'Z45.0 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Adjustment and management of cardiac device
'Z45.1 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for adjustment and management of infusion pump

'Z45.2 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for adjustment and management of vascular access device
'Z45.3 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Adjustment and management of implanted hearing device
'Z45.8 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Adjustment and management of other implanted devices
'Z45.9 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for adjustment and management of unspecified implanted device
'Z46 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of other devices
'Z46.0 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of spectacles and contact lenses
'Z46.1 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of hearing aid
'Z46.2 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of other devices related to nervous system and special senses
'Z46.3 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of dental prosthetic device
'Z46.4 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of orthodontic device
'Z46.5 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of ileostomy and other intestinal appliances
'Z46.6 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of urinary device
'Z46.7 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of orthopaedic device
'Z46.8 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Fitting and adjustment of other specified devices
'Z46.9 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Encounter for fitting and adjustment of unspecified device
'Z50 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Care involving use of rehabilitation procedures
'Z50.0 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Cardiac rehabilitation

'Z50.1 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Other physical therapy
'Z50.2 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Alcohol rehabilitation
'Z50.3 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Drug rehabilitation
'Z50.4 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Psychotherapy, not elsewhere classified
'Z50.5 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Speech therapy
'Z50.6 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Orthoptic training
'Z50.7 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Occupational therapy and vocational rehabilitation, not elsewhere classified
'Z50.8 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Care involving use of other rehabilitation procedures
'Z50.9 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Care involving use of rehabilitation procedure, unspecified
'Z51 '	'254'	Rehabilitation care; fitting of prostheses; and adjustment of devices	Other medical care
'Z02 '	'255'	Administrative/social admission	Examination and encounter for administrative purposes
'Z02.0 '	'255'	Administrative/social admission	Encounter for examination for admission to educational institution
'Z02.1 '	'255'	Administrative/social admission	Encounter for pre-employment examination
'Z02.2 '	'255'	Administrative/social admission	Encounter for examination for admission to residential institution
'Z02.3 '	'255'	Administrative/social admission	Encounter for examination for recruitment to armed forces
'Z02.4 '	'255'	Administrative/social admission	Encounter for examination for driving license
'Z02.5 '	'255'	Administrative/social admission	Encounter for examination for participation in sport
'Z02.6 '	'255'	Administrative/social admission	Encounter for examination for insurance purposes
'Z02.7 '	'255'	Administrative/social admission	Issue of medical certificate
'Z02.8 '	'255'	Administrative/social admission	Other examinations for administrative purposes
'Z02.9 '	'255'	Administrative/social admission	Encounter for administrative examinations, unspecified
'Z00 '	'256'	Medical examination/evaluation	General examination and investigation of persons without complaint and
'Z00.0 '	'256'	Medical examination/evaluation	General medical examination
'Z00.1 '	'256'	Medical examination/evaluation	Routine child health examination

'Z00.2 '	'256'	Medical examination/evaluation	Encounter for examination for period of rapid growth in childhood
'Z00.3 '	'256'	Medical examination/evaluation	Encounter for examination for adolescent development state
'Z00.4 '	'256'	Medical examination/evaluation	General psychiatric examination, not elsewhere classified
'Z00.5 '	'256'	Medical examination/evaluation	Encounter for examination of potential donor of organ and tissue
'Z00.6 '	'256'	Medical examination/evaluation	Encounter for examination for normal comparison and control in clinical
'Z00.8 '	'256'	Medical examination/evaluation	Encounter for other general examination
'Z01 '	'256'	Medical examination/evaluation	Other special examinations and investigations of persons without complaint or reported diagnosis
'Z01.0 '	'256'	Medical examination/evaluation	Examination of eyes and vision
'Z01.1 '	'256'	Medical examination/evaluation	Examination of ears and hearing
'Z01.2 '	'256'	Medical examination/evaluation	Dental examination
'Z01.3 '	'256'	Medical examination/evaluation	Examination of blood pressure
'Z01.4 '	'256'	Medical examination/evaluation	Gynaecological examination (general)(routine)
'Z01.5 '	'256'	Medical examination/evaluation	Diagnostic skin and sensitisation tests
'Z01.6 '	'256'	Medical examination/evaluation	Radiological examination, not elsewhere classified
'Z01.7 '	'256'	Medical examination/evaluation	Laboratory examination
'Z01.8 '	'256'	Medical examination/evaluation	Other specified special examinations
'Z01.9 '	'256'	Medical examination/evaluation	Special examination, unspecified
'Z04 '	'256'	Medical examination/evaluation	Examination and observation for other reasons
'Z04.0 '	'256'	Medical examination/evaluation	Blood-alcohol and blood-drug test
'Z04.1 '	'256'	Medical examination/evaluation	Encounter for examination and observation following transport accident
'Z04.2 '	'256'	Medical examination/evaluation	Encounter for examination and observation following work accident
'Z04.3 '	'256'	Medical examination/evaluation	Encounter for examination and observation following other accident
'Z04.4 '	'256'	Medical examination/evaluation	Examination and observation following alleged rape and seduction
'Z04.5 '	'256'	Medical examination/evaluation	Examination and observation following other inflicted injury
'Z04.6 '	'256'	Medical examination/evaluation	Encounter for general psychiatric examination, requested by authority
'Z04.8 '	'256'	Medical examination/evaluation	Encounter for examination and observation for other specified reasons
'Z04.9 '	'256'	Medical examination/evaluation	Encounter for examination and observation for unspecified reason
'Z10 '	'256'	Medical examination/evaluation	Routine general health check-up of defined subpopulation
'Z10.0 '	'256'	Medical examination/evaluation	Occupational health examination
'Z10.1 '	'256'	Medical examination/evaluation	Routine general health check-up of inhabitants of institutions
'Z10.2 '	'256'	Medical examination/evaluation	Routine general health check-up of armed forces
'Z10.3 '	'256'	Medical examination/evaluation	Routine general health check-up of sports teams
'Z10.8 '	'256'	Medical examination/evaluation	Routine general health check-up of other defined subpopulations

'Z08 '	'257'	Other aftercare	Encounter for follow-up examination after completed treatment for malignant
'Z08.0 '	'257'	Other aftercare	Follow-up examination after surgery for malignant neoplasm
'Z08.1 '	'257'	Other aftercare	Follow-up examination after radiotherapy for malignant neoplasm
'Z08.2 '	'257'	Other aftercare	Follow-up examination after chemotherapy for malignant neoplasm
'Z08.7 '	'257'	Other aftercare	Follow-up examination after combined treatment for malignant neoplasm
'Z08.8 '	'257'	Other aftercare	Follow-up examination after other treatment for malignant neoplasm
'Z08.9 '	'257'	Other aftercare	Follow-up examination after unspecified treatment for malignant neoplasm
'Z09 '	'257'	Other aftercare	Encounter for follow-up examination after completed treatment for conditions other than malignant ne
'Z09.0 '	'257'	Other aftercare	Follow-up examination after surgery for other conditions
'Z09.1 '	'257'	Other aftercare	Follow-up examination after radiotherapy for other conditions
'Z09.2 '	'257'	Other aftercare	Follow-up examination after chemotherapy for other conditions
'Z09.3 '	'257'	Other aftercare	Follow-up examination after psychotherapy
'Z09.4 '	'257'	Other aftercare	Follow-up examination after treatment of fracture
'Z09.7 '	'257'	Other aftercare	Follow-up examination after combined treatment for other conditions
'Z09.8 '	'257'	Other aftercare	Follow-up examination after other treatment for other conditions
'Z09.9 '	'257'	Other aftercare	Follow-up examination after unspecified treatment for other conditions
'Z42 '	'257'	Other aftercare	Follow-up care involving plastic surgery
'Z42.0 '	'257'	Other aftercare	Follow-up care involving plastic surgery of head and neck
'Z42.1 '	'257'	Other aftercare	Follow-up care involving plastic surgery of breast
'Z42.2 '	'257'	Other aftercare	Follow-up care involving plastic surgery of other parts of trunk
'Z42.3 '	'257'	Other aftercare	Follow-up care involving plastic surgery of upper extremity
'Z42.4 '	'257'	Other aftercare	Follow-up care involving plastic surgery of lower extremity
'Z42.8 '	'257'	Other aftercare	Follow-up care involving plastic surgery of other body part
'Z42.9 '	'257'	Other aftercare	Follow-up care involving plastic surgery, unspecified
'Z47 '	'257'	Other aftercare	Other orthopaedic follow-up care
'Z47.0 '	'257'	Other aftercare	Follow-up care involving removal of fracture plate and other internal fixation
'Z47.8 '	'257'	Other aftercare	Other specified orthopaedic follow-up care
'Z47.9 '	'257'	Other aftercare	Orthopaedic follow-up care, unspecified
'Z48 '	'257'	Other aftercare	Other surgical follow-up care
'Z48.0 '	'257'	Other aftercare	Attention to surgical dressings and sutures
'Z48.8 '	'257'	Other aftercare	Other specified surgical follow-up care
'Z48.9 '	'257'	Other aftercare	Surgical follow-up care, unspecified
'Z54 '	'257'	Other aftercare	Convalescence

'Z54.0 '	'257'	Other aftercare	Convalescence following surgery
'Z54.1 '	'257'	Other aftercare	Convalescence following radiotherapy
'Z54.2 '	'257'	Other aftercare	Convalescence following chemotherapy
'Z54.3 '	'257'	Other aftercare	Convalescence following psychotherapy
'Z54.4 '	'257'	Other aftercare	Convalescence following treatment of fracture
'Z54.7 '	'257'	Other aftercare	Convalescence following combined treatment
'Z54.8 '	'257'	Other aftercare	Convalescence following other treatment
'Z54.9 '	'257'	Other aftercare	Convalescence following unspecified treatment
'Z03 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Medical observation and evaluation for suspected diseases and conditions
'Z03.1 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for suspected malignant neoplasm
'Z03.3 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for suspected nervous system disorder
'Z03.4 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for suspected myocardial infarction
'Z03.5 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for other suspected cardiovascular diseases
'Z03.6 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for observation for suspected toxic effect from ingested substance ruled out
'Z03.8 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for other suspected diseases and conditions
'Z03.9 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Observation for suspected disease or condition, unspecified
'Z12 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for neoplasms
'Z12.0 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm of stomach
'Z12.1 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for neoplasm of intestinal tract
'Z12.2 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm of respiratory organs
'Z12.3 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for neoplasm of breast

'Z12.4 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm of cervix
'Z12.5 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm of prostate
'Z12.6 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm of bladder
'Z12.8 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for neoplasms of other sites
'Z12.9 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for malignant neoplasm, site unspecified
'Z13 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for other diseases and disorders
'Z13.0 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for diseases of the blood and blood-forming organs and certain disorders inv
'Z13.1 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for diabetes mellitus
'Z13.2 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for nutritional disorders
'Z13.4 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for certain developmental disorders in childhood
'Z13.5 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for eye and ear disorders
'Z13.6 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening for cardiovascular disorders
'Z13.7 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for congenital malformations, deformations and chromosomal abnormaliti
'Z13.8 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Special screening examination for other specifed diseases and disorders
'Z13.9 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for screening, unspecified
'Z36 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Encounter for antenatal screening of mother
'Z36.0 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening for chromosomal anomalies

'Z36.1 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening for raised alphafetoprotein level
'Z36.2 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Other antenatal screening based on amniocentesis
'Z36.3 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening for malformations using ultrasound and other physical methods
'Z36.4 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening for fetal growth retardation using ultrasound and other physical methods
'Z36.5 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening for isoimmunisation
'Z36.8 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Other antenatal screening
'Z36.9 '	'258'	Other screening for suspected conditions (not mental disorders or infectious disease)	Antenatal screening, unspecified

'Y435 '	'260'	E Codes: All (external causes of injury and	Acidifying and alkalisng agents causing adverse effects in therapeutic use
'Y436 '	'260'	E Codes: All (external causes of injury and	Enzymes, not elsewhere classified causing adverse effects in therapeutic use
'Y438 '	'260'	E Codes: All (external causes of injury and poisoning)	Other primarily systemic agents, not elsewhere classified causing adverse effects in therapeutic use
'Y439 '	'260'	E Codes: All (external causes of injury and	Primarily systemic agent, unspecified causing adverse effects in therapeutic use

'Y440 '	'260'	E Codes: All (external causes of injury and poisoning)	Iron preparations and other anti-hypochromic-anaemia preparations causing adverse effects in therape
'Y441 '	'260'	E Codes: All (external causes of injury and poisoning)	Vitamin B12, folic acid and other anti-megaloblastic-anaemia preparations causing adverse effects in
'Y442 '	'260'	E Codes: All (external causes of injury and poisoning)	Anticoagulants causing adverse effects in therapeutic use
'Y443 '	'260'	E Codes: All (external causes of injury and poisoning)	Anticoagulant antagonists, vitamin K and other coagulants causing adverse effects in therapeutic use
'Y444 '	'260'	E Codes: All (external causes of injury and poisoning)	Antithrombotic drugs [platelet-aggregation inhibitors] causing adverse effects in therapeutic use
'Y445 '	'260'	E Codes: All (external causes of injury and poisoning)	Thrombolytic drugs causing adverse effects in therapeutic use
'Y446 '	'260'	E Codes: All (external causes of injury and poisoning)	Natural blood and blood products causing adverse effects in therapeutic use
'Y447 '	'260'	E Codes: All (external causes of injury and poisoning)	Plasma substitutes causing adverse effects in therapeutic use
'Y449 '	'260'	E Codes: All (external causes of injury and poisoning)	Other and unspecified agents affecting blood constituents causing adverse effects in therapeutic use
'Y450 '	'260'	E Codes: All (external causes of injury and poisoning)	Opioids and related analgesics causing adverse effects in therapeutic use
'Y451 '	'260'	E Codes: All (external causes of injury and poisoning)	Salicylates causing adverse effects in therapeutic use
'Y452 '	'260'	E Codes: All (external causes of injury and poisoning)	Propionic acid derivatives causing adverse effects in therapeutic use
'Y453 '	'260'	E Codes: All (external causes of injury and poisoning)	Other nonsteroidal anti-inflammatory drugs [NSAID] causing adverse effects in
'Y454 '	'260'	E Codes: All (external causes of injury and poisoning)	Antirheumatics causing adverse effects in therapeutic use
'Y455 '	'260'	E Codes: All (external causes of injury and poisoning)	4-Aminophenol derivatives causing adverse effects in therapeutic use
'Y458 '	'260'	E Codes: All (external causes of injury and poisoning)	Other analgesics and antipyretics causing adverse effects in therapeutic use
'Y459 '	'260'	E Codes: All (external causes of injury and poisoning)	Analgesic, antipyretic and anti-inflammatory drug, unspecified causing adverse effects in therapeuti
'Y460 '	'260'	E Codes: All (external causes of injury and poisoning)	Succinimides causing adverse effects in therapeutic use
'Y461 '	'260'	E Codes: All (external causes of injury and poisoning)	Oxazolidinediones causing adverse effects in therapeutic use
'Y462 '	'260'	E Codes: All (external causes of injury and poisoning)	Hydantoin derivatives causing adverse effects in therapeutic use
'Y463 '	'260'	E Codes: All (external causes of injury and poisoning)	Deoxybarbiturates causing adverse effects in therapeutic use
'Y464 '	'260'	E Codes: All (external causes of injury and poisoning)	Iminostilbenes causing adverse effects in therapeutic use
'Y465 '	'260'	E Codes: All (external causes of injury and poisoning)	Valproic acid causing adverse effects in therapeutic use
'Y466 '	'260'	E Codes: All (external causes of injury and poisoning)	Other and unspecified antiepileptics causing adverse effects in therapeutic use
'Y467 '	'260'	E Codes: All (external causes of injury and poisoning)	Antiparkinsonism drugs causing adverse effects in therapeutic use
'Y468 '	'260'	E Codes: All (external causes of injury and poisoning)	Antispasticity drugs causing adverse effects in therapeutic use
'Y470 '	'260'	E Codes: All (external causes of injury and poisoning)	Barbiturates, not elsewhere classified causing adverse effects in therapeutic
'Y471 '	'260'	E Codes: All (external causes of injury and poisoning)	Benzodiazepines causing adverse effects in therapeutic use

'Y472 '	'260'	E Codes: All (external causes of injury and	Cloral derivatives causing adverse effects in therapeutic use
'Y473 '	'260'	E Codes: All (external causes of injury and	Paraldehyde causing adverse effects in therapeutic use
'Y474 '	'260'	E Codes: All (external causes of injury and	Bromine compounds causing adverse effects in therapeutic use
'Y475 '	'260'	E Codes: All (external causes of injury and poisoning)	Mixed sedatives and hypnotics, not elsewhere classified causing adverse effects in therapeutic use
'Y478 '	'260'	E Codes: All (external causes of injury and	Other sedatives, hypnotics and antianxiety drugs causing adverse effects in
'Y479 '	'260'	E Codes: All (external causes of injury and	Sedative, hypnotic and antianxiety drug, unspecified causing adverse effects in
'Y480 '	'260'	E Codes: All (external causes of injury and	Inhaled anaesthetics causing adverse effects in therapeutic use
'Y481 '	'260'	E Codes: All (external causes of injury and	Parenteral anaesthetics causing adverse effects in therapeutic use
'Y482 '	'260'	E Codes: All (external causes of injury and	Other and unspecified general anaesthetics causing adverse effects in
'Y483 '	'260'	E Codes: All (external causes of injury and	Local anaesthetics causing adverse effects in therapeutic use
'Y484 '	'260'	E Codes: All (external causes of injury and	Anaesthetic, unspecified causing adverse effects in therapeutic use
'Y485 '	'260'	E Codes: All (external causes of injury and	Therapeutic gases causing adverse effects in therapeutic use
'Y490 '	'260'	E Codes: All (external causes of injury and	Tricyclic and tetracyclic antidepressants causing adverse effects in therapeutic
'Y491 '	'260'	E Codes: All (external causes of injury and	Monoamine-oxidase-inhibitor antidepressants causing adverse effects in
'Y492 '	'260'	E Codes: All (external causes of injury and	Other and unspecified antidepressants causing adverse effects in therapeutic
'Y493 '	'260'	E Codes: All (external causes of injury and	Phenothiazine antipsychotics and neuroleptics causing adverse effects in
'Y494 '	'260'	E Codes: All (external causes of injury and	Butyrophenone and thioxanthene neuroleptics causing adverse effects in
'Y495 '	'260'	E Codes: All (external causes of injury and	Other antipsychotics and neuroleptics causing adverse effects in therapeutic
'Y496 '	'260'	E Codes: All (external causes of injury and	Psychodysleptics [hallucinogens] causing adverse effects in therapeutic use
'Y497 '	'260'	E Codes: All (external causes of injury and	Psychostimulants with potential for use disorder causing adverse effects in
'Y498 '	'260'	E Codes: All (external causes of injury and	Other psychotropic drugs, not elsewhere classified causing adverse effects in
'Y499 '	'260'	E Codes: All (external causes of injury and	Psychotropic drug, unspecified causing adverse effects in therapeutic use
'Y500 '	'260'	E Codes: All (external causes of injury and	Analeptics causing adverse effects in therapeutic use
'Y501 '	'260'	E Codes: All (external causes of injury and	Opioid receptor antagonists causing adverse effects in therapeutic use
'Y502 '	'260'	E Codes: All (external causes of injury and	Methylxanthines, not elsewhere classified causing adverse effects in
'Y508 '	'260'	E Codes: All (external causes of injury and	Other central nervous system stimulants causing adverse effects in therapeutic
'Y509 '	'260'	E Codes: All (external causes of injury and	Central nervous system stimulant, unspecified causing adverse effects in
'Y510 '	'260'	E Codes: All (external causes of injury and	Anticholinesterase agents causing adverse effects in therapeutic use
'Y511 '	'260'	E Codes: All (external causes of injury and	Other parasympathomimetics [cholinergics] causing adverse effects in
'Y512 '	'260'	E Codes: All (external causes of injury and	Ganglionic blocking drugs, not elsewhere classified causing adverse effects in
'Y513 '	'260'	E Codes: All (external causes of injury and poisoning)	Other parasympatholytics [anticholinergics and antimuscarinics] and spasmolytics, not elsewhere clas

'Y514 '	'260'	E Codes: All (external causes of injury and poisoning)	Predominantly à-adrenoreceptor agonists, not elsewhere classified causing adverse effects in therape
'Y515 '	'260'	E Codes: All (external causes of injury and poisoning)	Predominantly ß-adrenoreceptor agonists, not elsewhere classified causing adverse effects in therape
'Y516 '	'260'	E Codes: All (external causes of injury and poisoning)	à-Adrenoreceptor antagonists, not elsewhere classified causing adverse effects in therapeutic use
'Y517 '	'260'	E Codes: All (external causes of injury and poisoning)	ß -Adrenoreceptor antagonists, not elsewhere classified causing adverse effects in therapeutic use
'Y518 '	'260'	E Codes: All (external causes of injury and poisoning)	Centrally acting and adrenergic-neuron-blocking agents, not elsewhere classified causing adverse eff
'Y519 '	'260'	E Codes: All (external causes of injury and poisoning)	Other and unspecified drugs primarily affecting the autonomic nervous system causing adverse effects
'Y520 '	'260'	E Codes: All (external causes of injury and poisoning)	Cardiac-stimulant glycosides and drugs of similar action causing adverse effects in therapeutic use
'Y521 '	'260'	E Codes: All (external causes of injury and poisoning)	Calcium-channel blockers causing adverse effects in therapeutic use
'Y522 '	'260'	E Codes: All (external causes of injury and poisoning)	Other antidysrhythmic drugs, not elsewhere classified causing adverse effects in therapeutic use
'Y523 '	'260'	E Codes: All (external causes of injury and poisoning)	Coronary vasodilators, not elsewhere classified causing adverse effects in
'Y524 '	'260'	E Codes: All (external causes of injury and poisoning)	Angiotensin-converting-enzyme inhibitors causing adverse effects in
'Y525 '	'260'	E Codes: All (external causes of injury and poisoning)	Other antihypertensive drugs, not elsewhere classified causing adverse effects in therapeutic use
'Y526 '	'260'	E Codes: All (external causes of injury and poisoning)	Antihyperlipidaemic and antiarteriosclerotic drugs causing adverse effects in
'Y527 '	'260'	E Codes: All (external causes of injury and poisoning)	Peripheral vasodilators causing adverse effects in therapeutic use
'Y528 '	'260'	E Codes: All (external causes of injury and poisoning)	Antivaricose drugs, including sclerosing agents causing adverse effects in

October 28, 2011

ACKNOWLEDGEMENTS

We would like to thank the individuals and organizations who provided important insight and feedback on key measure decisions. These include:

The Cancer and Aging Research Group (CARG)

Consultant in Healthcare Safety and Quality
Steven Jencks, MD, MPH

Harvard Medical School
Sharon-Lise Normand, PhD

Mathematica Policy Research, Inc.,
Leslie Conwell, PhD
Thomas Crogan, MD, PhD

National Committee for Quality Assurance
Robert Saunders, PhD
Manasi Tirodkar, PhD

Yale School of Medicine
Charles Cha, MD, FACS; Associate Professor of Surgery (Oncology and Gastrointestinal)
Frank Detterbeck, MD, FACS, FCCP; Professor of Surgery (Section of Thoracic Surgery)
Kevin Schuster, MD, FACS; Assistant Professor of Surgery (Trauma)

In addition, we would like to acknowledge and thank the following individuals and organizations for their contributions: Lein Han, Joel Andress, Karen Nakano, Shari Ling, and Michael Rapp from the Centers for Medicare & Medicaid Services; and Jennifer Mattera and Lori Geary from YNHHS/CORE.

We would also like to acknowledge the very thoughtful and instructive responses to the measure during the public comment period.

GLOSSARY OF TERMS

Term	Definition
Index admission	Any eligible admission to an acute care hospital assessed in the measure for the outcome (readmitted or not within 30 days). (See Section 2.3.2)
Readmission	An admission to an acute care hospital within 30 days of discharge from an acute care hospital. (See Section 2.2). A readmission may in turn serve as an index admission.
Planned readmission	An intentional readmission within 30 days of discharge from an acute care hospital that is a scheduled part of the patient's plan of care. Planned readmissions are not counted as outcomes in this measure. (See Section 2.2.1)
Discharge diagnosis	ICD-9 level code of the principal reason for hospitalization.
Discharge condition category	A group of related discharge diagnosis ICD-9 codes (principal diagnoses), as grouped by the Agency for Healthcare Research and Quality (AHRQ) Clinical Classification Software (CCS). (See Section 2.3.1)
Procedure category	A group of related procedure codes, as grouped by the Agency for Healthcare Research and Quality (AHRQ) Clinical Classification Software (CCS). (See Section 2.4.3)
Specialty cohort	A group of index admissions for patients with related condition categories or procedure categories; this measure includes five cohorts, each with its own risk model. (See Section 2.4.3)
Measure population	The full set of patients with index admissions eligible for inclusion in the measure.
Comorbid risk variable	A variable in the risk-adjustment model intended to account for patient comorbid conditions or age. A risk variable may represent multiple conditions. Each condition is a group of ICD-9 diagnosis codes, as defined by the Centers for Medicare and Medicaid Services Condition Category groups (CCs). (See Section 2.5.3)
Condition risk variable	A variable in the risk-adjustment model intended to account for patient's discharge condition category. Every condition category with more than 1,000 admissions is included as a condition risk variable. Condition categories with fewer than 1,000 admissions are grouped together into a single "low frequency condition" risk variable. This occurs in the medicine, surgery/gynecology and neurology cohorts. (See Table 9, Table 10 and Table 13)
Case mix	The particular illness severity and age characteristics of the patients with index admissions at a given hospital.
Service mix	The particular conditions and procedures of the patients with index admissions at a given hospital.

1. INTRODUCTION

1.1 Overview of Measure

Readmission following hospitalization is a costly and often preventable event. During 2003 and 2004, almost one-fifth of Medicare beneficiaries – more than 2.3 million patients – were rehospitalized within 30 days of discharge.¹ Jencks et. al. estimated that readmissions within 30 days of discharge cost Medicare more than \$17 billion annually.¹ A 2006 Commonwealth Fund report estimated that if national readmission rates were lowered to the levels achieved by the top-performing regions, Medicare would save \$1.9 billion annually.²

Currently, the Centers for Medicare & Medicaid Services (CMS) publicly reports risk-standardized readmission rates (RSRRs) for heart failure, pneumonia and acute myocardial infarction.³⁻⁹ CMS has also developed hospital readmission measures for stroke and for hip and knee replacement, and is developing them for chronic obstructive pulmonary disease and vascular procedures. While it is helpful to assess readmission rates for specific groups of patients, these conditions account for only a small proportion of total readmissions.¹⁰ By contrast, a hospital-wide, all-condition readmission measure could provide a broader assessment of the quality of care at hospitals. Therefore, CMS has contracted with Yale New Haven Health Services Corporation/Center for Outcomes Research and Evaluation (YNHHSC/CORE) to develop a claims-based, risk-adjusted hospital-wide readmission (HWR) measure for public reporting that reflects the quality of care for hospitalized patients in the United States.

In this technical report we provide detailed information on the development of the HWR measure. Briefly, we developed the measure as an all-condition measure designed to capture unplanned readmissions within 30 days of discharge. The HWR measure complies with accepted standards for outcomes measure development, including appropriate risk adjustment and transparency of specifications. We exclude admissions for which we have insufficient data for risk adjustment, patients who leave against medical advice, admissions for medical cancer treatment or for conditions that are not typically cared for in short-stay acute care hospitals, and admissions to PPS-exempt cancer hospitals. The measure does not count planned readmissions in the measure outcome, since they do not represent a quality signal. The overall RSRR is derived from the weighted geometric mean of five statistical models built for groups of admissions that are clinically related: medicine, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology. The five risk adjustment models were developed and validated using two randomly split sample datasets from data combining two calendar years (2007 and 2008). We also validated the performance of the five models using data from 2009. Although we developed the measure using Medicare data, the measure will also be tested in and adapted for all-payer datasets.

1.2 Hospital-wide Readmission as a Quality Indicator

Hospital readmission, for any reason, is disruptive to patients and caregivers, costly to the healthcare system, and puts patients at additional risk of hospital-acquired infections and complications. Readmissions are also a major source of patient and family stress and may contribute substantially to loss of functional ability, particularly in older patients.

Some readmissions are unavoidable and result from inevitable progression of disease or worsening of chronic conditions. However, readmissions may also result from poor quality of care or inadequate transitional care. Transitional care includes effective discharge planning, transfer of

information at the time of discharge, patient assessment and education, and coordination of care and monitoring in the post-discharge period. Numerous studies have found an association between quality of inpatient or transitional care and early (typically 30-day) readmission rates for a wide range of conditions.¹¹⁻¹⁸

Randomized controlled trials have shown that improvement in the following areas can directly reduce readmission rates: quality of care during the initial admission; improvement in communication with patients, their caregivers and their clinicians; patient education; pre-discharge assessment; and coordination of care after discharge.¹⁹⁻³⁴ Successful randomized trials have reduced 30-day readmission rates by 20-40%. Widespread application of these clinical trial interventions to general practice has also been encouraging. Since 2008, 14 Medicare Quality Improvement Organizations have been funded to focus on care transitions, applying lessons learned from clinical trials. Several have been notably successful in reducing readmissions within 30 days.³⁵ Evidence that hospitals have been able to reduce readmission rates through these quality-of-care initiatives illustrates the degree to which hospital practices can affect readmission rates.

Despite these isolated successful interventions, the overall national readmission rate remains high, with a 30-day readmission following nearly one fifth of discharges. Furthermore, readmission rates vary widely across institutions.^{5,7,8} Both the high baseline rate and the variability across institutions speak to the need for a quality measure to prompt more concerted and widespread action.

Given that studies have shown readmissions within 30 days to be related to quality of care, that interventions have been able to reduce 30-day readmission rates for a variety of specific conditions, and that high and variable readmission rates indicate opportunity for improvement, it is reasonable to consider an all-condition 30-day readmission rate as a quality measure.

1.3 Approach to Measure Development

We developed this measure in consultation with national guidelines for publicly reported outcomes measures, following the technical approach to outcomes measurement set forth in National Quality Forum (NQF) guidance for outcomes measures,³⁶ CMS Measure Management System guidance, and the guidance articulated in the American Heart Association scientific statement, "Standards for Statistical Models Used for Public Reporting of Health Outcomes."³ These standards include adequate risk adjustment and transparency. We sought and obtained expert input during measure development, both through CMS and consultation with clinical and statistical experts. We also received input from the general public during a public comment period.

2. METHODS

2.1 Overview

This measure reports the hospital-level, risk-standardized rate of unplanned readmission within 30 days of hospital discharge for any condition. The measure comprises a single summary score, derived from the results of five different models, one for each of the following specialty cohorts (groups of discharge condition categories or procedure categories): medicine, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology, each of which will be described in greater detail below. The measure uses one year of data to assess hospital performance.

Hospitalizations are eligible for inclusion in the measure if the patient was age 65 or older, was hospitalized at a non-Federal short-stay acute-care hospital or critical access hospital, was continuously enrolled in fee-for-service (FFS) Medicare Part A for one month after discharge, was not discharged to another acute care hospital, and was alive upon discharge. These hospitalizations form the starting cohort. We exclude admissions for which we have insufficient data for risk adjustment (patients who were not enrolled in FFS Medicare Part A for 12 months prior to admission), patients who leave against medical advice, admissions for medical cancer treatment or for conditions that are not typically cared for in short-stay acute care hospitals (admissions with a primary psychiatric diagnosis or primary rehabilitation diagnosis), and admissions to PPS-exempt cancer hospitals. We exclude planned readmissions, which are not a quality signal. To compare readmission performance across hospitals, the measure accounts for differences in patient characteristics (patient case mix) as well as differences in mixes of services and procedures offered by hospitals (hospital service mix). The measure covers 93.1% of hospitalizations occurring in 2008 in the starting cohort, and includes 92.1% of readmissions following those hospitalizations (see Figure 2).

To define the conditions and procedures in the measure, we collapsed the more than 17,000 different International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) diagnosis and procedure codes into 285 clinically-coherent, mutually-exclusive condition categories and 231 mutually-exclusive procedure categories using the Agency for Healthcare Research and Quality (AHRQ) Clinical Classification Software (CCS).³⁷

We created five major specialty cohorts based on organization of care, and assigned each condition category to a cohort. Admissions that included major surgical procedures (regardless of condition category) were assigned to the surgery/gynecology cohort. We built a separate model for each one of these cohorts. We used a development dataset and logistic regression models to evaluate and select a single set of risk factors for readmission that was then applied to every model. We used hierarchical logistic regression to adjust for differences in hospital case mix and to account for the clustering of patients within a hospital. We adjusted for case mix differences among hospitals by risk-adjusting for patients' comorbid conditions identified in inpatient episodes of care for the 12 months prior to the index admission as well as those present at admission. We did not risk-adjust for diagnoses that may have been a complication of care during the index admission. We used CMS Condition Category groups (CMS-CCs) to define the comorbid risk adjusters and used a fixed set of comorbid risk variables across models. We risk-adjusted for service mix differences among hospitals within each major cohort by including indicator variables for discharge condition categories (as defined by AHRQ CCS) in each model.

Finally, we used each of the five models to calculate predicted and expected numbers of readmissions (as defined below in Section 2.6.1) for each hospital in each cohort. We then derived a single summary score from the results of the five models by calculating the volume-weighted log average (that is, the geometric mean) of the predicted over expected ratios from each model and multiplying the resulting ratio by the average national readmission rate. This approach allowed us to take into account the variation in hospital specialty cohort mix.

We evaluated the performance of the measure for various types of hospitals and groups of patients. We then tested the reliability of the measure by randomly splitting combined 2007 and 2008 data and comparing the performance in each split sample. For temporal validation, we also tested the measure's performance in 2009 data.

2.2 Outcome Definition

The outcome for this measure is unplanned all-cause 30-day readmission. We define a readmission as a subsequent inpatient admission to any acute care facility which occurs within 30 days of the discharge date of an eligible index admission. Any readmission is eligible to be counted as an outcome except those that are considered planned.

2.2.1 Planned readmissions

Readmissions may be either unplanned or planned. Unplanned readmissions are acute clinical events experienced by a patient that require urgent hospital admission. Higher than expected unplanned readmission rates suggest lower quality of care and are the focus of quality measurement as part of quality improvement efforts. Because planned readmissions are not a signal of quality of care, we chose to exclude planned readmissions from being considered as outcome. We developed an algorithm for identifying "planned readmissions" in claims data that will not count as readmissions in the measure. The algorithm was based on two main principles:

- a. We define "planned" readmissions as those in which one of a pre-specified list of procedures (presented below) took place, or those for maintenance chemotherapy or rehabilitation. Maintenance chemotherapy and rehabilitation are common planned readmissions that are reliably distinguishable in the data even though they are not accompanied by procedures. Although other readmissions may also be planned for medical reasons, these are rare, and there is no reliable means of identifying them in administrative claims data.
- b. Admissions for acute illness or for complications of care are not "planned." Any procedure completed during an admission for an acute illness is not likely to have been planned, even if that procedure is usually planned in other non-acute cases. We identify readmissions as acute or non-acute by considering the principal discharge condition.

We therefore developed an algorithm that uses procedure codes and discharge diagnosis categories for each readmission to identify planned readmissions. Readmissions that occur for planned procedures (listed below) and which are not for acute diagnoses or complications of care (listed below) are identified as planned.

The following examples illustrate this point:

Example 1:

- A readmission with a discharge condition category of biliary tract disease that included a cholecystectomy would be considered **planned**
- A readmission with a discharge condition category of septicemia that included a cholecystectomy would be considered **unplanned**
- A readmission with a discharge condition category of “complications of surgical procedures or medical care” that included a cholecystectomy would be considered **unplanned**

Example 2:

- A readmission with a discharge condition category of coronary atherosclerosis that included a percutaneous coronary intervention (PCI) would be considered **planned**
- A readmission with a discharge condition category of acute myocardial infarction that included PCI would be considered **unplanned**

Therefore, the HWR measure defines planned readmissions as any readmission that was either:

- A **non-acute** readmission in which one of 35 typically planned procedures occurs
or
- A readmission for maintenance chemotherapy

All other readmissions are considered unplanned and are counted as readmissions in the measure.

List of planned procedures

In order to develop a list of planned procedures, we reviewed the full AHRQ CCS procedure category list and identified 32 procedure categories that are typically planned and require an inpatient stay. After receiving public comments, we added two procedure categories and a group of related ICD-9 procedure codes to this list. Readmissions in which any of these procedures are performed are considered planned if the discharge condition category is not acute or a complication of care (Table 1).

Table 1 – Procedure categories considered planned

AHRQ CCS	Description	Readmissions with no excluding diagnosis ("planned" readmissions)		Total readmissions	
		Number	Percent of total planned readmissions	Number	Percent of total planned readmissions
45	Percutaneous transluminal coronary angioplasty (PTCA)	12,038	13.8%	19,719	13.0%

*Data from 2008 MedPAR file, incorporating all final inclusion and exclusion criteria for the measure

List of discharge condition categories that are acute or complications of care

According to our algorithm, admissions in which a planned procedure was performed are only considered “planned” if the patient was not admitted for an acute illness or complication of care. To develop a list of these acute and complication discharge condition categories, we reviewed the 10 most frequent discharge condition categories associated with each of our final set of 35 potentially planned procedures (Appendix A – Top 10 primary discharge diagnoses for each planned procedure). From this set of 350 condition categories, we identified those which could be categorized as acute illnesses or complications of medical care. Each discharge condition category includes a number of diagnosis ICD-9 codes. When a discharge condition category contained a mix of acute and chronic diagnoses, it was categorized as acute. Based on these criteria, we categorized 27 discharge condition categories as acute or complications of care, all listed within Table 2.

Table 2 – Discharge condition categories considered acute or complications of care

AHRQ CCS	Description	30-day readmissions with this condition and one of the planned procedures
237	Complication of device; implant or graft	11,689
106	Cardiac dysrhythmias	10,267
	Fracture (condition CCS 207, 225, 226, 227, 229, 230, 231, 232)	6,307
100	Acute myocardial infarction	5,643
238	Complications of surgical procedures or medical care	5,438
108	Congestive heart failure; nonhypertensive	5,119
2	Septicemia (except in labor)	3,372
146	Diverticulosis and diverticulitis	2,434
105	Conduction disorders	2,130
109	Acute cerebrovascular disease	1,886
145	Intestinal obstruction without hernia	1,341

233	Intracranial injury	1,271
116	Aortic and peripheral arterial embolism or thrombosis	1,115
122	Pneumonia (except that caused by TB or sexually transmitted disease)	710
131	Respiratory failure; insufficiency; arrest (adult)	678
157	Acute and unspecified renal failure	645
201	Infective arthritis and osteomyelitis (except that caused by TB or sexually transmitted disease)	608
153	Gastrointestinal hemorrhage	566
130	Pleurisy; pneumothorax; pulmonary collapse	510
97	Peri-; endo-; and myocarditis; cardiomyopathy	484
127	Chronic obstructive pulmonary disease and bronchiectasis	462
55	Fluid and electrolyte disorders	424
159	Urinary tract infections	410
245	Syncope	353
139	Gastroduodenal ulcer (except hemorrhage)	133
160	Calculus of urinary tract	98
112	Transient cerebral ischemia	88
	All condition categories	64,181

We quantified the impact of our decisions regarding the definition of planned readmissions on readmission rates. In 2008, there were 127,785 planned readmissions in the final cohort, accounting for 9% of all readmissions.

2.2.2 Thirty-day timeframe

We considered 30 days as a clinically reasonable timeframe for multiple reasons:

- a. Within a 30-day time frame, readmissions are more likely attributable to care received during the index hospitalization and during the transition to the outpatient setting. A number of studies have demonstrated that improvements in care at the time of patient discharge can reduce 30-day readmission rates.^{19,20,22,27-34,38} Hospitals, in collaboration with their medical communities, can take a number of actions to reduce readmissions: ensure patients are clinically ready at discharge; reduce risk of infection; reconcile medications; improve communications among providers involved in transition of care; encourage strategies that promote disease management principles; and educate patients about symptoms to monitor, whom to contact with questions, and where and when to seek follow-up care.^{19,20,22,27-34,38} Studies also show that it can take more than 14 days for the benefits of these interventions to appear.³⁹
- b. The 30-day timeframe is consistent with the other CMS readmission measures approved by the National Quality Forum (NQF) and publicly reported by CMS.
- c. In addition to clinical judgment, we reviewed “time to event” curves of readmission over time to decide whether the 30-day timeframe captures the quality signal provided by readmission rates. The readmission “time-to-event curves” showed a very similar

pattern for all discharge condition categories: a rapid early accrual of readmissions, with a stable and consistent readmission rate (slope) thereafter, likely reflecting patients' return to baseline admission risk. Curves typically stabilized within 30 days of discharge, indicating that a 30-day cutoff is clinically reasonable, although alternative time frames (e.g. 15 or 45 days) would also capture a quality signal. Time-to-event curves for 24 of the most common discharge condition categories are shown in Figure 1.

- d. We considered shorter but not longer time frames compared to 30 days given: (1) the literature findings showing the effectiveness of interventions designed to decrease 30-day rates and (2) the diminishing influence of hospital-initiated interventions on the post-discharge course for longer observation periods. We compared the proportion of total variation that was at the hospital level for both 15-day readmissions and 30-day readmissions (adjusted only for age and sex) to determine whether 30-day outcomes were less related to hospital care than 15-day readmissions. In fact, results were similar for both outcomes: the proportion of the total variation that was at the hospital level was 3.2% for 15-day readmissions and 2.8% for 30-day readmissions.
- e. In summary, we chose a post-discharge observation period of 30-days balancing considerations of empiric data findings, actionability, measure harmonization, and fairness of attribution.

Figure 1 – Graphical representation of time to readmission

1a: Cardiovascular conditions

1b: Gastrointestinal conditions

1c: Orthopedic conditions and complications of care

1d: Pulmonary conditions

2.2.3 All-cause readmission

We defined the outcome as “all-cause” unplanned readmissions rather than readmissions related to the previous hospitalization for multiple reasons. First, from the patient perspective, readmission for any reason is likely to be an undesirable outcome of care. Furthermore, readmission for any reason exposes the patient to risks associated with hospitalization, such as iatrogenic errors. Second, there is no reliable way to determine whether a readmission is related to the previous hospitalization based on the documented cause of readmission. For example, a stroke patient who develops aspiration pneumonia may ultimately be readmitted for respiratory distress. It would be inappropriate to treat this readmission as unrelated to the care the patient received for stroke. Third, the range of potentially avoidable readmissions also includes those not directly related to the index condition category, such as those resulting from medication reconciliation errors, poor communication at discharge, or inadequate follow-up post-discharge. Creating a comprehensive list of potentially avoidable readmissions related to the previous hospitalization’s condition category would be arbitrary and, ultimately, challenging to implement. Fourth, all existing CMS readmission measures report all-cause readmission, making this approach consistent with existing measures. Fifth, research shows that readmission reduction interventions can reduce all-cause readmission, not only condition-specific readmission. Finally, defining the outcome as all-cause readmissions may encourage hospitals to implement broader initiatives aimed at improving the overall care within the hospital and transitions from the hospital setting instead of limiting the focus to a narrow set of condition-specific approaches.

2.3 Definition of Eligible Admissions

Our guiding principle for defining eligible admissions was that the measure should capture as many unplanned readmissions as possible across a maximum number of acute care hospitals. Therefore we included in the measure all admissions except those for which full data were not available or for which 30-day readmission cannot reasonably be considered a signal of quality of care.

2.3.1 Grouping patients into clinically coherent discharge condition categories by using AHRQ CCS

For our previous claims-based condition- and procedure-specific outcomes measures we have used individual ICD-9 codes of the index admission to define the cohort. For the HWR measure, using ICD-9 codes would have been very impractical because there are potentially thousands of ICD-9 codes that would have to be included. Therefore, we aggregated ICD-9 codes into clinically coherent conditions.

To aggregate these codes, we chose the AHRQ CCS. We selected CCS because it is well-known and widely used; it is based on the principal diagnosis and not on complications or events that occur during hospitalization (unlike the Medicare Severity Diagnosis Related Groups [MS-DRGs]); and because it was developed using Healthcare Cost and Utilization Project data (unlike CMS-CCs),⁴⁰ making it more applicable to all-payer data. The AHRQ CCS has been used by managed care plans, insurers and researchers for a variety of functions, such as assessing resource use, predicting future expenses, comparing procedure or condition rates among payers or hospitals, or profiling patients. There are a total of 285 mutually exclusive AHRQ condition categories, most of which are single, homogenous diseases such as pneumonia or acute myocardial infarction. Some are aggregates of conditions, such as “other bacterial infections.” Mental health and substance abuse categories are included. In addition, AHRQ provides 231 mutually exclusive procedure categories to group procedures a patient might have had during hospitalization.

2.3.2 Inclusion / exclusion criteria

Admissions are eligible for inclusion in the measure if:

- a. Patient is 65 or older
Rationale: Younger Medicare patients represent a distinct population with dissimilar characteristics and outcomes. Of note, when the measure is applied to all-payer data, it will apply to patients 18 and older, including younger Medicare patients.
- b. Patient survives hospitalization
Rationale: Patients who die during the initial hospitalization cannot be readmitted.
- c. Patient is discharged home or to a non-acute setting
Rationale: In an episode of care in which patient is transferred among hospitals, responsibility for the readmission is assigned to the final discharging hospital. Therefore intermediate admissions within a single episode of care are not eligible for inclusion.

These inclusion criteria are consistent with existing CMS publicly reported measures for readmission.

We then applied several exclusion criteria to the measure population (“starting cohort”). Criteria a-c are consistent with existing measures; the remainder are unique to the HWR measure. See Figure 2.

- a. Admissions for patients without at least 30 days of post-discharge enrollment in FFS Medicare
Rationale: This is necessary in order to identify the outcome (readmission) in the dataset.
- b. Admissions for patients not continuously enrolled in FFS Medicare for the 12 months prior to the index admission are excluded
Rationale: This is necessary to ensure full historical data for risk adjustment
- c. Patients discharged against medical advice (AMA) are excluded
Rationale: Hospitals had limited opportunity to implement high quality care
- d. Admissions for patients to a PPS-exempt cancer hospital are excluded
Rationale: These hospitals care for a unique population of patients that cannot reasonably be compared to the patients admitted to other hospitals.
- e. Admissions for medical treatment of cancer are excluded
Rationale: These admissions have a very different mortality and readmission profile than the rest of the Medicare population, and outcomes for these admissions do not correlate well with outcomes for other admissions. See Section 2.4.3 for details of this exclusion. As described in Section 2.4.3, patients with cancer who are admitted for other diagnoses or for surgical treatment of their cancer remain in the measure. See Table 3 for excluded CCS.

Table 3 – Cancer discharge condition categories excluded from the measure

AHRQ CCS	Description	Admits*
42	Secondary malignancies	45,319
19	Cancer of bronchus; lung	30,292
45	Maintenance chemotherapy; radiotherapy	21,522
44	Neoplasms of unspecified nature or uncertain behavior	10,160
17	Cancer of pancreas	8,462
38	Non-Hodgkin’s lymphoma	7,977
39	Leukemias	7,809
14	Cancer of colon	6,121
40	Multiple myeloma	4,624
35	Cancer of brain and nervous system	3,561
16	Cancer of liver and intrahepatic bile duct	3,491
13	Cancer of stomach	3,467
29	Cancer of prostate	3,100
15	Cancer of rectum and anus	3,030

18	Cancer of other GI organs; peritoneum	2,974
12	Cancer of esophagus	2,533
11	Cancer of head and neck	2,515
27	Cancer of ovary	2,081
33	Cancer of kidney and renal pelvis	1,863
32	Cancer of bladder	1,807
24	Cancer of breast	1,682
43	Malignant neoplasm without specification of site	1,451
25	Cancer of uterus	1,132
36	Cancer of thyroid	879
21	Cancer of bone and connective tissue	763
41	Cancer; other and unspecified primary	674
20	Cancer; other respiratory and intrathoracic	632
23	Other non-epithelial cancer of skin	593
26	Cancer of cervix	586
28	Cancer of other female genital organs	326
34	Cancer of other urinary organs	301
37	Hodgkin`s disease	236
22	Melanomas of skin	212
31	Cancer of other male genital organs	34
30	Cancer of testis	4
	Total	182,213*

*After all other exclusions applied

- f. Admissions for primary psychiatric disease are excluded
Rationale: Patients admitted for psychiatric treatment are typically cared for in separate psychiatric or rehabilitation centers which are not comparable to acute care hospitals. See Table 4 for excluded CCS:

Table 4 – Psychiatric discharge condition categories excluded from the measure

AHRQ CCS	Description	Admits*
657	Mood disorders	7,874
659	Schizophrenia and other psychotic disorders	7,849
651	Anxiety disorders	3,153
670	Miscellaneous disorders	1,315
654	Developmental disorders	594
650	Adjustment disorders	399
658	Personality disorders	127
652	Attention-deficit, conduct, and disruptive behavior disorders	119
656	Impulse control disorders, NEC	27

655	Disorders usually diagnosed in infancy, childhood, or adolescence	16
662	Suicide and intentional self-inflicted injury	10
	Total	21,483*

*After all other exclusions applied

- g. Admissions for “rehabilitation care; fitting of prostheses and adjustment devices” (CCS 254) are excluded
Rationale: These admissions are not typically admitted to an acute care hospital and are not for acute care

Note that a readmission within 30-days will also be eligible as an index admission, if it meets all other eligibility criteria. This allows our measure to capture repeated readmissions for the same patient, whether at the same hospital or another. Since there are few patients with multiple admissions in the same year in the same specialty cohort, it is difficult to model the within patient variance; thus, we chose to treat these multiple admissions as statistically independent.

2.4 Administrative Model Development

2.4.1 Data sources

To develop the measure, we constructed three datasets:

1. The index dataset contains administrative inpatient hospitalization data for FFS Medicare beneficiaries, 65 and older on admission, hospitalized in 2008
2. The history dataset includes inpatient hospitalization data on each patient for the 12 months prior to the index admission
3. The post-index dataset contains inpatient hospitalization data on each patient in the 30 days following discharge.

We obtained index admission, readmission, and in-hospital comorbidity data from the Medicare Provider Analysis and Review (MedPAR) file. Enrollment and post-discharge mortality status were obtained from the Medicare Enrollment Database, which contains beneficiary demographic, benefit, coverage, and vital status information.

Comorbidities were assessed using data from the index admission and any admissions in prior year. The Medicare physician (Part B) data were not included because 1) this was technically cumbersome, and 2) it would make expanding the measure later to an all-payer population very difficult (all-payer data typically includes only data for hospitalized patients, not office visits).

The selection of the final measure population is illustrated in Figure 2.

Figure 2 – Inclusion and exclusion criteria (numbers of admissions based on 2008 MedPAR data)

Hospital Wide All Condition 30-Day All-Cause Readmission Measure

* Not mutually exclusive

2.4.2 Modeling approach

Because the risk of readmission varies with patient factors, including age and comorbidities, hospital comparisons using readmission rates need to account for differences in these factors. To adjust for such “case mix” differences we used regression analysis, including age and comorbidity risk variables. Rather than assume that the effect of risk variables would be homogeneous across all discharge condition categories, we assessed the performance of a single model versus multiple models of groups of condition categories. Our analyses showed consistently that a single model was slightly inferior to multiple models for specialty cohorts. Using multiple models yielded better discrimination and predictive ability for readmission risk (Table 5). The Integrated Discrimination Improvement (IDI) score for the multiple model regression analysis was 0.001, $P < 0.001$.⁴¹

Table 5 – C statistics for single model and multiple models

Modeling approach	C statistic	95% confidence interval
Single overall model	0.656	0.655 – 0.656
Five models combined	0.658	0.657 – 0.658

Another consideration in grouping discharge condition categories into models for specialty cohorts rather than into a single model was that readmission risk varies according to discharge condition as well as according to age and comorbidities. Hospitals vary in their mix of conditions and procedures (“service mix”). By modeling readmission separately for different groups of conditions or procedures, we can better account for differences in service mix across hospitals.

In particular, we wanted to be careful to fully account for the differences in readmission risk between surgical and non-surgical patients. Our analyses found that even within the same discharge condition, patient risk was strongly affected by whether a surgical procedure was performed during hospitalization. Patients undergoing surgical procedures typically had better outcomes than patients who did not undergo a procedure but were admitted with the same discharge condition. Examples are shown in Table 6.

Table 6 – Example readmission rates for admissions with and without surgical procedures

AHRQ CCS	Description	Without surgical procedure			With surgical procedure		
		Total admits	Total readmits	Readmit rate	Total admits	Total readmits	Readmit rate
100	Acute myocardial infarction	116,810	25,035	21.40%	80,208	13,197	16.50%
149	Biliary tract disease	33,718	5,443	16.10%	66,034	7,444	11.30%
205	Spondylosis; intervertebral disc disorders; other back problems	46,916	7,395	15.80%	103,542	7,693	7.40%
237	Complication of device; implant or graft	81,549	18,771	23.00%	108,171	17,096	15.80%

In theory, estimating many more models, such as a separate model for each of the 285 condition categories, would provide the best discrimination of readmission risk at the patient level. However, if we did so, many hospitals would not be included in most such models; for all but the most common discharge condition categories, many hospitals would not have an index admission in that category during a given year. In addition, most other hospitals would have only very small numbers of index admissions in each discharge condition category, meaning that the model would contribute very little to their overall measurement. Thus, we balanced the desire for more models to maximize discrimination of readmission risk with the need to minimize models to ensure results would be obtainable for most hospitals, and developed five distinct models.

Finally, and most importantly, the multiple model approach, which combines individual measures from each model into a single measure, will increase the practical utility of the measure by illuminating differences in performance among specialty areas within hospitals. This attribute of the measure will allow hospitals to better target quality improvement efforts and received favorable public comments.

In summary, using five models rather than a single model marginally improves model performance and patient-level discrimination, and will significantly improve the usability of the measure. Using many more models was not feasible given the number of cases per hospital in each condition.

2.4.3 Cohorts are defined by care team or clinical coherence

In this step we organized admissions into mutually exclusive cohorts. We created five cohorts: medicine, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology. We examined but ultimately discarded the possibility of additional cohorts for gynecology patients, psychiatric patients, and medical cancer treatment patients. Instead, gynecology admissions were folded into the surgery category due to limited numbers, while admissions for primary psychiatric disease or medical cancer treatment were excluded altogether (see Section 2.3.2). Patients with psychiatric or cancer comorbidities admitted for other medical conditions or for surgical treatment remained in the measure (see Section 2.4.3b below). We built a separate model for each cohort.

- a. **Rationale for clinically-defined cohorts:** We expect the hospital component of readmission risk to be in part related to the care provided by a team of doctors, nurses, care coordinators, pharmacists, etc. Conditions typically cared for by the same team of clinicians would therefore be expected to experience similar added (or reduced) levels of readmission risk. Therefore, we grouped discharge condition categories typically cared for by the same group of clinicians into five cohorts: medicine, surgery/gynecology, cardiorespiratory, cardiovascular, and neurology. Organizing results by care team (specialty) in this way will allow hospitals to identify areas of strength and weakness if hospital performance varies across areas.
- b. **Rationale for excluding patients undergoing cancer treatment:** We initially developed a separate specialty cohort for patients admitted with a principal diagnosis condition of cancer who did not undergo a major surgical procedure. These are patients undergoing medical treatment of their cancer. We found that this cohort had more than twice the post-discharge mortality of any other cohort, indicating substantial competing risk of mortality in the post-discharge period. Such competing mortality risk raises

concern that readmission by itself is not a sufficient quality indicator in this population. Furthermore, this cohort had a planned readmission rate six times that of any other cohort – 41% of readmissions in this cohort were considered planned – raising concern that readmission in this population is a different phenomenon than for other cohorts. Most importantly, this cohort’s standardized readmission ratio (SRR) was poorly correlated with the composite hospital-wide SRR, especially compared to other cohorts (Table 7). See Section 2.6.2 for explanation of SRR. The internal consistency of the measure (Cronbach’s alpha) improved substantially when the cancer treatment cohort was removed (Table 7). Consequently, we elected to exclude this subset of cancer patients from the measure altogether (see Section 2.3.2). It is important to note that patients with secondary diagnoses of cancer admitted for other reasons are still included in this measure based on discharge diagnosis condition, as are patients with a primary or secondary diagnosis of cancer undergoing a procedure (i.e. a patient with a secondary diagnosis of lung cancer who was admitted with pneumonia would be in the cardiorespiratory cohort; a patient admitted for partial colectomy to treat colon cancer would be in the surgical cohort).

Table 7 – Correlation of model SRRs with composite SRR

Model	Correlation with composite SRR*	Cronbach’s alpha of composite measure <i>without</i> model*
Medicine	0.732	0.724
Surgery/gynecology	0.652	0.747
Cardiorespiratory	0.663	0.777
Cardiovascular	0.541	0.744
Neurology	0.553	0.772
Cancer treatment	0.228	0.835

*higher number indicates a better correlation

2.4.4 Approach to individual cohorts

(See Table 9, Table 10, Table 11, Table 12, and Table 13 for specific list of conditions in each cohort):

a. **Surgery/Gynecology**

This cohort includes admissions likely cared for by surgical or gynecologic teams. In order to be confident that these patients were actually cared for by surgical or gynecologic teams, we used AHRQ *procedure* categories (rather than AHRQ condition categories) to identify these patients. A patient could only be assigned to the surgery/gynecology cohort if s/he underwent a surgical procedure. We reviewed the list of AHRQ procedure categories and identified those which could typically result in surgical or gynecological teams caring for the patient. Minor procedures that would not have required a patient to be on the surgical service were not included in the list (for example: breast biopsy). Procedures that would generally accompany other, more major, procedures were also not included in the list on the assumption that patients undergoing these procedures would also undergo another procedure on the list (for example, intraoperative cholangiogram). The full list of procedures assigned to the surgery/gynecology cohort is summarized in Appendix B – Procedure categories

defining the surgery/gynecology cohort (2008 data). Any admission during which a procedure from the final list was performed was assigned to the surgery/gynecology cohort.

We elected not to subdivide the surgical cohort on the basis of elective vs. non-elective surgery because whether elective or non-elective, patients are still cared for by the same care teams. Our risk adjustment includes discharge condition category as a risk variable, which we expect to account for differences in risk according to why a procedure was performed.

We elected not to subdivide the surgical cohort on the basis of surgical subspecialty because many patients undergo procedures in more than one subspecialty and there is no reliable means of identifying which patients are on which teams. Furthermore, apart from the care provided by the surgeons themselves, most care provided to surgical patients is not sub-specialty-specific.

We elected not to treat gynecology patients as a separate cohort for several reasons. First, most hospitals had too few gynecology patients in the >65 age group to develop reliable models. Second, gynecology patients cannot reliably be distinguished from surgery patients on the basis of procedures since many undergo both surgical and gynecological procedures during the same admission. For example, 7% of gynecological procedures were performed during an admission for a gastrointestinal condition.

b. Cardiorespiratory

This cohort includes several conditions with very high readmission rates – pneumonia, chronic obstructive pulmonary disease, and heart failure – as well as admissions for other condition categories related to these three (asthma, acute bronchitis, pulmonary heart disease, cystic fibrosis and respiratory failure). We combined these patients into a single cohort because patients with these diseases are often clinically indistinguishable, are typically treated by the same care teams, and are often simultaneously treated for several of these diagnoses. Although patients with heart failure may be cared for by a separate cardiac or cardiovascular team, they are also often cared for by general medicine teams. Examination of our data revealed that 22.7% of admissions for heart failure included a secondary diagnosis of pneumonia or COPD, indicating a high degree of overlap between these three conditions. By contrast only 8.5% of admissions for heart failure included a secondary diagnosis of acute coronary syndrome or acute myocardial infarction.

c. Cardiovascular

This cohort includes cardiovascular condition categories such as acute myocardial infarction that in large hospitals might be cared for by a separate cardiac or cardiovascular team.

d. Neurology

This cohort includes neurologic condition categories such as stroke that in large hospitals might be cared for by a separate neurology team.

e. Medicine

This cohort includes all non-surgical patients who were not assigned to any of the cohorts above.

2.4.5 Assignment of admissions to cohorts

Admissions are first screened for the presence of an eligible surgical procedure category. Admissions with any of these procedures are assigned to the surgical cohort, regardless of the diagnosis code of the admission. The AHRQ procedure categories for the surgery/gynecology cohort are shown in Appendix B – Procedure categories defining the surgery/gynecology cohort (2008 data).

All remaining admissions are assigned to cohorts on the basis of the discharge condition category. The AHRQ discharge condition categories for the non-surgical groups are shown in Appendix C – Condition categories assigned to the specialty cohorts.

Summary results for the five cohorts are shown in Table 8.

Table 8 – Admissions, readmissions and mortality for the five cohorts (2008)

Specialty cohort	Admits	30-day unplanned readmits	Unadjusted 30-day unplanned readmit rate	30-day post-discharge deaths - without readmit	30-Day post-discharge mortality rate without readmit	Planned readmits	Unadj. planned 30-day readmit rate	% all readmits that are planned
	(A)	(R)	(=R/A)	(M)	(=M/A)	(P)	(=P/A)	(=P/R)
Medicine	3,086,792	556,131	18.0%	155,395	5.0%	34,492	1.1%	6%
Surgery/gynecology	2,163,279	272,830	12.6%	37,678	1.7%	55,803	2.6%	17%
Cardio-respiratory	1,405,267	297,749	21.2%	74,674	5.3%	16,867	1.2%	5%
Cardio-vascular	843,373	128,224	15.2%	22,158	2.6%	15,912	1.9%	11%
Neurology	459,189	66,917	14.6%	30,308	6.6%	4,710	1.0%	7%
Total	7,957,901	1,321,851	16.6%	298,072	3.7%	127,784	1.6%	9%

2.5 Risk Adjustment

The goal of risk adjustment is to account for differences across hospitals in patient demographic and clinical characteristics that might be related to the outcome but are unrelated to quality of care. Risk adjustment for this measure is complicated by the fact that it includes many different discharge condition categories. We must therefore adjust both for case mix differences (clinical status of the patient, accounted for by adjusting for comorbidities) and service mix differences (the types of conditions/procedures cared for by the hospital, accounted for by adjusting for the discharge condition category). Consistent with NQF guidelines, we did not adjust for socioeconomic status, gender, race, or ethnicity because hospitals should not be held to different standards of care based on the demographics of their patients. We did not adjust for patients' admission source or discharge

disposition (e.g. skilled nursing facility) because these factors are associated with structure of the health care system, and may reflect the quality of care delivered by the system.

2.5.1 Inpatient claims data

The HWR risk-adjustment models use only inpatient claims data (history and current) in order to make it feasible to implement with Medicare data, and to make it applicable to all-payer data, which are typically restricted to inpatient claims. The impact of not including outpatient data (Part B) on model performance has been studied for six publicly reported outcome measures (AMI, HF, and pneumonia 30-day risk-standardized mortality and readmission rates) and the results reported in a separate memo to CMS.⁴²

The results showed that in absence of Part B data, the prevalence of most risk factors was lower, while the magnitude of effect for most risk factors was similar. A reclassification analysis comparing a model with full data to a model with only admission claims data demonstrated good patient-level risk prediction: for all six measures, over 95% of patients were in a similar risk category regardless of risk-adjustment dataset, and the integrated discrimination improvement (IDI) values were relatively low. The models' c statistics were also similar between the two approaches (0.713 vs. 0.725 for AMI mortality; 0.681 vs. 0.684 for HF mortality; 0.713 vs. 0.719 for pneumonia mortality; 0.619 vs. 0.614 for AMI readmission; 0.610 vs. 0.611 for HF readmission; and 0.632 vs. 0.628 for pneumonia readmission). Finally when comparing the model with full data and with only admission claims data, hospital-level risk-standardized rates were highly correlated (ICC=0.984 for AMI mortality; ICC=0.993 for HF mortality; ICC=0.989 for pneumonia mortality; ICC=0.950 for AMI readmission; ICC=0.978 for HF readmission; and ICC=0.985 for pneumonia readmission).

Consequently we expect that using only inpatient data in this measure has had minimal impact on model performance and predictive ability.

2.5.2 Complications of hospitalization

Complications occurring during hospitalization are not comorbid illnesses, may reflect hospital quality of care, and therefore should **not** be used for risk adjustment. Although adverse events during hospitalization may increase the risk of readmission, including them as covariates in a risk-adjusted model could attenuate the measure's ability to characterize the quality of care delivered by hospitals. YNNHSC/CORE has previously reviewed every CMS-CC and identified those which, if they occur during the index hospitalization, would be considered potential complications rather than comorbidities. For example: fluid, electrolyte or base disorders; sepsis; and acute liver failure are all examples of CMS-CCs that could potentially be complications of care (see Appendix D – Conditions that are treated as complications if occurring during index admission for the complete list). For the HWR measure, we applied this pre-established list to all potential risk variables. CMS-CCs on this list were not counted as a risk factor in our analyses if they appeared only on the index admission. In the future, it may be possible to use "present on admission" codes to differentiate between comorbidities and complications during the index admission.

2.5.3 Case mix adjustment: comorbid risk variables

We used CMS-CCs, the grouper used in previous CMS risk-standardized outcomes measures, to group ICD-9-CM codes into comorbid risk adjustment variables, since four

CMS condition-specific claims-based readmission models that use this grouper to define variables for risk adjustment have been validated against models that use medical record-abstracted data for risk adjustment.^{5,7,8} We decided to use a fixed, common set of variables in all our models for simplicity and ease of data collection and analysis. We describe below the steps for variable selection:

- a. We developed a “starter” set of 30 variables drawn from previous readmission measures (AMI, heart failure, pneumonia, hip and knee arthroplasty, and stroke). In many cases, these variables included multiple CMS-CCs each.
- b. Next we reviewed all the remaining CMS-CCs and determined on a clinical basis whether they were likely to be relevant to an all-condition measure. We selected 11 additional CMS-CCs to consider. (See Appendix E –Candidate comorbid risk variables for complete set of starter variables).
- c. Using data from the index admission and any admission in the prior 12 months, we ran a standard logistic regression model for every discharge condition category with the full set of candidate risk adjustment variables. We compared odds ratios for different variables across different condition categories (excluding condition categories with fewer than 700 readmissions due to the number of events per variable constraints.⁴³) We selected the final set of risk variables based on the following principles:
 - i. We excluded risk variables that were statistically significant for very few condition categories, given that they would not contribute much to the overall models.
 - ii. We excluded risk variables that behaved in clinically incoherent ways. For example, we dropped risk factors that increased risk for some condition categories and decreased risk for others, when we could not identify a clinical rationale for the differences.
 - iii. We excluded risk variables that were predominantly protective when we felt this protective effect was not clinically reasonable but more likely reflected coding factors. For example, drug/alcohol abuse without dependence (CC 53) and delirium and encephalopathy (CC 48) were protective for readmission risk although clinically they should increase patients’ severity of illness. It is possible these variables appeared falsely protective because they were coded more often in healthier patients who had few other comorbidities than in sicker patients who had more competing comorbidities to include in the billing form.
 - iv. Where possible, we combined risk variables that were clinically coherent and carried similar risks across condition categories. For example, we combined coronary artery disease (CCs 83-84) with cerebrovascular disease (CCs 98, 99, and 103).
 - v. We examined risk variables that had been combined in previous CMS publicly reported measures, and in one instance separated them: for cancers, the previous measures generally pool 5 categories of cancers (CCs 8 to12), together. In our analysis, lung cancer (CC 8) and other severe cancers (CC 9) carried higher risks, so we separated them into a distinct risk variable and grouped other major cancers (CC 10), benign cancers (CC 11), and cancers of the urinary and GI tracts (CC 12)

together. Consistent with other publicly reported measures, we also left metastatic cancer/leukemia (CC 7) as a separate risk variable.

The final list containing 74 CMS-CCs, grouped into 31 risk variables, is shown in Appendix F – Final comorbid risk variables.

2.5.4 Service mix adjustment: condition risk variables

For all condition categories with sufficient volume (defined as those with more than 1,000 admissions nationally each year), we included a condition-specific indicator in the model.

Rationale: Condition categories differ in their baseline readmission risks and hospitals will differ in their relative distribution of these condition categories (service mix) within each cohort. Therefore, adjusting for condition categories levels the playing field across hospitals with different service mixes.

2.6 Statistical Approach to Measure Development

We used a full year of admission data from 2008, with 12 months history data, to create the specialty cohorts and select risk variables. To assess reliability of the models' performance, we combined 2007 and 2008 data, randomly split this dataset and ran the models on each split sample. We also validated the performance of the models using 2009 data.

2.6.1 Models for each cohort of conditions

For model development we used logistic regression models with a logistic link function, with outcome Y_i for the i^{th} patient equal to 1 if the patient was readmitted within 30 days of discharge and 0 otherwise. In contrast with the final models described below for calculating the measure, logistic regression models are substantially less computationally intensive, and development using models with fully specified error structures would have taken prohibitively long. Also, by using logistic regression models, we were able to assess risk factors and model performance without reference to the variation in performance across hospitals.

For our final models we extended the logistic regression models to include an additional error term. That is, due to the natural clustering of observations within hospitals, we used hierarchical logistic regression to model the log-odds of readmission for each of the five cohorts.⁴⁴ Readmission within 30 days was modeled as a function of patient-level demographic and clinical characteristics and a random hospital-level intercept. This model specification accounts for within-hospital correlation of the observed outcomes and models the assumption that underlying differences in quality among the health care facilities being evaluated lead to systematic differences in outcomes. We estimated a separate hierarchical logistic regression model for each specialty cohort.

Specifically, for a given specialty cohort, we estimated a hierarchical logistic regression model as follows. Let Y_{ij} denote the outcome (equal to 1 if patient i is readmitted within 30 days, zero otherwise) for a patient in cohort $C \subseteq \{1, \dots, 5$ at hospital j ; \mathbf{Z}_{ij} denotes a set of risk factors. Let M denote the total number of hospitals and m_j the number of index patient stays in hospital j . We assume the outcome is related linearly to the covariates via a logit function with dispersion:

$$\text{logit}(\text{Prob}(Y_i = 1)) = \alpha_j + \boldsymbol{\beta}^* \mathbf{Z}_{ij} + \varepsilon_i \quad (1)$$

$$\alpha_j = \mu + \omega_j; \omega_j \sim N(0, \tau^2)$$

where $\mathbf{Z}_{ij} = (Z_1, Z_2, \dots, Z_k)$ is a set of k patient-level covariates. α_j represents the hospital specific intercept; μ is the adjusted average outcome over all hospitals; and τ^2 is the between hospital variance component and $\varepsilon \sim N(0, \sigma^2)$ captures any over- or under-dispersion. The hierarchical logistic regression model for each cohort was estimated using the SAS software system (GLIMMIX procedure).

2.6.2 Hospital performance reporting

The previous section describes how the models for each specialty cohort are specified and estimated, using a separate hierarchical logistic regression model for that cohort. Each model is then used to calculate a standardized risk ratio (SRR) for each hospital which contributes index admissions to that model. These SRRs, weighted by volume, are then pooled for each hospital to create a composite hospital-wide SRR.

Standardized risk ratio for each specialty cohort

We used the results of each hierarchical logistic regression model to calculate the predicted number of readmissions and the expected number of readmissions at each hospital. The predicted number of readmissions in each cohort was calculated, using the corresponding hierarchical logistic regression model, as the sum of the predicted probability of readmission for each patient, including the hospital-specific (random) effect. The expected number of readmissions in each cohort for each hospital was similarly calculated as the sum of the predicted probability of readmission for each patient, ignoring the hospital specific (random) effect. Using the notation of the previous section, the model specific risk standardized readmission ratio is calculated as follows. To calculate the predicted number of admissions pred_{Cj} for index admissions in cohort $C=1, \dots, 5$ at hospital j , we used

$$\text{pred}_{Cj} = \sum \text{logit}^{-1}(\alpha_j + \boldsymbol{\beta}^* \mathbf{Z}_{ij}) \quad (2)$$

where the sum is over all m_{Cj} index admissions in cohort C with index admissions at hospital j . To calculate the expected number exp_{Cj} we used

$$\text{exp}_{Cj} = \sum \text{logit}^{-1}(\mu + \boldsymbol{\beta}^* \mathbf{Z}_{ij}) \quad (3)$$

Then, as a measure of excess or reduced readmissions among index admissions in cohort C at hospital j , we calculated the standardized risk ratio SRR_{Cj} as

$$\text{SRR}_{Cj} = \text{pred}_{Cj} / \text{exp}_{Cj} \quad (4)$$

Risk-standardized hospital-wide 30-day readmission rate

To report a single readmission score, the separate specialty cohort SRRs were combined into a single value. We created a single score as follows.

For a given hospital, j , which has patients in some subset of cohorts $C \subseteq \{1, \dots, 5\}$, calculate the SRR as described above for each specialty cohort for which the hospital discharged patients. If the hospital does not have index admissions in a given cohort c , then $m_{cj} = 0$ and we take $\text{SRR}_{cj} = 1$. Then, calculate the volume-weighted logarithmic mean:

$$SRR_j = \exp((\sum m_{cj} \log(R_{cj})) / \sum m_{cj}) \quad (5)$$

where the sums are over all specialty cohorts; note that if a hospital does not have index admissions in a given cohort ($m_{cj} = 0$) then that cohort contributes nothing to the overall score SRR_j . **This value, SRR_j , is the hospital-wide standardized risk ratio** for hospital j . To aid interpretation, this ratio is then multiplied by the overall national raw readmission rate for all index admissions in all cohorts, \bar{Y} , to produce **the risk-standardized hospital-wide readmission rate (RSRR_j)**.

$$RSRR_j = SRR_j * \bar{Y} \quad (6)$$

2.6.3 Creating interval estimates

Because the statistic described in Equation (5) is a complex function of parameter estimates, we used re-sampling and simulation techniques to derive an interval estimate for the final risk-standardized rate to characterize the uncertainty of the estimate. The bootstrapping simulation has the advantage of avoiding unnecessary distributional assumptions.

Algorithm

Let M denote the total number of hospitals in the sample. We repeat steps 1 – 4 below for $b = 1, 2, \dots, B$ times:

1. Sample M hospitals with replacement.
2. Fit the five cohort hierarchical logistic regression models using all patients within each sampled hospital. We use as starting values the parameter estimates obtained by fitting the model to all hospitals. If some hospitals are selected more than once in a bootstrapped sample, we treat them as distinct so that we have M random effects to estimate the variance components. At the conclusion of Step 2, we have:
 - a. $\beta^{(b)}$, the vector of coefficients, and the corresponding variance covariance matrix \mathbf{V} .
 - b. $\mu^{(b)}$, the average hospital rate; $\tau^{2(b)}$, the between hospital variance, and
 - c. the set of hospital-specific intercepts and corresponding variances; $\{\alpha_j^{(b)}, \text{var}[\alpha_j^{(b)}] : j = 1, 2, \dots, M\}$
3. We generate a hospital random effect by sampling from the distribution of the hospital-specific distribution obtained in Step 2c. We approximate the distribution for each random effect by a normal distribution. Thus, we draw $\alpha_j^{(b*)} \sim N(\alpha_j^{(b)}, \text{var}[\alpha_j^{(b)}])$ for the unique set of hospitals sampled in Step 1.
4. Within each unique hospital j sampled in Step 1, and using index admissions $i=1, \dots, m_j$ in that hospital, we calculate SRR_j^* and then $RSRR_j^*$ as in equations (5) and (6).

Ninety-five percent interval estimates (or alternative interval estimates) for the hospital-standardized outcome can be computed by identifying the 2.5th and 97.5th percentiles of

randomly half of the B estimates (or the percentiles corresponding to the alternative desired intervals).

3. RESULTS

3.1 Risk Variables

As described earlier, we developed five separate models, one for each specialty cohort. Table 9 to Table 13 show the full list of risk variables for each model, including the frequency in the dataset, and the odds ratio with 95% confidence intervals for readmission risk. Results were calculated using logistic regression models. Each table shows results for a single model. Each table contains results from two datasets: one used for development and the other used for validation. We pooled data from 2007 and 2008 and randomly split the dataset into two parts, a development sample and a validation sample. In each table, risk variables whose confidence intervals did not overlap in the development and validation samples are in bold. In general, condition risk variables were much more strongly associated with readmission than comorbidity risk variables.

Table 9 – Medicine model, risk variable frequencies, and odds ratios by sample datasets

3.2 Assessment of Risk Adjustment

Table 14 to Table 18 summarize each model's performance. For assessment of risk adjustment, we used two validation samples: one from the split-sample 2007-2008 data as described in Section 3.1, and a second validation sample using data from 2009. The latter dataset allows us to determine how reliable our models are year to year. For each logistic regression model, we computed five summary statistics to assess model performance: calibration (a measure of over-fitting),⁶ discrimination in terms of predictive ability, discrimination in terms of c statistic (equivalent to area under the receiver operating curve [ROC]), distribution of residuals, and model chi-square.

Over-fitting refers to the phenomenon in which a model describes the relationship between predictive variables and outcome well in the development dataset, but fails to provide valid predictions in new patients. Since the γ_0 in the validation sample is close to zero and the γ_1 is close to one in each of the models, there is little evidence of over-fitting.

Discrimination in predictive ability measures the ability to distinguish high-risk subjects from low-risk subjects. Therefore, we would hope to see a wide range between the lowest decile and highest decile, which these models show.

The c statistic is a measure of how accurately a statistical model is able to distinguish between a patient with and without an outcome. For binary outcomes the c statistic is identical to the ROC. A c statistic of 0.50 indicates random prediction, implying all patient risk factors are useless. A c statistic of 1.0 indicates perfect prediction, implying patients' outcomes can be predicted completely by their risk factors, and physicians and hospitals play no role in patients' outcomes. While higher c statistic is desirable, we do not want to maximize it by adjusting for factors that should not be adjusted for. For example, we do not want to include in-hospital complications as a risk factor. The range of c statistic results is 0.613 to 0.675 which is in line with results we have seen for other 30-day readmission measures.

Table 14 – Medicine model performance (logistic regression)

Indices	2007-2008 Development Sample	2007-2008 Validation Sample	2009 Validation Sample
Number of hospital stays	3,085,962	3,082,357	3,032,518
Number of hospitals	4,954	4,946	4,908
Unadjusted readmission rate	18.0%	18.0%	18.1%
Calibration (γ_0, γ_1)	(0, 1)	(0.011, 1.006)	(0.132, 1.118)
Discrimination -Predictive Ability (lowest decile %, highest decile %)	9 – 34	9 – 34	7 – 36
Discrimination – c statistic	0.640	0.641	0.663

⁶ Over-Fitting Indices (γ_0, γ_1) provide evidence of over-fitting and require several steps to calculate. Let b denote the *estimated vector* of regression coefficients. *Predicted Probabilities* (\hat{p}) = $1/(1+\exp\{-Xb\})$, and $Z = Xb$ (e.g., the linear predictor that is a scalar value for everyone). A new logistic regression model that includes only an intercept and a slope by regressing the logits on Z is fitted in the validation sample; e.g., $\text{Logit}(P(Y=1|Z)) = \gamma_0 + \gamma_1 Z$. Estimated values of γ_0 far from 0 and estimated values of γ_1 far from 1 provide evidence of over-fitting.

Distribution of residuals (Pearson Residual Fall %)

3.3 Composite Measure Testing

3.3.1 Number of models per hospital

The HWR measure is a composite score derived from the results of five separate specialty cohort models; however, hospitals need not have index admissions in every specialty cohort to have a composite score (see Section 2.6.2). The SRR for a specialty cohort is not included in the composite score for a hospital if that hospital has no patients in that specialty cohort. In Table 19 we categorize hospitals by the number of cohorts to which they contribute index admissions in the 2007-8 development data. For example, in this dataset, 83.4% of hospitals had at least one index admission in all five specialty cohorts while 1.4% of hospitals had index admissions in only one specialty cohort.

Table 19 – Number of specialty cohorts for which hospitals have at least one index admission

Number of Models for which the Hospital has at Least One Included Patient	Number of Hospitals	Percentage of Hospitals	Cumulative %
5	4,147	83.4%	83.4%
4	493	9.9%	93.2%
3	143	2.9%	96.1%
2	123	2.5%	98.6%
1	72	1.4%	100.0%

3.3.2 Internal consistency of overall composite score

To assess how well the specialty cohort SRRs fit together, we calculated the weighted correlation among the specialty cohort SRRs. If these condition SRRs are relatively homogeneous, measuring a similar underlying factor, the correlation among these SRRs should be high. Our results showed correlation coefficients ranging from 0.35 (neurology and cardiovascular) to 0.65 (medicine and cardiorespiratory), with correlation coefficients among the three largest specialty cohorts all above 0.5. This provided good evidence that there is a consistent underlying factor for readmission risk across all these cohorts. We do not expect perfect correlation since we expect there to be specialty-specific factors contributing to readmission risk.

Table 20 – Weighted correlation among the SRRs for each specialty cohort

Pearson Correlation Coefficients, N = 4147 Prob > r under H0: Rho=0					
	Medicine	Surgery/ gynecology	Cardiovascular	Cardiorespiratory	Neurology
Medicine	1.00000	0.60886 <.0001	0.51418 <.0001	0.64592 <.0001	0.52491 <.0001

Pearson Correlation Coefficients, N = 4147 Prob > r under H0: Rho=0					
	Medicine	Surgery/ gynecology	Cardiovascular	Cardiorespiratory	Neurology
Surgery/ gynecology	0.60886 <.0001	1.00000	0.44109 <.0001	0.53653 <.0001	0.47020 <.0001
Cardiovascular	0.51418 <.0001	0.44109 <.0001	1.00000	0.48269 <.0001	0.34635 <.0001
Cardiorespiratory	0.64592 <.0001	0.53653 <.0001	0.48269 <.0001	1.00000	0.43456 <.0001
Neurology	0.52491 <.0001	0.47020 <.0001	0.34635 <.0001	0.43456 <.0001	1.00000

To assess the overall internal consistency of the specialty cohort SRRs, we calculated Cronbach's coefficient α . This coefficient reflects the proportion of total variance in the summated scale composite score that is accounted for by a common source among the condition measures. Theoretically α varies from 0 to 1, since it is the ratio of two variances. Cronbach's α generally increases as the intercorrelations among components increase, although it is also affected by factors such as the number of contributing items. Therefore, higher values of α are more desirable. The composite score we derived is a geometric mean, not an arithmetic mean. We used Cronbach's α as an approximate measure of internal consistency.

Using data from the 4,147 hospitals with index admissions in every specialty cohort, we calculated Cronbach's α for the global measure to be 0.83, indicating good internal consistency of the condition SRRs.⁴⁵

In addition, we also calculated the correlation between each specialty cohort SRR with the composite SRR (Table 21). In all cases, the correlation of each specialty cohort with the overall score was greater than 0.59.

Table 21 – Correlation of condition SRRs with composite SRRs

Model	Correlation with overall composite score
Medicine	0.914

3.4 Final Model Results

3.4.1 Distribution of standardized risk ratios

We estimated a separate hierarchical logistic regression model for each specialty cohort, using the development sample, and calculated the SRR as described in Section 2.6.2. Figure 3 shows the distribution of the overall SRR derived from the volume-weighted pooled results of the five specialty cohorts, as well as the distribution of SRRs for each one of the specialty cohorts. These results are also summarized in Table 22.

Figure 3 – Distributions of the overall (pooled) SRR and the SRRs derived from each of the five models

Table 22 – Distribution of standardized risk ratios: hierarchical logistic regression results for the 2007-2008 development sample

	Mean	SD	Min	10 th Pctl	Lower Quartile	Median	Upper Quartile	90 th Pctl	Max
SRR Combined	1.00	0.07	0.75	0.92	0.96	0.99	1.04	1.09	1.36
SRR Medicine	1.00	0.09	0.75	0.90	0.94	0.99	1.05	1.12	1.51
SRR Surgery	1.00	0.08	0.73	0.91	0.96	1.00	1.04	1.10	1.52

---------------	------	------	------	------	------	------	------	------	------

3.4.2 Distribution of unadjusted and adjusted readmission rate

We calculated the frequency distributions of the unadjusted and risk-standardized hospital-level, 30-day readmission rates across the 4742 hospitals with at least 25 index admissions, using the development dataset. We excluded hospitals with fewer than 25 cases total across the five models, since estimates for hospitals with fewer cases are less reliable, and CMS' past approach to public reporting has been not to report these results.

Table 23 and Figure 4 show the distribution of overall unadjusted and RSRRs. The unadjusted readmission rates ranged from 0% to 36.56%, with a median of 16.26% and an interquartile range of 14.01-18.64. The mean \pm SD hospital unadjusted readmission rate was 16.35% \pm 4.20. The RSRRs had a much narrower range, from 12.58% to 22.76%, with a median of 16.58% and an interquartile range of 15.96-17.30. The mean \pm SD hospital RSRR was 16.69% \pm 1.15%.

Table 23 – Distribution of unadjusted and adjusted readmission rate, results for the 2007-2008 development sample

Composite readmission rate	Mean	SD	Min	10th Pctl	Lower Quartile	Median	Upper Quartile	90th Pctl	Max
Unadjusted	16.35	4.20	0.00	11.66	14.01	16.26	18.64	21.21	36.56
Risk-standardized	16.69	1.15	12.58	15.39	15.96	16.58	17.30	18.20	22.76

Figure 4 – Distribution of 30-day hospital-wide unadjusted and adjusted readmission rates

Source: 2007-2008 development data, volume ≥ 25

3.4.3 Test-retest reliability of RSRR

To determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance, we calculated the RSRR using each half of the split-sample 2007-2008 data. Thus, we obtain two RSRRs for each hospital, using an entirely distinct set of patients from the same time period. To the extent that the calculated measures of these two subsets agree, we have evidence that the measure is assessing an attribute of the hospital, not of the patients. As a metric of agreement we calculated the intra-class correlation as defined by ICC (2,1) by Shrout and Fleiss (1979).⁴⁶ The agreement between the two independent assessments of each hospital was 0.881, which according to the conventional interpretation is “almost perfect.”⁴⁷

3.5 Validity testing

3.5.1 Validity of risk adjustment approach

Our team has demonstrated for a number of prior measures the validity of claims-based measures for profiling hospitals by comparing either the measure results or individual data elements against the corresponding results and elements from medical records. CMS validated the six NQF-endorsed measures currently in public reporting (AMI, heart failure,

and pneumonia mortality and readmission) with models that used chart-abstracted data for risk-adjustment. Specifically, claims model validation was conducted by building comparable models using abstracted medical chart data for risk adjustment for AMI patients (Cooperative Cardiovascular Project data),⁴ heart failure patients (National Heart Failure data),^{5,48} and pneumonia patients (National Pneumonia Project dataset).⁶ When both models were applied to the same patient population, the hospital risk-standardized rates estimated using the claims-based risk adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting.

We have also completed two national, multi-site validation efforts for two procedure-based complications measures (for primary elective hip/knee arthroplasty and implantable cardioverter defibrillator [ICD]). Both projects demonstrated strong agreement between complications coded in claims and abstracted medical chart data. These validation efforts suggest that such claims data variables are valid across a variety of conditions.

3.5.2 Validity of development process

We developed this measure in consultation with national guidelines for publicly reported outcomes measures, with outside experts, and with the public. The measure is consistent with the technical approach to outcomes measurement set forth in National Quality Forum (NQF) guidance for outcomes measures,³⁶ CMS Measure Management System guidance, and the guidance articulated in the American Heart Association scientific statement, “Standards for Statistical Models Used for Public Reporting of Health Outcomes.”³

3.5.3 Construct validity

In order to test the construct validity of the HWR measure, we examined whether hospitals considered “top performers” according to other measures and ranking systems had lower hospital-wide risk-standardized readmission rates than remaining hospitals. This type of validity testing is more relevant than face validity and tests the assumption that hospitals considered top performers have developed an organizational culture of excellence that will manifest itself in better outcomes including lower hospital-wide readmission rates. However, there are multiple challenges associated with this approach:

1. There are many measures and ranking systems available, using a variety of criteria in order to define and select top performers, including: adherence to core processes of care, complications and safety indexes, resource utilization, outcomes, patient satisfaction, and even reputation. “Top performers” on one measure are not the same as “top performers” on another. Moreover, most of these measures are not themselves validated.
2. In many cases, the methodology for identifying “top performers” is proprietary and not transparent.
3. The starting set of hospitals from which different ranking systems select the top performers usually includes only a subset of all acute care hospitals included in the HWR measure; in most cases it is not possible to replicate this starting set exactly.
4. We have not found a ranking system which specifically measures factors most relevant to readmission risk, such as medication reconciliation, patient education, post-discharge follow up, or communication with outpatient clinicians.

After reviewing ranking systems, we selected the following three to use for construct validity testing, because they are widely used and their methodology is available to the public:

1. HCAHPS survey score (<http://www.hcahpsonline.org/home.aspx>)
2. Thomson Reuters 100 top hospitals (<http://www.100tophospitals.com/top-national-hospitals/>)
3. Joint Commission list of Top Performers on Key Quality Measures (http://www.jointcommission.org/assets/1/18/Top_Performers_2010_list_9_13_11.pdf)

Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)

From the 27 questions in the HCAHPS survey, we selected seven that we felt were most likely to be correlated with readmission rates, based on clinical judgment and on previously reported results by others.⁴⁹ Based on previous results we expected to see that patient satisfaction is significantly correlated with hospital readmission rates. For this analysis, we compared 2009 HCAHPS results to 2009 RSRRs. Table 24 shows the Pearson correlation coefficient between RSRR and the proportion of patients who responded in that given manner to the question. The analysis includes the 3,723 hospitals that publicly report HCAHPS results. The results indicate that all the negative answers were significantly correlated with readmission rates - that is, that lower patient satisfaction is associated with higher RSRR, as expected.

Table 24 – Correlation between RSRR and HCAHPS response (N=3,723 hospitals)

HCAHPS Question	Correlation*
Pain was 'sometimes' or 'never' well controlled	0.34
Patients 'sometimes' or 'never' received help as soon as they wanted	0.34
Nurses 'sometimes' or 'never' communicated well	0.33
'NO' patients would not recommend the hospital	0.32
Patients were 'sometimes' or 'never' given information about what to do during their recovery at home	0.32
Patients who gave a rating of '6' or lower	0.31
Doctors 'sometimes' or 'never' communicated well	0.23

*p<0.001 for all correlations

Thomson Reuters Top 100 Hospitals

Thomson Reuters annually names 100 Top Hospitals based on facility-wide performance among short-term, acute-care, nonfederal U.S. hospitals. Hospitals do not apply and winners do not pay to market this honor. Critical access hospitals are excluded. Data sources include the MedPAR dataset, the Medicare Cost Report, HCAHPS survey data, core measures from CMS Hospital Compare dataset, the American Medical Association, and the American Osteopathic Association (AOA). The top performers are selected based on a set of measures including:

- Risk-adjusted mortality index
- Risk-adjusted complications index

- Risk-adjusted patient safety index
- Core measures score
- 30-day mortality rate
- 30-day risk-adjusted readmission rate
- Severity-adjusted average length of stay
- Case mix- and wage-adjusted inpatient expense per adjusted discharge
- Profitability (operating profit margin)
- HCAHPS score (patient rating of overall hospital performance)

They also incorporate the direction of performance change over time. Given that this measure includes several elements theoretically related to readmission risk, including complications, patient safety, readmissions, and HCAHPS, we felt this measure was a reasonable candidate for construct validity testing. However, since the measure also contains other components such as core measures, expenses and profitability that would not be expected to correlate with readmission, we expected the analysis to show at best small improvements in readmission performance among top performers. Table 25 shows the RSRRs distribution for the top performers in comparison to the rest of hospitals. The mean RSRR for the top performers is lower than the mean RSRR for hospitals not on the list (16.19 versus 16.65). The magnitude of difference is approximately 0.5%, as we had expected, and in the right direction.

Table 25 – Distribution of RSRR for the Thomson Reuters Top 100 Hospitals versus Others

Top 100 list	N Obs	Mean	Std Dev	Minimum	Lower Quartile	Median	Upper Quartile	Maximum
No	3,017	16.65	1.28	12.51	15.79	16.51	17.35	22.69
Yes	100	16.19	1.39	13.77	15.05	16.06	16.99	19.81

The Joint Commission’s Top Performers on Key Quality Measures program

The Top Performers on Key Quality Measures program recognizes accredited hospitals and critical access hospitals that have consistently superior performance (>95%) on clinical process measures for heart attack, heart failure, pneumonia, surgical care and children’s asthma. In 2011, 405 hospitals were recognized, which represent the top 14 percent of Joint Commission accredited hospitals reporting data. Of the Joint Commission’s top performers list, we selected only those 158 hospitals with superior performance in *all four* adult measure sets (HWR is for patients 18 years and older), on the assumption that these hospitals demonstrated hospital-wide performance excellence. We calculated their hospital-wide readmission rates and compared them to those of other hospitals.

Numerous studies have shown that there is little relationship between performance on core process measures and outcomes including mortality and readmission rates.⁵⁰⁻⁵⁵ Therefore we expected the Joint Commission’s top performers to have similar risk-standardized readmission rates as other hospitals. The table below shows the distribution of risk-standardized readmission rates of the 158 top performers compared to others. Of the Joint Commission’s list of 405 top performers, we selected only those 158 hospitals with superior performance in *all four* adult measure sets (HWR is for patients 18 years and older), on the assumption that these hospitals demonstrated hospital-wide performance excellence. We calculated their hospital-wide readmission rates and compared them to those of other hospitals. See results in Table 26. The mean RSRR for Joint Commission top performing

hospitals was 16.66 versus 16.61 for the remaining hospitals in our measure cohort. The absence of difference was consistent with our *a priori* expectation based on published studies.

Table 26 - Distribution of RSRR for The Joint Commission's Top Performers versus Others

Top Performers List	N Obs	Mean	Std Dev	Minimum	Lower Quartile	Median	Upper Quartile	Maximum
Not in List	4,630	16.61	1.16	12.51	15.87	16.49	17.21	22.69
In List	158	16.66	0.99	14.18	16.01	16.64	17.17	19.91

In summary, these three construct validity analyses demonstrated results consistent with our expectations. There is a significant correlation between patient satisfaction and RSRR as measured by HWR measure. “Top performers” as defined by Thomson Reuters have lower RSRRs as measured by HWR measure. On the other hand, hospitals identified by The Joint Commission as having superior performance on all four categories of clinical process measures have identical performance as those with lower performance, consistent with published studies.

4. SUMMARY

In this measure methodology report, we present a measure for 30-day all-cause readmission following hospitalization for any condition that is based on administrative claims data for FFS Medicare beneficiaries 65 years and older. Admissions for medical cancer treatment and for conditions not typically cared for in acute care hospitals are excluded. The measure excludes planned readmissions as an outcome, since they are not a signal of care quality.

The measure is comprised of five hierarchical logistic regression models, each of which includes a specialty cohort consisting of a clinically coherent group of admissions. The measure includes adjustment for case mix (patient comorbidity) and service mix (types of conditions and procedures cared for by the hospital). We excluded covariates that are not appropriate for inclusion in a quality measure such as race, socioeconomic status, and hospital-level factors (e.g., hospital bed size or teaching status). Our approach to model development and risk adjustment is consistent with quality measure methods recommendations for publicly reported outcomes measures from NQF, CMS, and the American Heart Association scientific statement. The hierarchical modeling accounts for hospital case mix and service mix; the clustering of patients within hospitals; and differences in sample size across hospitals, thereby making the measure suitable for public reporting. The measure will also be tested with all-payer data and modified as necessary to apply to the full spectrum of adult hospitalized patients.

This measure includes 93.1% of admissions to acute care non-federal hospitals of Medicare FFS patients over age 65 who are discharged alive to the non-acute care setting. The measure captures 92.1% of readmissions following eligible admissions. A total of 83% of hospitals have admissions in every specialty cohort, and c statistics for performance of each model are consistent with those of models for other publicly reported measures. The overall raw readmission rate is 16.4% (range 0% to 36.6%); our risk-standardized measure has a similar mean of 16.7% but narrows the range to 12.6%-22.8%, indicating adjustment for case mix and service mix. We have tested the measure across multiple years of data and found the results to be consistent. The measure has external validity as demonstrated by correlation with other measures of hospital quality. These characteristics make the measure suitable for public reporting.

rv45	158	Hip fracture/dislocation	

Results of all-payer testing

Hospital-wide all-cause unplanned readmission measure

The hospital-wide all-cause unplanned readmission measure (HWR) was developed and validated using administrative claims data for Medicare fee-for-service (FFS) beneficiaries aged ≥ 65 . To determine the performance of the HWR measure when applied to admissions for adults aged ≥ 18 regardless of insurance type (“all-payer data”), we obtained inpatient administrative claims from all hospitals in the state of California during 2005-2007.

Data source and cohort

California is a diverse state, and, with more than 37 million residents, it represents 12% of the US population. We used the California Patient Discharge Data (CPDD), a large database of patient hospital admissions, for our all-payer data. In 2006, these data include approximately 3 million adult discharges from more than 450 non-Federal acute care hospitals. Records are linked by a unique patient identification number, allowing us to determine patient history from previous hospitalizations and track readmissions.

Inclusion/exclusion criteria

After applying the same inclusion and exclusion criteria that we applied to national Medicare data (with minor modifications as noted below), the California dataset included 1,969,861 eligible admissions. Because the HWR measure was specified without obstetric admissions, obstetric admissions were similarly excluded from the CPDD, accounting for approximately 500,000 excluded admissions. Thus, in order to apply the HWR measure to the CPDD, we made the following changes to our initial specification of inclusion and exclusion criteria:

- We changed the minimum eligible age from 65 to 18
- We removed the requirement to be enrolled in Medicare FFS
- We explicitly excluded patients admitted for obstetric diagnoses

Risk adjustment

The dataset included a full year of historical inpatient claims data, enabling us to perform the same risk adjustment as we did using national Medicare data. However, the CPDD includes up to 24 secondary diagnosis codes per patient, compared to 9 in Medicare national data. Thus, in applying the HWR measure to the CPDD:

- We used the 24 available diagnosis codes for comorbid risk adjustment instead of the 9 available in Medicare FFS data

- We respecified the “low frequency” discharge condition risk variables in the medicine and surgery/gynecology models. In the original Medicare FFS HWR measure, we created a low frequency discharge condition risk variable in both the medicine and surgery/gynecology models. Low frequency conditions were combined into a single “low frequency” risk variable in each of those two models. In the CPDD, some of these conditions became common enough to be assigned their own condition-specific risk variable (e.g., sickle cell disease) and were removed from the low frequency composite; others that previously had enough volume to stand alone did not and were added to the low frequency composite.

All-payer analyses

For purposes of analysis, we divided CPDD data into three cohorts based on age and insurance: Medicare FFS patients aged ≥ 65 years, all other patients aged ≥ 65 years, and all patients aged < 65 years. The Medicare FFS ≥ 65 cohort is equivalent to our original dataset, which includes only Medicare FFS patients aged ≥ 65 years.

We compared:

- 1) Unadjusted readmission rates for the five specialty cohorts in the CPDD to national Medicare FFS data
- 2) The frequencies of risk variables in patients aged < 65 , aged ≥ 65 with FFS Medicare, and aged ≥ 65 without FFS Medicare in the CPDD to national Medicare FFS data
- 3) The distribution of discharge condition categories in patients aged < 65 , aged ≥ 65 with FFS Medicare, and aged ≥ 65 without FFS Medicare in the CPDD to one another
- 4) The performance of models using CPDD data to the performance of models using national FFS Medicare data
- 5) The performance of models using CPDD data to the performance of models in which 31 interactions of age ≥ 65 * each comorbid risk variable were added to each specialty cohort model. This analysis allowed us to determine whether comorbid risk variables behave differently in younger versus older patients.

Results of these five analyses are summarized here and provided in detail in the attached tables.

Unadjusted readmission rates (Table 1-6)

- In all five specialty cohorts, unadjusted readmission rates for Medicare FFS patients aged ≥ 65 in the CPDD from 2006 were very similar to unadjusted readmission rates for Medicare FFS patients aged ≥ 65 admitted to California hospitals in CMS national data from 2007, indicating that the CPDD data appropriately captured Medicare patients.
- In all five specialty cohorts, unadjusted readmission rates were highest in Medicare FFS patients aged ≥ 65 , and lowest in patients aged < 65 , as expected.

Frequencies of comorbid risk variables (Table 7-11)

- In all five specialty cohorts, the frequencies of risk variables in California Medicare FFS patients aged ≥ 65 were very similar to those in national Medicare FFS patients, even though the CPDD includes many more comorbidity codes.
- In all five specialty cohorts, comorbid risk variable frequency in California Medicare FFS patients aged ≥ 65 was similar to comorbid risk variable frequency in all other California patients aged ≥ 65 .
- Younger CPDD patients had different rates of comorbid illness than older CPDD patients in all five specialty cohorts. Younger patients, for example, had much higher rates of alcohol and substance abuse and lower rates of cardiovascular disease.

Frequencies of discharge condition categories (Table 12-16)

- In all five specialty cohorts, the distribution of discharge conditions within specialty cohorts was similar for California Medicare FFS patients aged ≥ 65 and all other CPDD patients aged ≥ 65 .
- Younger CPDD patients had substantially different distributions of disease than older CPDD patients in all five specialty cohorts. For example, in the cardiovascular cohort, half the younger patients had a diagnosis of chest pain, compared to only one quarter of older patients.

Performance of the models (Table 17)

- Every specialty cohort model performed better in all-payer data than in our original derivation set using national Medicare data.

C statistic comparison across samples

Specialty cohort	2007-2008 Development Sample	2007-2008 Validation Sample	CPDD Sample
Cardiovascular model	0.657	0.656	0.715
Cardiorespiratory model	0.630	0.631	0.674
Neurology model	0.614	0.613	0.661
Medicine model	0.640	0.641	0.702
Surgical model	0.675	0.675	0.725

- Model performance for younger patients was significantly better than for patients aged ≥ 65 in every specialty cohort (Table 17)

Improvement using interaction terms (Table 17)

- Adding an interaction term of age ≥ 65 * each comorbid risk variable for every comorbid risk variable (N=31) did not appreciably improve the performance of any specialty cohort model, indicating that comorbid risk variables do not behave substantively differently for younger versus older patients

Summary

We were able to apply the HWR measure as developed in Medicare FFS patients to an all-payer population aged ≥ 18 by making minor changes to inclusion criteria, by allowing more secondary diagnoses to be counted as comorbid risk variables, and by redefining two “low frequency discharge condition category” variables. Despite substantial differences in both comorbid risk variable frequencies and disease distribution between younger and older patients, we observed little difference in risk variable performance between younger and older patients. Models performed better in younger than in older patients. Overall, model performance was *better* in these all-payer data than in Medicare FFS ≥ 65 data. Based on these analyses, we conclude that the HWR measure can be applied to an adult all-payer population.

Condition categories marked in bold have approximately a twofold difference or greater in frequency between patients <65 and >= 65.

46 conditions with <100 admissions omitted from this table for the sake of brevity (total 1,841 cases excluded)

Model with age interaction

Table 17. Specialty cohort model performance, California data 2006

AIC: Akaike Information Criterion. The AIC measures the goodness of fit of the model. Lower values indicate better fit.

IDI: Integrated Discrimination Index. The IDI compares the ability of two models to discriminate high risk from low risk admissions. The higher the IDI, the greater the improvement in discrimination ability with the new model. The IDI is calculated as A-B, where A=(mean estimated probability of those readmitted based on the model with interaction terms – mean estimated probability of those readmitted based on the model without interaction terms) and B=(mean estimated probability of those not readmitted based on model with interaction terms – mean estimated probability of those not readmitted based on the model without interaction terms).
